A REPRINT

OF THE LAST (1880) EDINBURGH AND LONDON EDITION

OF CHAMBERS'S ENCYCLOPÆDIA,

With Copious Additions by American Editors.

FIFTEEN VOLUMES,

VOLUME IV.

NEW YORK:
AMERICAN BOOK EXCHANGE,
764 BROADWAY
1881

AMERICAN PUBLISHER'S NOTICE.

THIS work, although based upon Chambers's Encyclopædia, whose distinguished merit is widely known, differs from it in important respects. It could scarcely be expected that an Encyclopædia, edited and published for a foreign market, would give as much prominence to American topics as American readers might desire. To supply these and other deficiencies the American Editors have inserted about 15,000 titles, arranging the whole, including Chambers's Supplement, in a single alphabet. The total number of titles is now about 40,000. The additions give greater fullness in the departments of biography, geography, history, natural history, and general and applied science. Scrupulous care has been taken not to mutilate or modify the original text of the edition of 1880; no changes have been made except such verbal alterations as are required by the omission of the wood-cuts. The titles of articles from Chambers's Encyclopædia, either from the main work or from the Supplement, are printed in bold-faced type—**AMERICA.** The titles of the American additions, whether of new topics or of enlargements of the old, are printed in plain capitals—AMERICA. Should it appear that an article from the English work and its American continuation disagree in any points, the reader will readily refer the conflicting statements to their proper sources.

The labor of consultation will be much reduced by the catch-words in bold-faced type at the top of the page, being the first and last titles of the pages which face each other; and by the full title-words on the back of the volume, being the first and last titles contained therein.

The word *ante* refers to Chambers's Encyclopædia, as represented in this issue. Whenever the word (*ante*) follows a title in the American additions, it indicates that the article is an enlargement of one under the same title in Chambers's Encyclopædia—usually to be found immediately preceding.

THE AMERICAN BOOK EXCHANGE.

CIRCULATION, in anatomy and physiology, is the term used to designate the course of the blood from the heart to the most minute blood-vessels (the capillaries, q.v.), and from these back to the heart.

To simplify the consideration of the subject, we shall consider—1. The anatomy of the organs of circulation—and, 2. The physiology of the circulation.

1. The organs of C. consist of the heart, arteries, veins, and capillaries. The course of the blood through these organs will be best elucidated by the aid of a diagram, which is equally applicable for all other mammals as well as for man, and for birds. The shaded part of fig. 1 represents structures filled with impure or venous blood, while the unshaded portion represents structures in which pure, oxygenated, arterial blood occurs. In this diagram we observe a dotted circle, representing a closed bag or sac, termed the pericardium, and inclosing the four cavities *c*, *v*, *c'*, *v'*, of which the heart is composed. Two of these cavities, *c* and *c'*, are for the purpose of receiving the blood as it flows into the heart, and are termed the *auricles;* while the two cavities *v* and *v'* are for the purpose of propelling the blood through the lungs and general system respectively, and are termed the *ventricles.* The vessels that transport blood into the auricles are termed *veins,* and the vessels through which the blood is driven onwards from the ventricles are known as *arteries* (q.v.). The diagram further shows that what we commonly term the heart, is in reality *two distinct hearts* in apposition with each other—one, shaded in the figure, which is called the right, or venous, or pulmonary heart; and the other, unshaded, which is called the left, or arterial, or systematic heart—the last name having been given to it, because the blood is sent from it to the general system; just as the right heart is termed pulmonary from its sending blood to the lungs. We will now trace the course of the blood as indicated by the arrows in this diagram, commencing with the right auricle, *c.* The right auricle contracting upon the venous or impure blood with which we suppose it to be filled, drives its contents onwards into the right ventricle *v*, through an opening between these two cavities, called the right auriculo-ventricular opening, which is guarded by a valve named the tricuspid—from its being composed of three-pointed membranous expansions—which almost entirely prevents the regurgitation or reflux of the blood from the ventricle into the auricle. The ventricle *v* being now filled, contracts, and as the blood cannot return into the auricle, it is driven along the shaded vessel, the dividing branches of which are indicated by *f.* This vessel is known as the pulmonary artery, and conveys the blood to the lungs. At its commencement, it is guarded by valves, termed, from their shape, the semilunar pulmonary valves, which entirely prevent the blood which has once been propelled into the pulmonary artery from re-entering the ventricle. The pulmonary artery gradually divides into smaller and smaller branches, which ultimately merge into capillaries. In these capillaries, which are freely distributed over the interior of all the air-cells (of which the lung is mainly composed), the venous blood is brought in contact with atmospheric air, gives off its carbonic acid gas (which is its principal impurity), and absorbs oxygen, by which processes it is converted into pure or arterial blood. The capillaries, *b*, in which the blood is arterialized, gradually unite to form minute veins, which, again, join to form larger vessels, until finally the blood is collected into a small number of vessels known as pulmonary veins, which pour their contents into the left auricle. Only one such vessel, *g*, is shown in the figure, because the main object of this diagramatic scheme is to illustrate the mode and general direction in which the blood circulates, not to indicate

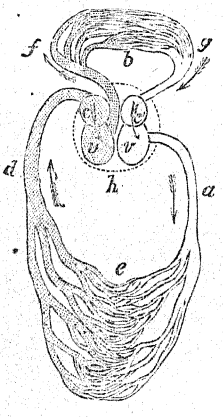

FIG. 1.—MODE OF CIRCULATION IN MAN AND OTHER MAMMALS, AND IN BIRDS.

h, heart; *v*, right ventricle; *v'*, left ventricle; *c*, right auricle; *c'*, left auricle; *a*, aorta; *d*, vena cava; *e*, greater circulation; *b*, smaller circulation; *f*, pulmonary artery; *g*, pulmonary veins.

the special vessels through which it flows in different parts of the body. The actual number of the pulmonary veins is four—viz., two from each lung. The blood, now fitted for the various purposes of nutrition, enters the left auricle, *c'*, which by its contraction propels it into the left ventricle, *v'*, through the left auriculo-ventricular opening. This opening, like the corresponding one in the right heart, is guarded by a valve which, from its form, is termed the mitral valve, and which entirely prevents the reflux of the blood. The left ventricle, *v'*, contracts and drives its contents into the large artery, *a*, which represents the aorta—the great trunk which, by means of its various branches (none of which are indicated in the diagram), supplies every portion of the body, from the crown of the head to the soles of the feet, with pure arterial blood. From the aorta and its various subdividing branches, the blood passes into the capillaries, *e*, which occur in every part of the system; in these capillaries it undergoes important changes, which may be considered as almost exactly the reverse of those which occur in the pulmonary capillaries; it parts with its oxygen, becomes charged with carbonic acid, and, as it leaves the capillaries, and enters the minute veins formed by their union, presents all the characters of venous blood. The veins gradually unite till they form two large trunks, termed the superior and inferior *venæ cavæ*, which pour their contents into the right auricle—the point from which we started. Only one of these great veins, *d*, is indicated in the diagram. We thus perceive that there is a complete double C.—that there is a lesser C. effected by the blood in its passage from the right to the left heart through the lungs; and that there is a greater C. effected by that fluid in its passage from the left heart through the system generally to the right heart.

From the above simple ideal scheme, we proceed to the consideration of the more complicated arrangements by which the C. is actually effected in man and the higher animals.

The heart is situated in very nearly the center of the cavity of the chest or *thorax*, as it is termed in anatomy, between the lungs, behind the breast-bone, or *sternum*, in front of the vertebral column, and above the diaphragm, on which it obliquely rests. Its form is somewhat conical, the lower end tapering almost to a point, and directed rather forwards and to the left. This lower portion alone is movable, and, at each contraction of the heart, it is tilted forwards, and strikes against the walls of the chest between, in man, the fifth and sixth ribs, or a little below the left nipple. All the large vessels connected with the heart—the *venæ cavæ*, the pulmonary artery, and the aorta—arise from its base (see fig. 2), and serve, from their attachment to the neighboring parts, to keep that portion of it fixed. Indeed, these vessels may be regarded as suspending the heart in the cavity, which is lined by a smooth serous membrane, which, near the top, is reflected downwards over the roots of the great vessels, and covers the whole of the outer surface of the heart. These two smooth serous surfaces—one lining the cavity, the other investing the heart—are kept moist by a fluid which they secrete, and by this arrangement, friction may be regarded as reduced to its minimum. The cavity or sac in which the heart lies is called the pericardium. Like all serous membranes, it is a closed sac, and, as it may not be easy for the non-professional reader to understand the relative position of the heart, which is at the same time surrounded by and external to this membrane, we may observe that the head in an old-fashioned double night-cap—which is a closed bag—is in much the same position as the heart in the pericardium; it is inside the night-cap, but not in the cavity which intervenes between its two layers.

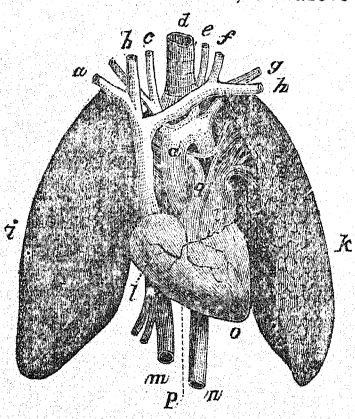

FIG. 2.—THE LUNGS, HEART, AND PRINCIPAL BLOOD-VESSELS IN MAN.

a, *h*, veins from the right and left arms; *b*, *f*, right and left jugular veins, returning the blood from the head and neck—these four veins unite to form a single trunk, the *vena cava superior*, which enters the right auricle, *l*; *c*, *e*, the right and left carotid arteries, the latter rising directly from the arch of the aorta, *a'*, the former from a short trunk called the *arteria innominata*; *g*, the left subclavian artery, rising directly from the aorta, while the right subclavian springs from the *arteria innominata*; *d*, the trachea or windpipe; *i*, *k*, the right and left lungs; *l*, *l'*, the right and left auricles; *p*, the right ventricle; *o*, the apex of ventricle; *m*, the inferior or ascending *vena cava*; *n*, the descending aorta, emerging from behind the heart; *q*, the pulmonary artery.

The substance of the heart is essentially muscular. The fibers run in different directions, longitudinally and transversely, but most of them obliquely; many pass over the apex from one side of the heart to the other; and all are so involved as to render it very difficult to unravel them. In consequence of this arrangement, the fibers, by their contraction, seem simultaneously to diminish each cavity in all directions, and thus serve most efficiently to drive the blood onwards. The size of the heart has been estimated as about that of the closed fist of the same individual. Its weight, as compared with that of the body, was determined by Dr. Clendinning to be 1:160 in the male, and 1:150 in the female. The same physician carefully examined nearly four hundred hearts of persons

of both sexes, and determined the average weight at about 9 oz. avoirdupois, while Dr. John Reid found the average weight of the male heart to be a little more than 11 ozs., and that of the female heart to be a little above 9 ozs.

In our ideal sketch of the organs of C. (fig. 1), we have indicated the different cavities into which the heart is divided. In fig. 3 there is represented a section of the human heart, which is sufficiently like the reality to give the reader a fair idea of the position of its various parts. The two theoretical hearts, which were nearly in contact in fig. 1, are here fused into a single organ, but the division of the two sides is still as complete, in so far as the functions of the heart are concerned, as in the ideal scheme. We see a strong vertical partition separating the entire heart into two halves, which are very similar to each other. In the accompanying figure (fig. 4), we have a representation of all these valves—the auricles having been removed so as to give a distinct view of the upper surface of the ventricles. The tricuspid and mitral valves, which are entirely closed—the two ventricles contracting simultaneously—are represented by 1 and 3 respectively; while the pulmonary and aortic semilunar volves, which, when closed, always present a concave surface towards the lungs, are indicated by 4 and 5. The walls of the ventricles are much thicker than those of the auricles, and those of the left ventricle are about four times as thick as those of the right; the amount of muscular tissue being, in all these cases, proportional to the work to be done. All details regarding the anatomy of the heart, except such as bear directly upon the C., would be out of place in this article, and we shall, therefore, omit all notice of many structures which present themselves on opening its various cavities. We will merely add, that

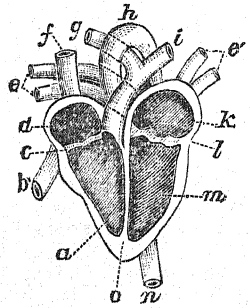

FIG. 3.—THEORETICAL SECTION OF THE HUMAN HEART:

f, *b*, the two *venæ cavæ*, opening into *d*, the right auricle; *c*, the tricuspid valve; *a*, the right ventricle, from which proceeds the pulmonary artery, dividing into branches *g* and *i*, going to the right and left lung respectively; *e*, *e'*, the pulmonary veins (two from either lung), entering into the left auricle, *k*; *l*, the mitral valve; *m*, the left ventricle, from which proceeds the aorta, whose arch is indicated by *h*, and the descending portion by *n*, none of its branches being indicated in this figure; *o*, the partition, or *septum*, between the right and left hearts.

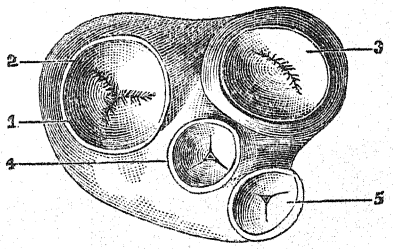

FIG. 4.—VALVES OF THE HEART AND ARTERIES.

Upper surface of the heart, the auricles having been removed. In this figure the heart is turned in such a position that the anterior surface lies lowermost; hence the apparent discrepancy of the *right* auriculo-ventricular orifice lying on the *left* side of the diagram.

1, Right auriculo-ventricular orifice, obliterated by the tricuspid valve; 2, fibrous ring surrounding this orifice; 3, left auriculo-ventricular orifice, surrounded by a ring, and closed by the mitral valve; 4, orifice leading into the aorta from the left ventricle, closed by the semilunar valves; 5, orifice leading into the pulmonary artery from the right ventricle, also provided with three semilunar valves.

the heart receives the arterial blood necessary for its own nutrition from the coronary arteries, two trunks which are given off by the aorta immediately above the semilunar valves; and that this blood having discharged its function, is carried back to the right auricle by the coronary veins; this blood obviously having the shortest possible systemic circulation.

Since all the arterial blood leaves the heart through the aortic opening, in tracing its course to the different parts of the system, we obviously have only to follow the aorta to its final branches. Referring to the article AORTA, where the principal branches of that great organ are indicated, it is sufficient, without further anatomical details, to say that the final ramifications of the arteries distribute the arterial blood to the capillaries (q.v.), which pervade every part of the body.

The *veins*, like the arteries, are found in nearly every tissue; they commence by minute plexuses (an anatomical term for a network-like arrangement), which communicate with the capillaries. Branches from these plexuses uniting together, form small venous trunks, which, by joining, increase in size as they pass onward towards the heart. If we except certain venous structures (called *sinuses*) occurring in the interior of the skull, we may divide the veins into two sets—the *superficial* or *cutaneous*, and the *deep* veins.

The deep veins accompany the arteries, and are usually inclosed in the same sheath of cellular tissue with them. In the case of the smaller arteries, they generally exist in pairs, one on each side the artery, and are called *venæ comites*, while the larger arteries have usually only one accompanying vein.

The superficial veins occur immediately beneath the integument; they not only return the blood from the skin and adjacent structures, but communicate with the deep veins.

All the veins finally unite into two large trunks, termed the *superior* and *inferior vena cava*, which open into the right auricle of the heart: the superior vena cava being formed by the union of the veins which return the blood from the head and neck (the jugulars) with those which convey it from the arms (the subclavians), as shown in fig. 2; while the inferior vena cava (also shown in the same figure) receives the blood from the lower extremities, the trunk, and the abdominal and pelvic viscera.

We must refer to the article VEIN for the structure of the walls of this part of the circulating system. There is only one point that imperatively requires notice here—viz., that while the arterial system presents no valves, except at the points where the two great trunks leave the heart, the veins contain a great number of valves, which are formed by a doubling of their lining membrane, and resemble pocket-like folds or pouches, which allow the blood free passage towards the heart, but prevent its reflux.

There is one part of the venous C. which, from its great importance, requires special notice—viz., that of the venous blood of the spleen, pancreas, stomach, and intestinal canal. The blood supplied to these organs by the cœliac axis and the two mesenteric arteries is not returned directly to the vena cava, and thence to the heart, as occurs in other parts of the system. The veins of these organs unite together into one large vessel, called the *vena portæ*, which, entering the liver, branches out again like an artery, and finally subdivides into a capillary network that permeates the whole of its mass. It is from the venous blood, as it traverses these capillaries, that the bile is secreted. This portal blood, together with the blood of the hepatic artery, after it has become venous, is finally carried off by the hepatic veins (usually three in number), which open into the inferior vena cava.* Thus the blood which flows through the portal vein passes through two sets of capillaries, between the period of its leaving the aorta and entering the vena cava.

Our knowledge of the true course of the C.—viz., that the blood propelled from the left side of the heart, after traversing the arteries, returned by the veins to the right side of the heart; and the blood of the right side, passing through the pulmonary artery, traversed the lungs, and returned by the pulmonary veins to the left auricle—is of comparatively recent date. Harvey's celebrated work, *Exercitatio de Motu Cordis et Sanguinis*, was not published till 1628, although there is good reason to believe that it was written nine or ten years previously. Before the appearance of this celebrated work, which marks an epoch in physiological science, the views that were held on this subject were so vague that it is unnecessary for us to enter into any notice of them. (The reader who takes an interest in this point is referred to Dr. Willis's *Life of Harvey*, prefixed to his translation of Harvey's works, for the Sydenham society.) In one point, Harvey's proof of the course taken by the blood was defective; the microscope had not then revealed the existence of the capillaries, and he was consequently altogether at fault as to the mode by which the blood passed from the arteries to the veins. By a strange coincidence, Malpighi, who discovered the corpuscles by which the motion of the blood in the capillaries can be traced, was born in the course of the very year (1628) in which Harvey's work was published.

The double C. which we have described, is the course performed by the blood from the time of birth during the whole period of life. The C. of the blood, however, begins before birth—indeed, at a very early period of intra-uterine or fetal existence; and the circumstance that before birth the lungs do not act as organs of respiration, induces a very important modification in the course of the blood in fetal life, which will be described under FETUS.

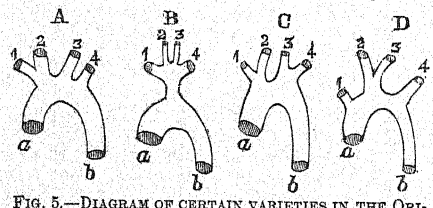

FIG. 5.—DIAGRAM OF CERTAIN VARIETIES IN THE ORIGIN OF THE MAIN TRUNKS FROM THE ARCH OF THE AORTA:

A, Man; B, the Ruminants; C, Dolphin and Bats; D, the Elephant. 1, the right subclavian; 2, right carotid; 3, left carotid; 4, left subclavian; *a*, ascending aorta; *b*, descending aorta.

We now leave for the present the C. in man, and proceed to notice some of the leading peculiarities of the C. in other animals. In the warm-blooded animals—mammals and birds—the course of the blood is *essentially* the same as in man, for in all these animals the heart, like the adult human heart, possesses four distinct cavities. In form, however, it presents certain peculiarities in some of the mammalia. It is generally more rounded and less elongated than in man. In the cetacea, it is very broad and flat; and in at least one genus, the dugong, the right and left ventricles are separated by a deep fissure. In some herbivorous mammals, as in the ox, sheep, goat, etc., a cruciform ossification, called the bone of the heart, is found in the septum between the ventri-

* In fishes, not only the blood of the intestines, but that of the posterior part of the body, enters this portal system, which is distributed in this class of animals both to the kidneys and to the liver.

cles. In the ornithorhynchus, or duck-billed platypus, the heart, in some respects, resembles that of birds. We likewise find certain varieties in the distribution of the blood-vessels. Thus, while in man the subclavian and carotid arteries arise on the right side from a short common trunk given off by the aorta, and on the left side arise directly from the aorta, we find several varieties of this arrangement in the mammalia. In the horse and the ruminants, the aorta divides at once at its origin into an anterior trunk, which gives off the carotid and subclavian arteries of both sides, and a posterior trunk for the thoracic and abdominal aorta. In the dolphin, and in some—if not all—of the bats, two short trunks (*arteriæ innominatæ*) arise, and give off each a carotid and subclavian on either side. In the elephant, both carotids are given off from a single common trunk, situated midway between the two subclavians. All these, and other varieties which might be noticed, are occasionally found in man; and it may be laid down as a general rule, that when any abnormal arterial distribution is detected in the human subject, it represents the normal type in some lower mammal.

A very remarkable peculiarity in the distribution of the vascular system (both arteries and veins) is exhibited by the cetacea and other diving animals, in which the respiration, and consequently the arterialization of the blood, is temporarily stopped. Various arteries of the trunk here assume a ramified and convoluted form, so as to constitute reservoirs capable of holding a large quantity of pure blood; while the venous trunks exhibit similar dilatations, capable of receiving and retaining for a considerable time the impure blood which has circulated through the system, and of thus preventing the right heart from being overcharged with venous blood during the temporary suspension of respiration. By means of these arterial reservoirs, the cetacea can support life under water for a quarter of an hour, or even longer.

Another peculiarity deserving of notice is, that occasionally a large artery will divide into a great number of smaller vessels, which again reunite to form a single trunk. An arrangement of this kind is known as a *rete mirabile*, and a good example of it occurs within the skull in long-necked grazing animals, the object being to check too strong a current of blood to the brain.

In birds, the heart is usually of a very large size, as compared with the bulk of the body. The trunk of the aorta is extremely short, and divides into three main branches, the central one forming the descending aorta, while the two lateral ones give off the carotid and subclavian arteries on either side. The branches of the latter give an abundant supply of blood to the powerful thoracic muscles by which the wings are moved.

In the class of reptiles, there is not a complete double C., a mixture of arterial and venous blood being sent both to the lungs and to the general system. In fig. 6, the general nature of the C. in this class is typically represented. The heart consists of two auricles and one ventricle. The impure blood which has circulated through the system is conveyed by the vena cava into the right auricle, from whence it passes into the common ventricle. At the same time, blood which has been aërated in the lungs is poured into it from the left auricle; hence the ventricle contains an admixture of venous and arterial blood. As both a pulmonary artery and an aorta are given off by the ventricle, the latter by its contractions simultaneously drives one portion of its contents to the lungs, and another to the general system. In this way, a semi-oxygenated blood is transmitted to the various parts of the body, the only pure blood being that which is contained in the left auricle and in the veins opening into it.

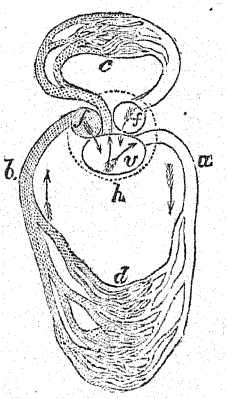

Fig. 6.—Circulation in Reptiles: *h*, heart, inclosed in pericardium; *f*, *f'*, right and left auricles; *v*, single ventricle; *a*, aorta; *b*, vena cava; *c* smaller circulation; *d*, greater circulation.

Although the above may be regarded as the *general* type of the circulating apparatus in reptiles, yet there are many modifications of it (into which we have not space to enter), which connect it on the one hand (in the case of the *perennibranchiate amphibia*, such as the axolotl, proteus, etc.) with that of fishes, and on the other hand (when there is a more or less perfect separation of the ventricular cavity, as in the crocodiles) with that of birds and mammals.

In the class of fishes, the circulating apparatus is far simpler than in reptiles. The heart possesses only two cavities, an auricle and a ventricle, and is traversed solely by venous blood; hence it is analogous to the right side of the mammalian heart. Venous blood is brought by veins, which correspond with our *venæ cavæ*, from all parts of the system, and enters the auricle (see fig. 7); from the auricle, the blood passes into the ventricle, which is of great muscular strength; and the ventricle propels its contents through a vessel which corresponds with our pulmonary artery, and which dividing on either side into four or five branches, goes to the gills, in the capillaries of which it becomes oxygenated, by means of the air that is diffused through the water. From the filaments and fringe-like structures of the gills, it is at length collected into a large trunk, commonly called the dorsal vessel, but analogous to the aorta of mammals and birds, in so much as it supplies the whole body with arterialized blood. After passing through the systematic capillaries, the blood returns in a venous condition to the heart.

and the above process is repeated. Although the heart is simpler than in reptiles, the C. is in one sense of a higher character, in so far as pure arterial (not mixed) blood is here conveyed to all parts of the system; hence, probably, the far greater muscular energy of fishes may be explained.

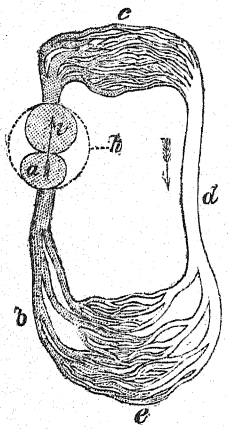

FIG. 7.—CIRCULATION IN FISHES:
h, heart, inclosed in pericardium; *a*, the auricle; *v*, the ventricle; *c*, the capillary circulation in the gills; *d*, the dorsal artery; *e*, the systemic capillaries; *b*, the veins.

We can only allude very briefly to the C. in the invertebrate animals.

In the mollusca, we find hearts of varying complexity,* usually with one or two auricles, and one ventricle; but in all cases, the auricle or auricles receive aërated blood from the respiratory organs and pass it to the strongly muscular ventricle, which propels it over the body. The heart is therefore a *systemic* heart. There seem to be no capillaries in these animals, excepting in the respiratory organs; the blood leaving the open ends of the arteries, passes into the interstices (*lacunæ*) of the parenchyma of the body, from whence it is taken up by the open mouths of the venous radicles; hence this kind of C. is called lacunary.

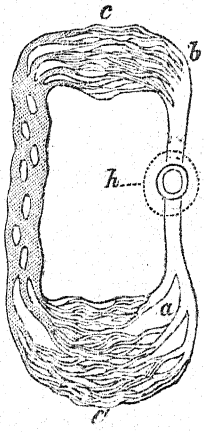

FIG. 8.—CIRCULATION IN THE CRUSTACEANS:
h, the heart and pericardium; *a*, the arteries; *c'*, the systemic capillaries; *c*, the branchial or respiratory capillaries; *b*, the branchio-cardiac vessels.

In the crustacea, the form of the heart and the number of its orifices presents several modifications; the following is, however, the *typical* mode of C. of these animals. The heart, which is here a single cavity, is sometimes round, and sometimes long and tubular, and is the point of departure of the arterial system, which consists of trunks emerging in various directions. The blood returning from the arteries does not enter into distinct veins, but into irregular excavations in the tissues, which are termed venous sinuses; from these venous sinuses it passes to the gills, from whence it is returned to the heart in an aërated state by the branchio-cardiac canals; so that here, as in the mollusca, the heart is systemic.

It is unnecessary for us to notice the comparatively imperfect C. in insects and animals lower in the scale than those we have already considered.

We now approach the last part of the subject—the physiology of the circulation.

We shall consider—1. The flow of blood through the heart; 2. The phenomena of the arterial C.; 3. The phenomena of the capillary C.; and, 4. The phenomena of the venous circulation.

1. Direct observation and experiment clearly show, that the muscular contraction of the heart is the principal source of the power by which the blood is propelled in its course. This action of the heart may be observed by opening the chest of a living animal, or, better still, of an animal deprived of sensation and motion by poison, and in which artificial respiration is kept up. It is then seen to consist of two motions—first, a contraction or systole of the auricles, and second, a corresponding contraction of the ventricles. The contraction of the auricle immediately precedes that of the ventricle, and the systole of each cavity is directly followed by its diastole or relaxation; there is then a brief period of repose, the heart exhibiting little or no motion. At the moment of the systole of the ventricles, the apex of the heart is tilted forwards, causing a pulsation against the ribs that can be felt externally.

The force exerted by the left ventricle has been so very variously estimated, that we must regard this point as still unsettled. The number of contractions of the heart of an adult in a minute is about 70 or 75; it is, however, liable to great variations, which will be noticed in the article PULSE. The sounds accompanying the heart's action, which may be readily heard by applying the ear either directly or through the medium of the stethoscope to the cardiac region, are discussed in the article HEART, SOUNDS OF THE.

2. The arteries exercise a vast influence on the movement of the blood through them, in virtue of two properties which they possess—viz., elasticity and contractility. These two endowments are not equally and uniformly possessed by the whole arterial system—elasticity (the property by which the interrupted or discontinuous force of the heart is made equable and continuous) existing chiefly in the larger trunks; while contractility—which is more required for regulating the flow of blood to particular parts—is most

* In some of the ascidians and in salpa, the following remarkable phenomenon occurs: The heart, which is extremely simple, and of course without valves, at definite intervals (of about twenty minutes) reverses the direction of its current. Before the heart changes the direction of its contractions, it remains still for a short time, and the blood-currents in the body are thus slackened in their course before they receive an impulse in the opposite direction. The vessels entering and leaving the heart thus act alternately as an aorta and as a vena cava.

marked in the smaller vessels. The rate of movement of the blood through the arteries in man can only be roughly calculated from experiments on animals. Volkmann finds that in the carotids of mammals, the average velocity of the blood-stream is about 12 in. per second; he has likewise ascertained that the velocity is greater in arteries lying near than in those at a distance from the heart, that it is not increased by an augmentation in the number of pulsations, but that it is greatly augmented by an increase in the volume of the blood, and lessened by its diminution.

3. It has long been a debated point, whether the capillary C. is influenced by any other agency than the contractility of the heart and arteries. Harvey believed that the action of the heart alone was sufficient to send the blood through the whole circuit, and in recent times his view has been supported by J. Müller and other eminent physiologists. On the other hand, prof. Draper of New York holds the opposite extreme view, asserting that "it is now on all hands conceded that the heart discharges a very subsidiary duty." We believe that Bichat was the first to maintain the opinion, that the capillaries are organs of propulsion, and are alone concerned in returning the blood to the heart through the veins. Although Bichat attributed too great power to the capillaries, there cannot be a doubt that the movement of the blood through these vessels is not solely due to the heart; in short, that there is what may be termed a capillary power. The following are a few of the facts proving this to be the case: 1. On watching the C. in the web of a frog's foot, it is at first seen to go on with perfect regularity. After a time, however, various changes are observed, which cannot be attributed to the heart, such as alterations in the size of some capillaries, and in the velocities of the currents passing through them, and occasionally even a reversal in the direction of some of the lesser currents. 2. In cold-blooded animals, the movement of the blood in the capillaries continues long after the excision of the heart. 3. Actual processes of secretion not unfrequently continue after death; sweat, for instance, may be exuded from the skin; and other secretions may be formed by their respective glands, which could not take place if the capillary C. had stopped. 4. Cases occasionally occur in which a fetus without a heart is produced, and yet in these cases most of the organs are well developed.

What the nature of this capillary power is, is not clearly known. Prof. Draper and others have endeavored to explain it on the principles of capillary attraction. There is no satisfactory evidence that the capillaries possess true contractility, for, although their diameter is subject to great variations, this may be due simply to the elasticity of their walls. If we could only establish their contractility, the difficulty would be removed.

The rate of movement of the blood through the capillaries is about 1.2 in. per minute in the systemic capillaries of the frog. In the warm-blooded animals it is probably more rapid. From Volkmann's observations, the rate in the dog is about 1.8 in. per minute.

4. It is usually estimated that the venous system contains from two to three times as much blood as the arterial. The latter is probably the more correct ratio, and as the rapidity of blood in the two systems seems to bear an inverse ratio to their respective capacities, the venous blood will move with only one third of the velocity of arterial blood. We have already noticed the occurrence of valves in the venous circulation. Their object is evidently to prevent the reflux of blood; hence they are of important use in the maintenance of this part of the circulation. They are most abundant where there is much muscular movement. The movement of blood through the veins is undoubtedly mainly due to the *vis a tergo* resulting from the contraction of the heart and arteries. This is much assisted in many parts of the system by the constantly recurring pressure of the adjacent muscles upon their trunks. The movement of inspiration, by causing a comparative vacuum in the chest, has been supposed by some physiologists to assist the flow of venous blood to the heart, and a similar influence has been ascribed to an assumed suction-power of the heart. The contractility of the veins in man is too slight to produce any marked effect on the propulsion of the current. From the investigations of prof. Wharton Jones "on the rhythmical contractility of the veins of the bat's wing," we may infer that, in many of the lower animals, it is probably a more efficient power. In connection with this article, consult Artery, Capillaries, Pulse, and Vein.

CIRCULATION OF SAP in plants—its ascent from the root to the leaves and bark, and its partial descent after the elaboration which it undergoes in these organs. The sap drawn from the ground by the roots (see Osmose) ascends in exogenous plants, which have hitherto been principally the subjects of examination, through the more recent parts of the woody tissue, and especially through the alburnum. The descent of the sap takes place chiefly through the liber or inner bark. It appears certain also that, on its return to the root, only a small portion is excreted, and that the greater part ascends again, readapted to the use of the plant by the excretion which has taken place. Much of the sap which is taken up by the roots is, however, thrown off in perspiration by the bark and leaves. The sap is also latterly diffused through the cellular tissue of plants, and very interesting observations have been made by Schultz and others on peculiar movements of the elaborated or descending sap (*latex*). Many physiologists

dislike the term *circulation* applied to sap, as suggesting a closer analogy than really exists to the circulation of the blood in animals. See PLANT, LEAVES, and SAP.

CIRCUMCELLIO'NES, fanatical Donatists of the 4th c., who got their name from their habits of wandering. They rambled over the country, plundering, burning houses, and murdering those who made resistance, saying that by such means they sought the crown of martyrdom. They styled themselves "Milites Christi Agnostici," and called their chiefs the leaders of the sons of the Holy One. Constantine treated them with forbearance, but under his successor they were put under restriction by the civil power.

CIRCUMCISION (Lat. a cutting around), the cutting off the foreskin (*præputium*), a rite widely diffused among ancient and modern nations. The prevalent idea among Christians was (and perhaps still is), that the rite originated with Abraham, who (as we read in Gen. xvii. 9–14) was commanded by God to circumcise himself and his whole household, and to transmit the custom to his descendants. But, as Jahn (*Biblische Archäologie*, Vienna, 1797–1800) acutely observes, this is inconsistent with the very terms in which the command is expressed, these terms presupposing a knowledge of the rite on the part of Abraham. That it existed previously to the time of the patriarch, however, seems to be indisputable. The researches of modern scholars prove that the Egyptians, for instance, were in the habit of circumcising long before Abraham was born. Rawlinson, in a note to his version of Herodotus, remarks that "circumcision was already common in Egypt at least as early as the fourth dynasty of kings, and probably earlier, long before the birth of Abraham, or 1996 B.C." The testimony borne by the monuments of Upper and Lower Egypt (consult sir Gardiner Wilkinson's *Manners and Customs of the Ancient Egyptians*) is to the same effect, and apparently conclusive. Another argument which has been adduced against its Abrahamic origin, is the fact of its being so extensively practiced. At the present day, it may be traced almost in an unbroken line from China to the cape of Good Hope. It is also a usage in many of the South Sea islands, and the followers of Columbus were much astonished to find it existing in the West Indies, and in Mexico. Recently, too, it has been ascertained to have been long practiced by several tribes in South America. Such being the case, many scholars hold it impossible to suppose that the origin of so universal a rite can be traced to a single Semitic nation, more especially when that nation was peculiarly averse to intercourse with other nations, and in other respects exercised no overt influence on their customs. Whether, as Jahn supposes, Abraham obtained his knowledge of C. from the Egyptians, we cannot determine. It would appear, however, that the Canaanites, among whom he came to reside, were not circumcised, for we read of the prince of Shechem and his people undergoing the operation, that the former might obtain the hand of Dinah, daughter of Jacob; and the institution of it in the family of Abraham was probably sufficient to mark off that family from the surrounding tribes. In the case of Abraham and his descendants, the rite acquired a religious significance. It was ordained to be the token or seal of the everlasting covenant between God and his people. Such is the view of St. Paul, who looked upon the C. of the foreskin as symbolical of the C. of the heart; and that along with all that was merely Judaistic and material, it was abrogated by the more spiritual teaching of Christ.

The time for C. among the Jews is the 8th day after the birth of the child; among the Arabians, the 13th year, in remembrance, it is said, of their ancestor Ishmael; among the Kaffirs, at a still later period, marking, in fact, the transition from youth to manhood; and, indeed, each nation seems to have selected the time most agreeable to its own notions of what is prudent or becoming. The Abyssinians are the only people professing Christianity among whom C. is practiced. The C. of females, or what is equivalent to such, is not unknown among various African nations. For fuller information in regard to C., consult Sonnini's *Travels in Egypt*, sir John Marsham's *Chronicus Canon Ægyptiacus*, and Winer's *Biblisches Realwörterbuch*.

CIRCUMFERENCE, or PERIPH'ERY, the curve which incloses a plane figure: thus, we speak of the circumference of a circle, or of an ellipse; but in figures bounded by straight lines, as the triangle, square, and polygon, the term *perimeter* is employed to designate the whole bounding lines taken together.

CIRCUMNAVIGATION, the term usually applied to the act of sailing round the world, its literal meaning being simply a sailing round. The C. of the globe was at one time considered a great feat, but it is now regarded as one of the most commonplace affairs in a sailor's experience. The first to circumnavigate the globe was Magalhaens (q.v.), or Magellan, a Portuguese, in 1519; eighteen years afterwards it was accomplished by a Spaniard; and in 1577 by the illustrious Englishman, Drake. The most celebrated of circumnavigators, however, was capt. James Cook, who, between 1768 and 1779, made three voyages round the world.

CIRCUMPO'LAR STARS, those stars which, in the apparent daily revolution of the sky, do not pass below the horizon of the observer, or, in familiar language, do not set. It will be remembered that the apparent daily motion of the stars is the reflex of the actual rotation of the earth upon an axis which passes through the center of the earth and a point in the sky, near the north, or polar star; that the lines in which the stars seem to move, called lines of daily motion, are the circumferences of circles that are perpendicular to this axis. Hence, if an observer is at the equator, the axis lies in

the observer's horizon, the circles of daily motion are all perpendicular to the horizon, and all stars seem to rise and set. If the observer is at a distance from the equator, for example 10° n., the northern end of the celestial axis is raised 10° above the horizon, and any star which is within 10° of the n. pole of the sky will not pass below the horizon in its apparent motion about the pole. The largest circle of the sky which may be drawn about the pole without passing below the horizon, is called the circle of perpetual apparition. A similar circle drawn about the s. pole, without coming above the horizon, is called the circle of perpetual occultation, and the stars within that circle are never visible to the observer in consideration. But, to an observer in the southern hemisphere, having a s. latitude equal to the n. latitude of the first supposed observer, the terms will be transposed; the circle about the s. pole is to him a circle of perpetual apparition, and the stars within it, circumpolar stars; the corresponding circle about the n. pole is the circle of perpetual occultation, the stars within which never appear above his horizon. The radii of the circles of perpetual apparition and occultation are equal, and equal to the latitude of the observer, and to the altitude of the nearest pole. In the northern states the most conspicuous circumpolar constellations are the great and little bear—the latter containing the pole star—and Cassiopeia. In the southern sky the most brilliant constellation is the southern cross.

CIRCUMSTANTIAL EVIDENCE. See EVIDENCE.

CIRCUMVALLATION, in fortification, is a series of works surrounding a place when under siege; not to serve offensively against the place, but to defend the siege-army from an attack from without. It usually consists of a chain of redoubts, either isolated or connected by a line of parapet. Such lines were much used in the sieges of the ancient and middle ages; but in modern times they are not so necessary, because the use of artillery lessens the duration of a siege, and also because the besiegers have generally a corps of observation in the open field, ready to repel any force of the enemy about to succor the besieged. A remarkable example of C. was that at Sebastopol, where, while a circuit of batteries fired upon the town, an outer circuit of redoubts and lines kept off the Russians who were in the open field; but the necessity for this arose out of the smallness of the besieging force compared with that of the besieged. The narrow escape of the allies from utter overthrow at Inkermann, showed the necessity for this external defense. For the relation which C. bears to COUNTERVALLATION, see that article.

CIRCUMVEN'TION. See FRAUD.

CIRCUS. See HARRIER.

CIRCUS, THE, of ancient Rome, was a large oblong building adapted for chariot-races and horse-races, and used also for the exhibition of athletic exercises, mock-contests, and conflicts of wild beasts. The circensian games were alleged by tradition to have originated in the time of Romulus, when they were dedicated to Consus or Neptune, and called *Consualia*. After the first war undertaken by Tarquinius Priscus, in which he captured the Latin city of Apiolæ, his victory was celebrated by games. A space was marked out for a C., and the senators and knights were allowed to erect scaffoldings round it for themselves. The games continued to be held annually, and a permanent edifice was soon afterwards constructed. This was distinguished, subsequent to the erection of the Flaminian and other large circi, as the circus maximus. It must have been altered and enlarged at various times. According to different computations, it was capable of holding 150,000, 260,000, or 385,000 persons. Its extent also has been variously estimated. In the time of Julius Cæsar, it was three stadia, or 1875 ft. long, and one stadium, or 625 ft. wide, while the depth of the buildings surrounding the open space was half a stadium, or about 312 feet. All the circi in Rome, of which there were a considerable number, are now completely destroyed; but a small C. on the Appian way, about 2 m. from Rome, known as the circus of Caracalla, is still in a state of preservation. Its construction is believed to have differed very little from that of similar buildings.

Along the sides and at the curved end were ascending ranges of stone seats for the spectators. At the other end, were the *carceres*, or stalls, which were covered, and furnished with gates, and in which the horses and chariots remained until, on a given signal, the gates were simultaneously flung open. In the center is the *spina*, a long and broad wall round which the charioteers drove, terminating at both ends at the *metæ*, or goals—three cones of carved wood which marked the turnings of the course. At each extremity of the *carceres* is a stone tower. From its gates and castellated appearance, the whole of this side received the name of *oppidum*, a town. Over the *carceres* were seats for the president of the games, the consuls, or other distinguished persons. There were four entrances, of which the most important were the *porta pompæ*, and the *porta triumphalis*. The games were inaugurated by a procession from the capitol, in which those bearing the images of the gods went first, and were followed by the performers in the games, the consuls, and others. This procession entered through the *porta pompæ*, while the *porta triumphalis* was that by which the victors left the circus.

The *spina*, an object conspicuous from its situation, was in general highly decorated by such objects as statues, small temples, altars, etc. In the *spina* of the Circus Maximus, two very large obelisks were erected by Augustus and Constantius. This C. was

also distinguished by six towers, and by a canal or *euripus*, formed by Julius Cæsar, to protect the spectators more effectually during the conflicts of wild beasts.

The C. was especially adapted for races, an amusement of which the Romans were passionately fond. The length of a race was seven circuits round the *spina*, and 25 races were run in each day. The number of chariots was usually four. The charioteers adopted different colors, representing the four seasons. Bets and party-spirit ran high, and the victor received a substantial pecuniary reward at the end of the race. The athletic exercises, such as boxing and wrestling, which sometimes terminated fatally, were probably exhibited in the large open space between the *carceres* and the *spina*. The *ludus Trojæ* was a mock-conflict between young men on horseback. A regular battle was sometimes represented (*pugna equestris et pedestris*). By the formation of canals and the introduction of vessels, a *naumachia*, or sea-fight, was occasionally exhibited; but, under the empire, this species of exhibition, as well as the *venatio*, was gradually transferred to the amphitheater (q.v.). In providing for the *venatio*, or hunting of wild beasts, vast sums of money were expended. Animals were procured from every available part of the Roman empire, including Africa and Asia. The exhibition not only afforded an opportunity for the display of private munificence or ostentation, but attained the importance of a political engine, which none who aspired to popularity ventured to overlook. When Pompey opened his new theater, he is said to have given public exhibitions in the C. for five days, during which 500 lions and 20 elephants were destroyed.

In modern times, the C. stands but as the shadow of a name. It is about the same size as the modern theater, and is employed principally for the exhibition of feats of horsemanship and for acrobatic displays.

CI'RENCES'TER, or CICESTER, a parliamentary borough in Gloucestershire, on the Churn, an upper branch of the Thames, and on the Thames and Severn canal, 17 m. s.e. of Gloucester. It has four chief streets, and the appearance of opulence, though it has but little trade. A complete agricultural college was founded here in 1846 on a farm of 600 acres. Pop. '71, 7,681. C. returns one member of parliament. C. was the Roman *Corinium-Ceaster*, at the junction of five Roman roads, and has traces of ancient walls 2 m. in circuit. Roman relics have been found here, as coins, urns, baths. Canute held a council here in 1020 to expel Ethelwolf. Rupert stormed C. in 1642 and 1643, and it was afterwards given up to Essex.

CIRIL'LO, DOMENICO, 1734–99; a Neapolitan naturalist who accompanied lady Walpole to France and England, and became a fellow of the royal society, enjoying there and on the continent the friendship of Buffon, Diderot, D'Alembert, and other learned men. When the French established government in Naples in 1799, C. was chosen a representative, and became president of the legislative commission. After the re-establishment of the royal government, he was sentenced to death, but was offered his life if he would ask for mercy. This he refused to do, and suffered death. He wrote works on botany and entomology.

CIRRHOP'ODA, or CIRRIP'EDA (Gr. or Lat. cirrhus-footed), the animals which formed the genus *lepas* of Linnæus, ranked by him among the multivalve *testacea*, and by subsequent naturalists very generally regarded as an order of mollusks, until, in consequence of recent discoveries, a place has been assigned them among the *articulata*, either as a distinct class of that great division of the animal kingdom, or as a sub-class of *crustacea*. Barnacles (q.v.) and *balani* or acorn-shells (see BALANUS) are the most familiar examples of C.; but many species are now known, all exhibiting much general similarity to these, all marine, and all in their mature state permanently attached to objects of various kinds, as rocks, sea-weeds, shells, etc. Some are found imbedded in corals, others in the thick skin of whales, some in the flesh of sharks. They are distributed over the whole world; the species, however, are not numerous anywhere; those species which adhere to fixed bodies are in general much more limited in their geographic range than those which attach themselves to floating objects or to vertebrate animals. They are generally divided into two orders, *pedunculated* and *sessile*, those of the former order being supported on a flexible stalk, which is wanting in the latter. Barnacles are pedunculated C., and *balani* are sessile.

The resemblance of C. to mollusks consists chiefly in their external appearance. In the more important parts of their organization, however, the C. resemble crustaceans rather than mollusks. The gills, when these exist, occupy the same relative position as in crustaceans; but the aëration of the blood is supposed to be also effected in the *cirrhi*, as the limbs or organs have been generally called, of which there are six pair on each side, and which may be described as long tapering arms, each composed of many joints and *ciliated* or fringed with stiff hairs. The *cirrhi* nearest the mouth are shortest, and all of them together form a sort of net for the capture of minute animals, being incessantly thrown out by the cirrhopod from a lateral opening of its sac, and drawn in again in such a manner as to convey any prey which they may have caught to the mouth. Almost all the C. are hermaphrodite; but in a few genera the sexes are distinct, and these exhibit an anomaly of a very remarkable kind, the males being not only very small in comparison with the females, and more short-lived, but, in their mature state, *parasitic* on the females, or attached to them as they are to other objects; whilst in some the still more remarkable anomaly appears of what have been called *complemental* males, attached

in this way to hermaphrodites. The eggs of C. are hatched before being finally set free from the body of the parent. The young possess the power of locomotion, swimming freely in the water, and are furnished with eyes, which disappear after they have permanently fixed themselves, by instinctive choice, in situations adapted to their kind. They have also shells, quite different from those of their mature state. The shelly coverings of the C. are all formed according to a certain type, but with many variations, and they differ extremely in the number of pieces or valves of which they consist, some, as the common barnacles, having only five valves, and others having additional small pieces arranged in whorls, and exceeding 100 in number. In most of the C., the shelly covering is very complete; in some, it is almost rudimentary.

The most important discoveries concerning the structure and metamorphoses of the C., determining their place in the animal kingdom, were made by Mr. J. V. Thompson. For the most extended examination of species, and for an admirable monograph, published by the Ray society, the scientific world is indebted to Mr. Darwin.

CIR'RHUS, CIR'RUS (Lat. a curl, or lock of hair), or TENDRIL, in botany, a leaf altered into a slender spiral, which, by twisting around such objects as it comes in contact with, attaches the plant to them, and enables it to climb, when otherwise, through the weakness of its stem, it must have been prostrate. There are many varieties of C., as it is merely an elongation of the midrib of a pinnate leaf—an altered terminal leaflet, or becomes compound by the alteration of several leaflets, or occupies altogether the place of a simple or compound leaf, and is accordingly either simple or branching. Examples of different kinds may be seen in the pea, vetch, vine, passion-flower, etc.—The term C. is also employed in zoology, to designate any curled filament, and has been applied, but not quite aptly, to the curiously modified feet of the *cirrhopoda.*

CIR'RUS. See CLOUDS.

CIRTA, an ancient city of Numidia, Africa, in the country of the Massyli, regarded as the strongest position in Numidia. It was the center of all the Roman military roads. It was restored by Constantine, and the modern town now bears his name.

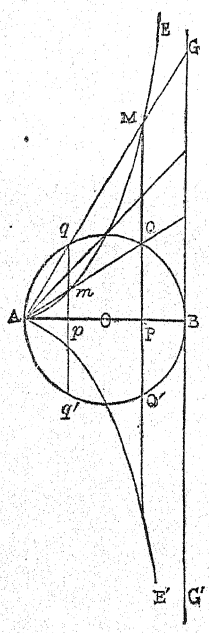
CIS, a Latin preposition meaning, "on this side," which is often prefixed to names of rivers and mountains to form adjectives; Cisalpine, Cispadane, "on this side of the Alps," "of the Po." As most of these words are of Roman origin, Rome is considered the point of departure.

CISAL'PINE REPUBLIC. After the battle of Lodi, in May, 1796, gen. Bonaparte proceeded to organize two states—one on the s. of the Po, the Cispadane republic, and one on the n., the Transpadane. These two, however, were in 1797 united into one under the title of the C. R., which embraced Lombardy, Mantua, Bergamo, Brescia, Cremona, Verona, and Rovigo, the duchy of Modena, the principality of Massa and Carrara, and the three legations of Bologna, Ferrara, and the Romagna. The republic had a territory of more than 16,000 sq.m., and a population of 3½ millions. Milan was the seat of the government or directory, and the place of meeting of the legislative assembly, which was composed of a senate of 80 members, and a great council of 160. The army consisted of 20,000 French troops, paid by the republic. A more intimate connection was formed in 1798 between the new republic and France, by an alliance offensive and defensive, and a treaty of commerce. The republic was dissolved for a time in 1799 by the victories of the Russians and Austrians, but was restored by Bonaparte, after the victory of Marengo, with some modifications of constitution and increase of territory. In 1802, it took the name of the Italian republic, and chose Bonaparte for its president. A deputation from the republic in 1805 conferred on the emperor Napoleon the title of king of Italy; after which it formed the kingdom of Italy till 1814.

CISLEITHANIA, or CISLEITHAN AUSTRIA, a name applied to that portion of the Austro-Hungarian monarchy which is represented in the Reichsrath of Vienna. It has about one half the area and four sevenths of the population of the monarchy, and embraces the crown lands once belonging to the German confederation, Dalmatia, Buckowma, and Galicia.

CIS'PADANE REPUBLIC. See CISALPINE REPUBLIC, *ante.*

CIS'PLATINE REPUBLIC, the name of the republic of Uruguay, 1829–31. It had previously belonged to Brazil and had the name of the Cisplatine province.



CIS'RHENANE REPUBLIC, the name chosen in 1797 for the proposed confederation of the German towns w. of the Rhine. As the whole region was soon afterwards transferred to France, the name never came into use.

CISSAM'PELOS (Gr. ivy-vine), a genus of plants of the natural order *menispermaceæ,* of which some of the species possess valuable medicinal properties; particularly *C. pareira,* a native of the West Indies and warm parts of America, the root of which is known by the names of *pareira brava* and *butua root.* The plant is called velvet leaf in the West Indies, from the peculiar and beautiful appearance of the leaves. It is a climbing shrub, with roundish-triangular leaves, racemes of small yellow flowers, and small hairy scarlet berries. The root appears in commerce in pieces of 2 or 3 ft. long, varying from the thickness of the finger to that of the arm, tough, but so porous that air can be blown from end to end of it. It has a sweetish, afterwards nauseous taste; is used as a tonic

and diuretic, appears to exercise a specific influence over the mucous membrane of the urinary passages, and is administered with advantage in chronic inflammation of the bladder. It was formerly supposed to possess great lithontriptic powers, which it was even hoped would put an end to all necessity for lithotomy. It is supposed that the roots of other plants of the same order are often fraudulently mingled with it; but those of several species of C., both American and East Indian, appear to possess pretty nearly the same properties. An alkaloid, called *cissampelin*, exists in this root, and gives it its properties.

CISSEY, Ernest Louis Octave Courtot de, b. 1812; in 1835, he served under gen. Trezel in Algeria, and in 1854 in the Crimea, rising to brig.gen. after the battle of Inkerman. He also served in the war with Germany. In 1871, he was elected to the national assembly, and the same year he led the second corps against the Paris commune. He was appointed minister of war in 1871, and served, except in the period of the De Broglie cabinet, until 1876, when he resigned.

CIS'SOID OF DI'OCLÉS, a curve first employed by Diocles the mathematician, whose name it bears, for the purpose of solving two celebrated problems in geometry—viz., the trisection of a plane angle, and the construction of two geometrical means between two given straight lines. Let AB (see fig.) be the diameter of any given circle, and PQ, *pq*, any two ordinates at equal distances from the centre O. Then if we draw a straight line through A and either of the points *q*, Q, and produce it till it cuts the other ordinate, produced if necessary, the point of intersection, M, or *m*, will, in its different positions, trace out a curve called a *cissoid*. The circle AB is called the generating circle, and the diameter AB is called the axis of the curve. It is clear from the figure that the cissoid must consist of two infinite symmetrical branches, AE and AE', having a cusp point at A. The straight line GB, tangent at B to the generating circle, is a common asymptote to these branches. Taking A as origin, and AB = *a* and a line at right angle to it, through A, as axes of co-ordinates, the equation to the cissoid is $y^2 = \frac{x^3}{(a-x)}$. The curve may be constructed mechanically. The area of the space included between the two branches and their asymptote, is equal to three times the area of the generating circle. If, instead of a circle, we employed any other curve as the generating curve, the curve generated in the same way as the C. of D., is called *cissoidal*. The word cissoid comes from the Greek *cissos*, ivy, and *eidos*, form.

Cissoid.

CIS'SUS. See Vitaceæ.

CISTER'CIANS, a religious order, taking its name from the parent monastery of Citeaux (Cistercium), near Dijon, which was founded in 1098 by the Benedictine abbot, Robert of Molême. Through the influence chiefly of St. Bernard of Clairvaux, who became a monk of Citeaux in 1113, the order, within little more than a century after its foundation, was in possession of more than 1800 abbeys in France, Germany, England, Ireland, Denmark, Norway, and Sweden. The C. were distinguished from the order of Clugny by their severer rule and stricter poverty, avoiding any splendor in their churches, even gold and silver crosses; by being submissive to the jurisdiction of the bishops, at least till after the death of St. Bernard; by not meddling with the cure of souls; by wearing a white robe with a black scapulary; and by their peculiar form of government, which was introduced by Innocent III., in 1215, into all the monastic orders. In France, the members of this order called themselves Bernardines, in honor of St. Bernard. Among the fraternities emanating from the C., the most remarkable were the Barefooted monks or Feuillans, and the nuns of Port Royal in France, the Recollets or or reformed Cistercian nuns in Spain, and the Trappists. The number of Cistercian abbeys in England, in the reign of Henry VIII., was 75, besides 26 Cistercian nunneries. In Scotland, there were 11 abbeys, and 7 nunneries. Among the English abbeys were Woburn, Tintern, Furness, Fountains, Kirkstall, and Rievaux; among the Scottish, Melrose, Dundrennan, Kinloss, Glenluce, Culross, Deer, Balmerino, and Sweetheart or New Abbey. The chief French abbeys, *les quatre premières filles de Citeaux*, as they were called, were La Ferté, Pontigny, Clairvaux, and Morimond. Riches and indolence brought this powerful order, as well as others, into decay. Even before the reformation, many of their convents had ceased to exist. The French revolution reduced the C. to a few convents in Spain, Poland, Austria, and Saxony.

CISTERN, a tank for holding water. In places where the supply of water is intermittent, or where rain-water is used, every house requires a C. or water-butt. Cisterns are much used for the supply of steam-engine boilers, at railway-stations. They are

variously constructed—many of cast or wrought iron, of deal lined with lead or zinc, or of impervious pavement or slate slabs, in which last two cases the sides and bottom are grooved, and cemented together with white-lead putty, or some other cohesive substance, to prevent leakage; and the sides, if the dimensions be at all large, are frequently bound together by means of wrought-iron rods; but very large C.'s are generally made cylindrical, so that the pressure acting at all points equally from the center, the strain comes longitudinally on the outside, and tie-rods can be dispensed with, which is an advantage, as the holes for the tie-rods are apt to be a cause of leakage. See WATER SUPPLY.

CIS'TUS (Gr.), or ROCK-ROSE, a genus of exogenous plants, which gives its name to the natural order *cistaceæ;* an order allied to *cruciferæ* and *capparideæ*, and containing about 200 known species of shrubs and herbaceous plants, chiefly natives of the s. of Europe and n. of Africa. The flowers have generally five petals, very delicate; the stamens are numerous, the style simple, the fruit a capsule. Many species of this order are more or less resinous; and from the twigs of some species of *cistus*, natives of the s. of Europe and the Levant, particularly *C. Creticus, C. Cyprius,* and *C. ladaniferus*, the resinous substance called *ladanum* is obtained, which is used as a stimulant, chiefly in plasters, but has become obsolete in British medical practice. Many species of *cistus* are much cultivated for the beauty of their flowers, which are red, white, lilac, yellow, or frequently of two colors, and are common in gardens and green-houses. Most of the larger kinds require in Britain some protection in winter. The only plant of the order which extends to Scotland is *helianthemum vulgare*, the yellow flowers of which are a frequent ornament of dry hill-slopes.

CIT'ADEL (from the Italian *cittadillo*, "a little city") is a fort of four or five bastions, in or near a town. A C. serves two purposes: it enables the garrison of a town to keep the inhabitants in subjection; and, in case of a siege, it forms a place of retreat for the defenders, and enables them to hold out after the rest of the town has been captured. A C. must fully command the fortifications of the city, and have a large space round it clear of buildings.

CITATION, the act of calling a party into court to answer to an action, to give evidence, or to perform some other judicial act. Being derived from the civil law, the term C. is known in England chiefly or exclusively in the ecclesiastical courts. But it is in frequent use in the legal systems both of France and Scotland. In Scotland, a C. is done in the court of session by an officer of court, or by a messenger-at-arms (q.v.), under authority either of a summons passing the signet (q.v.), or under a warrant by the court. In inferior courts, no summons, complaint, or decree is now validly served by affixing it to the door of the house, except where the defender has left, and his address is unknown; and no witness is necessary to the service except in poinding, sequestrating, or charging (34 and 35 Vict. c. 42).

Where the party, though amenable to the court, is not resident in Scotland, he must be cited edictally, by a copy of the C. being left at the office of the keeper of edictal citations (see EDICTAL CITATION), by whom lists of such citations are printed and published. Formerly, this C. was effected by a proclamation at the market-cross of Edinburgh, and the pier and shore of Leith.

In criminal cases, the party cannot appear voluntarily in court: he must be cited, and can plead any omission in form, which cannot be obviated even by consent. This form of C. is regulated by 9 Geo. IV. c. 29, commonly called sir William Rae's act. A full and correct copy of the libel, or charge against him, must be served on the panel, or accused, with a list of witnesses, and of the assize, or jury. A notice, intimating the day of compearance, must be marked on the copy of the libel, and subscribed by the officer and a witness. This C. must proceed on a warrant issuing from the court before which the accused is to be tried. It may be executed either by a macer (q.v.), a messenger-at-arms (q.v.), or a sheriff-officer (q.v.) of the county within which the C. is made (11 and 12 Vict. c. 79, s. 6). If the panel can be found personally, the C. must be delivered to him, but if not, it must be left at his dwelling-place with his wife or servants; or if access cannot be obtained, the officer must affix a copy to the principal door of the house (1555, c. 33).

CITATION FOR INTERRUPTING PRESCRIPTION.—Either the positive or negative prescription may be interrupted by citation in an action. See PRESCRIPTION.

CITEAUX, or CISTEAUX, a village in the department of Cote d'Or, France, 12 m. from Dijon. It is celebrated for the great abbey founded in 1098, which became the headquarters of the Cistercian order. The buildings are now occupied as a juvenile reformatory. The place became famous for the wines made under the care of the abbots, the celebrated Clos Vougeot having been raised on lands belonging to the abbey.

CITHAE'RON, MOUNT. See ELATEA.

CITIZEN (Fr. *citoyen*, Lat. *civis*). Aristotle defines a C. to be one to whom belongs the right of taking part both in the deliberative, or legislative, and in the judicial proceedings of the community of which he is a member (*Politics*, iii. 1). A C., therefore, can exist only in a free state. Between a C. and a subject there is this distinction, that whilst the latter merely is governed, the former also governs; and thus, though every C. is a subject, many subjects are not citizens. In this, which was also the sense

attached to the term by the Romans, when used in its highest meaning—that, viz., of the *civis optimo jure*—it has passed to the modern world, gradually coming to be so understood everywhere. In the heroic ages of Greece, the idea of citizenship was but imperfectly understood. The members of the council and assembly were mere advisers of the kings, who, as god-descended, were regarded as monarchs in the strict sense. But something of the C. character even then attached to the immediate followers of the chief, when regarded in opposition to slaves and strangers; and it was from them that the dominant class sprang, which everywhere overthrew the monarchies, and established the small self-governing states—the democracies, or rather aristocracies, of Greece. At first, the rights of citizenship in Athens and other Greek communities were readily attained by those who were not born to them; but at a later period, when the organization of Greek civic life had reached a high degree of perfection, admission to the roll of citizens was procured with great difficulty. In Sparta, indeed, according to Herodotus, so sparing were they of their national privileges, that there were only two instances of their conferring them in their full measure on strangers. The Perioeci, or strangers by origin, who shared the Spartan territory, though not on equal terms with the Spartans, were probably, as regarded political rights, pretty much in the same position with the Roman plebeians. In Rome, there were perfect and less perfect citizens, whose respective positions are thus described by Savigny in his *History of the Roman Law in the Middle Ages:* "In the free republic, there were two classes of Roman citizens—one that had, and another that had not, a share in the sovereign power. That which peculiarly distinguished the higher class, was the right to vote in a tribe, and the capacity of enjoying magistracy." All the private rights of citizenship (the *jus connubii* and *jus commercii*) belonged to the citizens of the lower class, but the public rights of voting in a tribe, and of enjoying the honors of the magistracy (*suffregium et honores*), were denied them. Under these two classes, again, there were two others—the Latini and the Peregrini.

Roman citizenship was acquired most commonly by birth, but for this, it was requisite that both father and mother should be citizens. If a C. married a Latina, or a Peregrina, even believing her to be a C., the children begotten of the marriage followed the status of the mother. But latterly, it was permitted, by a decree of the senate, to the parents to prove their mistake, and thus to raise both the mother and her children to the rank of citizens. In earlier times, the citizenship could be conferred on a stranger only by means of a *lex*—i.e., by a vote of the people assembled either in one or other of the Comitia (q.v.). It was conferred at a single sweep on the whole of the Latinii and Socii. In the case of some of the provinces, both in Italy and Gaul, the *Latinitas* was given as a step to the *Civitas*, the former being converted into the latter in the case of any one who had exercised a magistracy in his own state or city.

When the imperial power was established, the public rights which formed the chief characteristic of the full Roman citizenship, became little more than empty names; and the only value which thenceforth attached to it consisted in the private rights which it conferred. Such as it was, the constitution of Caracalla extended it to the whole Roman world, the distinctions between Cives and Peregrini and Latini being preserved only in the case of certain individuals, such as freedmen and their children. Even this distinction was abolished by the legislation of Justinian, the only divisions of persons henceforth being into subjects and slaves. A fuller account of this interesting subject will be found in Smith's *Dictionary of Greek and Roman Antiquities.*

In its modern use, the term C. is applied in Great Britain to a dweller in a town, and this either in the general sense of an inhabitant, or in the narrower and stricter sense of one who enjoys its privileges and franchises. In France, it denotes any one who is born in the country, or naturalized in it; and in America, it is used in the same sense, but, so long as slavery was an institution there, slaves were not included in the title. In this latter acceptation, it is equivalent to the term *subject* in England.

CITRIC ACID is an organic acid present to a considerable extent in limes and lemons, and to a less extent in gooseberries, currants, raspberries, strawberries, and other fruits. In preparing C. A., the juice is allowed to ferment, and chalk being added, a precipitate of citrate of lime is formed. This precipitate being treated with sulphuric acid, sulphate of lime is formed, and the acid remains in solution. It is a tribasic acid, having the symbol $C_{12}H_5O_{11}$. It is readily soluble in water, and has an intensely sour taste; it is used in medicine, especially in the form of lemon-juice, as an anti-scorbutic, and in the arts by the silk-dyer to heighten the colors of safflower and cochineal, and by the calico-printer for discharging mordants from cloth. C. A. is a constituent of the finer kinds of lemonade, ginger-beer, etc.

CITRIC ACID ($C_{12}H_8O_{14}$, or $C_{12}H_5O_{11},3HO$) is a powerful tribasic acid, which crystallizes in large transparent colorless prisms. These crystals are readily soluble in water and alcohol, but are insoluble in ether. The crystals contain two atoms of water of crystallization (not expressed in the above formulæ), which are expelled at a temperature of 212°. Citric acid has a strongly acid taste and reaction, and displaces carbonic acid from the carbonates. Its watery solution quickly becomes moldy on exposure to the air, and the acid is then found to be converted into acetic acid. When heated to about 350°, vapor of acetone and carbonic oxide are given off, and a residue of acon-

itic acid ($C_{12}H_6O_{12}$), an acid occurring in the leaves and roots of monkshood and other species of aconite, is left; and when fused with potash, it assimilates the elements of water, and is decomposed into oxalic and acetic acids, as shown in the equation.

Citric Acid. Oxalic Acid. Acetic Acid.

$$C_{12}H_8O_{14} + 2HO = C_4H_2O_4 + 2C_4H_4O_4.$$

These reactions illustrate the changes which organic acids naturally undergo in the vegetable kingdom. It is to the presence of C. A. that a great many fruits owe their agreeable acidity. It occurs in a free state either alone or associated with malic and tartaric acids in oranges, lemons, cherries, currants, raspberries, gooseberries, strawberries, whortleberries, etc., and in several tubers and bulbs, as in the potato and onion. It also exists in combination with potash or lime in potatoes, onions, and artichokes.

This acid, which is almost always prepared from lemon or lime juice, is thus obtained. The juice, after undergoing incipient fermentation, is filtered, and neutralized with chalk; and the insoluble citrate of lime thus formed is decomposed with very dilute sulphuric acid. On the removal of the sulphate of lime that is thus formed by filtration, the solution of C. A. must be concentrated till a film begins to form, when the crystals readily separate on cooling. Citric acid has also been prepared from unripe gooseberries, whose juice is allowed to ferment; and after the removal of the alcohol by distillation, the acid is separated in the way already described: 100 lbs. of gooseberries yield 10 lbs. of spirit of spec. grav. 0.928, and 1 lb. of crystallized acid.

Citric acid is used largely in manufactures; calico-printers employ it for discharging the mordant from the cloth in patterns; and it is used in dyeing silk with safflower, and for heightening the tint of cochineal. The raw material from which the acid for these purposes is obtained "is a black fluid-like thin treacle, which comes from Sicily, and is obtained by inspissating the expressed juice of the lemon after the rind has been removed for the sake of the essential oil."—Watts's *Dictionary of Chemistry*, vol. i. p. 995.

The most important of the numerous salts of C. A. are the citrates of lime, potash, ammonia, and iron. *Citrate of lime* ($C_{12}H_5O_{11},3CaO + 4Aq$) is formed in the preparation of C. A., and is a fine white crystalline powder, more soluble in cold than in hot water. *Citrate of potash* ($C_{12}H_5O_{11},3KO + 2Aq$) is formed by neutralizing the acid with carbonate of potash, and crystallizes in clear deliquescent needles, insoluble in alcohol. *Citrate of ammonia* ($C_{12}H_5O_{11},3NH_4O$) can only be obtained in solution. *Citrate of iron* is prepared by dissolving freshly precipitated peroxide of iron in a warm solution of C. A.; a reddish-brown solution is formed, which, on evaporation, yields brilliant scales of a light-brown color. Excepting the first, all these salts are employed in medicine—the citrates of potash and ammonia as diaphoretics and febrifuges (see AËRATED WATERS), and the citrate of iron as a tonic. Lemon juice, in which C. A. is the most active ingredient, is a most valuable medicine in scurvy, active hemorrhage, rheumatism, etc.; and when it cannot be obtained, C. A. is the best substitute. The general uses of C. A. in combination with an alkali have been already noticed.

CITRON (*citrus medica;* see CITRUS), a tree cultivated in the s. of Europe, and other warm, temperate, or sub-tropical countries for its fruit; a native of the forests of the n. of India. By many botanists, it is regarded as a mere variety (or perhaps the original type) of the species which produces also the lemon, sweet lemon, lime, and sweet lime; by others, these, or some of them, are regarded as distinct species. The C. has oblong toothed leaves; the flowers are externally of a violet color; the fruit is large, warted, and furrowed; the rind very thick and tender; the pulp sub-acid. The pulp is refrigerant; but the part chiefly valued is the rind, which has a delicious odor and flavor, and is made into a very agreeable preserve. The juice is sometimes employed to make a syrup, or, with sugar and water, for a beverage, and for flavoring liquors. The rind and juice may be said generally to be applicable to the same purposes as those of the lemon, but the juice is less acid. The CEDRATE is a variety of the C., from which chiefly the fragrant oil of C., or OIL OF CEDRATE, used by perfumers, is procured. In Germany, the name cedrate is extended to all kinds of C., and the name C. is usually given to the lemon. The varieties of C. are numerous. The fruit of the largest kinds is sometimes 9 in. long, and 20 lbs. in weight. The C. is frequently cultivated in Britain, and by the aid of artificial heat and the protection of glass is produced in great perfection.

It is probable that the C. is meant in some passages of the Old Testament where the word apple is used in the English version.

CITRONELLA, the name of an oil imported from Ceylon and used by perfumers, and also the name of a perfume prepared from common balm; and again, of a liquid brought from the West Indies, and used in France to flavor brandy.

CITROSMA, a genus of trees of the natural order *monimiaceæ*, of which the leaves abound in an oil resembling, if not identical with, oil of citron. They are natives of the tropical parts of South America.

CITRUS, a genus of plants of the natural order *aurantiaceæ*, consisting of trees and shrubs, natives of India and other warm parts of Asia, but many of which are now commonly cultivated in all warm climates on account of their fruit. To this genus belong the ORANGE, CITRON, LEMON, LIME, BERGAMOT, SHADDOCK, POMPELMOOSE,

FORBIDDEN FRUIT, etc. See these heads. It is distinguished by numerous stamens, irregularly united in bundles by their filaments, a pulpy fruit with a spongy rind, and smooth seeds. The leaves and the rind of the fruit abound in volatile oil. The flowers also contain volatile oil, and exhale a peculiar fragrance.

CITTADEL'LA, a t. of northern Italy, in the province of Padua, 14 m. n.e. of Vicenza. It is situated on the Brentella, an affluent of the Brenta, is walled, and has woolen and paper manufactures. Pop. 7,820.

CITTA' DI CASTELLO, a t. of central Italy, 25 m. n.w. of Perugia. C. has a very pleasant situation on the left bank of the Tiber. Though a place of only some 6,580 inhabitants, it is exceedingly rich in ecclesiastical structures of Gothic architecture, palatial residences, and works of art. Raphael painted many of his early works in C. di C.; and they were to be found in churches and private galleries here until the French invasion, when they were dispersed. Two small pictures of this great master still remain in Citta di Castello. Silk-twist is the chief manufacture of the town.

CITTA VECCHIA. See MALTA.

CITY (Fr. *cité*, Lat. *civitas*). In the sense in which it was first used in the Romanic languages of modern Europe, the word C., like its Latin original, was probably equivalent to state (q.v.) (*respublica*) rather than to town or borough (*urbs*, *municipium*); and whilst the latter signified a collection of hearths and households, governed by municipal laws internally, but subject externally to the laws of the country of which they formed a part, the former was applied only to such towns as, with their surrounding district, were independent of any external authority whatever. Nearly the only cities in this sense now are the free towns of Germany, and such of the cantons of Switzerland as consist chiefly of a town and its surroundings, for example, Geneva. But as the ancient Gauls, though composing one nation, were divided into tribes, living in different cantons, each with its town, to which the term *civitas* was applied, and as they also acknowledged a species of central authority, several cities sending delegates to a central one of greater extent and importance to discuss their common affairs, there is reason to believe that the term C. was applied *par excellence* to these central places of meeting, and that it thus, from a very early period, signified a *capital* or *metropolis*, though not independent. In England, the term is said to be confined to towns or boroughs which are or have been the seats of bishops' sees, but this restriction rests on no sufficient ground. "The cities of this kingdom are certain towns of principal note and importance, all of which either are or have been sees of bishops; yet there seems to be no necessary connection between a city and a see."—Stephen's *Com.*, i. p. 124. In America, the term is applied to all towns which are incorporated and governed by a mayor and aldermen. See BOROUGH.

In the case of towns which have grown greatly beyond their original dimensions, it is not unusual to give the name of C. to the space which they originally occupied—thus, we speak of the C. of London, the C. of Paris, or Vienna, etc.

CITY POINT, a village and fort on James river, in Prince George co., Va., 10 m. n.e. of Petersburg, occupied during the war of the rebellion by the union army as the principal landing-place and depot for army supplies.

CITY OF REFUGE. The Jewish law (Numb. xxxv., Deut. iv., Josh. xx.) set apart six cities, three on each side of Jordan, as cities of refuge for the manslayer, in which he might find an asylum, and be safe from the avenger of blood. See BLOOD, AVENGER OF. These cities were Hebron, Shechem, and Kadesh-Naphtali on the w. of Jordan; Bezer, Ramoth-Gilead, and Galan, on the east. The Jews were careful to keep the roads to the cities of refuge clear, and signs were set up to show the way. The manslayer was received and protected in the C. of R. until the death of the high-priest, after which the avenger of blood had no longer any claim against him. Thus this peculiar institution was connected with the typical institutions of the Jewish religion, and partook somewhat of their character, whilst it modified and restrained the avenging of blood. The C. of R. afforded no permanent protection to the murderer, who, if his crime could be proved against him, was to be taken from it that he might be put to death.

CIUDAD' (from the Lat. *civitas*) is the Spanish word for "a city;" and is used as a prefix corresponding to the English affix *town*, as in

CIUDAD BOLIVAR. See ANGOSTURA.

CIUDADE'LA, a seaport t. of the island of Minorca, situated on a plain on the w. coast, in lat. 39° 58′ n., long. 3° 52′ east. It is walled, and has a cathedral, also several convents. The inhabitants, numbering between 7,000 and 8,000, are engaged in agriculture and the manufacture of woolen fabrics. A considerable trade is carried on at the port.

CIUDAD' REAL', a province in s. Spain; 7,543 sq.m.; pop. '70, 264,649. The country consists chiefly of barren plains skirted by lofty hills and mountains, clad with forests, and inclosing deep valleys. The productions are wheat, rye, barley, corn, cattle, horses, asses, sheep, goats, etc. Iron, silver, copper, lead, cinnabar, coal, and marble are found in the mountains. The most famous of the mines is that of quicksilver at Almaden. Hot and cold mineral springs are also found. Considerable manufacturing

is done in wool, linen, cotton, silk, soap, wine, and oil. The chief towns are Manzanares, Almodovar, Valdepeñas, and Calatrava.

CIUDAD REÄL', a t. of Spain, capital of the province of the same name, situated on a plain between the rivers Guadiana and Jabalon, about 100 m. s. of Madrid. It is surrounded with walls in parts ruinous, and has some handsome houses; but, on the whole, it is a poor dull place. It has two or three fine churches—the nave of the parish church being one of the finest Gothic specimens of the kind in Spain—and several monasteries. There are manufactures to a small extent of coarse woolens, linen, and table-cloths, and a trade in the agricultural produce of the district. Pop. 10,500.

CIUDAD RODRI'GO (Roderic's Town), a fortified t. of Spain in the province of Salamanca, about 50 m. s.w. of the city of that name. It is situated on an elevation above the river Agneda, which washes the walls, and is here crossed by a fine bridge. It has a cathedral, the earliest portion of which dates from the 12th century. The town generally has a mean appearance, and is not over-cleanly. During the peninsular war, C. R., though of little strength itself, was considered a place of the utmost importance, as a key of Spain on the w., and was consequently an object of ambition both to the French and the allies. In June, 1810, the French under Massena invested the town, and after a gallant defense by the Spaniards, it was forced to surrender on the 10th July. The fact that Wellington was in the immediate vicinity with an army of 30,000 men, and afforded no relief whatever, was a subject for outcry against the hero; but subsequent events at Torres Vedras showed that his policy was the right one. In Jan., 1812, after a siege of 11 days, the place was assaulted, and after a bloody struggle, the British succeeded in capturing the town. The storming is one of the most brilliant achievements recorded in British military annals, and important as it was brilliant; 150 guns fell into the hands of the captors, besides vast stores of every kind, and the moral effect was even more than proportionately great. Pop. 4,850.

CIVET, *Viverra*, a genus of carnivorous quadrupeds, of the family *viverridæ* (q.v.), having the body elongated, in some of the species as much as in the weasel tribe; the head is also long, and the muzzle sharp. The ears are short, broad, and rounded. The feet have five toes, and the claws are only semi-retractile. There is a more or less conspicuous erectile mane along the back, as in hyenas. Between the anus and the sexual organs, in both male and female, there is a large double pouch, in which is secreted a peculiar odoriferous fatty substance, called *civet*, much used as a perfume. The use of this pouch and its secretion to the animal is not very well known. There are several species of C., of which the best known is the common or African C. (*V. civetta*), a native of the n. of Africa. The common C. is from 2 to 3 ft. long. The height is from 10 in. to a foot; the hair long, brownish gray, with numerous black bands and spots. The C. preys on birds, small quadrupeds, and reptiles, and generally takes its prey by surprise. It is very commonly kept in confinement for the sake of its perfume, which is removed from the bag about twice a week by means of a small spatula, and is obtained most abundantly from the male, and especially after he has been irritated. A dram is a large quantity to obtain at a time. The civets kept for this purpose are fed on raw flesh; the young partly on farinaceous food. The town of Enfras, in Abyssinia, is a principal seat of the C. trade, and great numbers are there kept.

CIVIALE, JEAN, 1792–1867; a surgeon b. in Auvergne, and a pupil of Dupuytren at the hospital of the hotel Dieu in Paris. He was the discoverer of that process of lithotrity, by which the stone in the bladder is crushed and the fragments removed through the natural channel. He was a member of the leading societies, and an officer of the legion of honor. He published a number of works, all relating to his discoveries and practice in lithotrity.

CIVIC CROWN, considered among the Romans more honorable than any other reward. It was given for saving the life of a citizen in battle or assault. It was given to Cicero for his discovery of Catiline's conspiracy, and to the emperor Augustus. The C. C. was merely a wreath, at first of twigs of elm, then of beech, and lastly of oak. The one to whom it was given had the right to wear it always. When he appeared in public, if senators were present, they rose to do him honor, and he was excused from all troublesome duties and services, with the same immunities for his father and his father's father.

CIVIDA'LE, a walled t. of Venetia, Northern Italy, about 10 m. e.n e. of Udine, situated on the Natisone, which is here crossed by a bridge. C. is the ancient *Forum Julii*, and its collegiate church, a fine Gothic edifice, dates from the 8th century. In its archives are contained some valuable manuscripts. It has silk and cotton factories, and a population of some 4,500.

CIVIL DEATH. Death, in a legal point of view, is either natural or civil: the former being the cessation both of physical life and of the legal rights which attach to it: the latter, the cessation of the legal rights whilst the physical life remains. "Civil death occurs where a man, by act of parliament or judgment of law, is attainted of treason or felony; for immediately upon such attainder he loses (subject indeed to some exceptions) his civil rights and capacities, and becomes, as it were, *dead* in law. It also

took place formerly where any man abjured the realm by the process of the common law; or entered into religion, that is, went into a monastery, and became there a monk professed; in which cases he was absolutely dead in law, and his next heir should have the estate. Even in the times of popery, the law of England took no cognizance of *profession* in any foreign country, because the fact could not be tried in our courts; and therefore, since the reformation, this disability is held to be abolished; as also the disability of banishment, consequent upon abjuration, by stat. 21 Jac. I. c. 28." Stephen's *Com.*, vol. i., pp. 142, 143.

CIVIL ESTABLISHMENTS, of the army, comprise certain departments which, though provided for out of the army estimates, are non-military in their organization; such as those connected with the manufacture of munitions of war.

CIVILIAN. This term has three meanings, which are distinct, though intimately related. 1. In a popular sense, it signifies a person whose pursuits are civil; i.e., neither military nor clerical. 2. As a law-term, it means, either a person who is versed in the principles and rules in accordance with which civil rights may be freely, blamelessly, and successfully vindicated in society generally, or in the particular state in which he belongs; or 3. One who has made a special study of these rules and principles as exhibited in the laws and government of Rome (the Roman civil law). The civil law of Rome exercised such influence upon the formation of the municipal systems of almost all the states of modern Europe, that those who devoted themselves to its study were regarded as "civil" or municipal lawyers *par excellence*. From the more learned training which this study demanded, C. came often to be used as synonymous with professor or doctor, as opposed to practitioner of law; the former being generally more deeply versed in the Roman law than the latter; and this in its turn led to its being loosely applied to the international lawyers of the 17th c. (Grotius, Puffendorf, etc.), who generally belonged to the class of civilians in the sense of Romanists, and who, though their subject was altogether different, quoted largely and derived many analogies from the Roman jurisprudence. At present, from our having in Great Britain no class of persons who prosecute law as a *science* as opposed to an *art*, the term C. has reverted to its narrower mediæval sense of student or teacher of the Roman civil law, and thus we speak of Savigny as a C., but not of Story. The special sense in which C. is understood in England will be explained under ECCLESIASTICAL COURTS. See also ADMIRALTY COURTS.

CIVILIZATION. This is a general term to designate the condition of the more advanced nations, as contrasted with those that are looked upon as barbarians or savages. We term the leading nations of Europe civilized; the Chinese and Tartars less so; the Red Indians, Australians, Esquimaux, least of all. "Whatever be the characteristics of what we call savage life, the contrary of these, or the qualities which society puts on as it throws off these, constitute civilization. Thus, a savage tribe consists of a handful of individuals, wandering or thinly scattered over a vast tract of country; a dense population, therefore, dwelling in fixed habitations, and largely collected together in towns and villages, we term civilized. In savage communities, each person shifts for himself: except in war—and even then very imperfectly—we seldom see any joint operations carried on by the union of many; nor do savages in general, find much pleasure in each other's society. Whenever, therefore, we find human beings acting together for common purposes in large bodies, and enjoying the pleasures of social intercourse, we term them civilized." And so of other characteristics. *Dissertations* by J. S. Mill, art. "Civilization."

When we come to seek for an exact definition of the term C., we meet with a variety of views, implying that there is a certain complication in the subject. The original derivation of the word points to that polish of manners that distinguishes the inhabitants of cities (Lat. *cives*) from the rustic population; but the use of the word has greatly outgrown this limitation. Guizot has given a definition, which has become generally known, to the effect that we are to include in C. the improvement of man both socially and in his individual capacity. But the chief difficulty lies in settling what is *improvement*. That people are far from agreed on this point is evident from the use of the phrase, "vices of civilization." How are we to distinguish its vices from its virtues?

The question is very much simplified by making a distinction between *aiming at* the improvement of mankind and really *effecting* that object. All our inventions and discoveries, and all our new arrangements introduced into every department of life, are intended to raise us further and further above the savage condition; nobody denies this; but there may be the widest difference of opinion as to whether any one new device is a real improvement. If we were to restrict the term C. to the changes introduced into human life *with a view* to improvement, the definition of it would present no difficulty, whereas the relation of this to *progress*, or actual improvement, must ever remain open to difference of opinion.

Leaving out of view for the present the disputable matter, C. may be explained as follows: In the first place, there are certain things bearing decidedly on human preservation and human happiness that are to be excluded from the definition. C. is *not* natural advantages—such as those of soil and climate; or the goodness of the mental or bodily constitution of the race; or accidents of fortune favoring our exertions; or individual dexterity or skill that cannot be imparted. It is not necessarily happiness, which

is sometimes present in a low C. and absent in a high. *The permanent changes in the condition and arrangements of man's life effected by his own intelligence and exertions* make up human civilization. It is the *artificial* half of the good we enjoy. Nature has given us so much; our own powers of contrivance give the rest. Genius (in the sense of intellectual originality) is the cause, and C. the effect.

Such being the general definition, the enumeration of the separate departments is the enumeration of the institutions of civilized life. These may be briefly summed up under the following heads:

1. The *industrial arts*, or the devices fallen upon for turning to advantage the material resources and agencies of the globe. Perhaps no one will be found to dispute that these constitute real improvements.

2. The *government*, or system of political organization. It is here that we are most forcibly convinced of the propriety of distinguishing C. from *absolute progress*, or the devices intended for improvement from actual improvement. Scarcely anything in the whole political system of Great Britain, for instance, has commanded unanimous approbation first and last; nearly all the changes have been carried against reluctant minorities, and every now and then voices are raised against institutions accounted by the mass of the nation the very bulwark of our national greatness; as, for example, the parliamentary control of the sovereign authority.

One aim of social reformers has been to make the necessary functions of government compatible with a larger and larger range of individual liberty. The majority of men call this state of things not merely an intended but a real improvement; not merely C., but progress. Still, there is never wanting a class of minds that see only the disadvantageous side of this and all other social innovations.

Connected with liberty, we may also notice the growth of human sentiment in all classes, the governing power included. When we revert to the horrible punishments to which men were subjected in this country not many generations since, not only for real crimes, but out of mere superstitious antipathies, as in the burning of witches, we are apt to feel ashamed of our own ancestors, and to congratulate ourselves on having our lot cast in a milder age.

3. The *arts of social intercourse*, embracing the material machinery of conveyance and communication; and also what may be called the moral machinery, such as forms of procedure for regulating assemblies, and the minor courtesies of life.

4. The scheme of *morality* established in a community appertains to their civilization. But in this, also, difference of opinion prevails, when we compare different countries and times. Morality, in fact, has always been more or less a part of *religion*, which must also be viewed as an institution pertaining to civilized men, whether of their own invention or the result of supernatural communication. In any case, there is mixed up with every religion much that is purely human, and which may be judged of by its tendencies to promote human welfare, like any other arrangement of society. This being the subject of all others that men have most differed upon, no criterion of progress can be laid down, because none would be universally received. The unconverted pagans alive at the final establishment of Christianity, naturally believed that the human mind was thrown backward by that event.

5. *Science* is the least disputed of all the ingredients of civilization.

6. *Literature* and the *fine arts* make part of the C. of mankind. They are a new class of pleasures, superadded to the gratifications of mere sense, and of a kind that can be partaken equally by a large number of people. Instead of rivalry and contention, which are inseparable from the struggle for food, money, or power, the arts tend to sociability and good-fellowship. Every contribution to architecture, painting, music, etc., is a result of human genius, and intended for human pleasure; but there is not the same unanimity in this case as in the former; for many kinds of art are objected to as corrupting the mind; and too great a devotion to art, on the whole, is said to endanger the just balance of men's regards to the serious interests of life.

The above enumeration will amply show how to define the term C., and of what parts the total is made up. It has also been made apparent that the point as to whether any invention be an item of genuine *progress*, is, and ought always to be, an open question. The inventions of original minds intended for placing us further and further from the savage condition, and having that effect, may often be accused of producing new evils, which other arrangements are called for to neutralize. See *Chambers's Papers for the People*, No. 4, *Education of the Citizen*.

CIVIL LAW. See Law.

CIVIL LIST. Down to the period of the restoration in 1660, notwithstanding an attempt at negotiation between James I. and the parliament for the commutation of the hereditary revenues of the crown, the whole expenses of the government of England, civil and military, were included in one list, or rather they were defrayed out of what was called the royal revenue. This revenue arose partly from crown-lands, and partly from other sources, and for a long period after the conquest, it was really at the disposal of the crown. Even after the supplies were provided by parliament, the specific mode of their expenditure continued to be free from parliamentary control. But at the restoration a distinction was made (by statute 12 Charles II.) between the extraordinary

expenses occasioned by war, and the ordinary cost of the civil establishments of the country. For the latter, the needful funds were provided, partly from such crown-lands as were still unalienated, and partly from taxes which parliament voted for the purpose at the commencement of each reign. These were called the hereditary or C. L. revenues. During the reign of William III., the C. L. amounted to £680,000 annually. The branches of expenditure included under this head were the following: 1. The royal household; 2. The privy purse; 3. The royal palaces; 4. The salaries of the chancellor, judges, great officers of state, and ambassadors; 5. The incomes given to the other members of the royal family; 6. The secret-service money, pensions, and other irregular claims. The support of the army and navy was now provided for by an annual vote of the house of commons, and the interest of the national debt was never charged against the civil list. During queen Anne's reign, matters remained nearly on their former footing; but on the accession of George I., the C. L. was raised to £700,000 a year, and on that of George II., to £800,000. George III., notwithstanding that he had surrendered very large portions of the remaining hereditary revenue of England, accepted the last-mentioned sum. But it proved insufficient for the purpose. A large amount of debt was incurred, and in 1769 and 1777, parliament voted sums for his relief, amounting together to more than £1,000,000. In 1777, the C. L. revenue was raised to £900,000, but further deficiencies to the extent of £270,000 had still to be supplied by extraordinary votes. In 1780, Mr. Burke succeeded in abolishing several useless offices, and reducing the expenditure. Notwithstanding these and other efforts in the same direction, it was found indispensable continually to augment the C. L. revenue. In 1804, it was raised to £960,000, and in 1812, to £1,080,000, besides annuities to members of the royal family, which were now paid out of the consolidated fund (q.v.) to the amount of £260,000. When George IV. succeeded to the throne, £255,000 of expenditure was transferred to other funds, and the C. L. was then fixed at £850,000 per annum. The crown enjoyed, in addition, the hereditary revenue of Scotland, amounting to about £110,000, and a separate C. L. was kept up for Ireland of £207,000. Against these large sums, however, were still placed many charges which belonged to the nation rather than the crown; and it was not till the 15th Nov., 1830, that sir Henry Parnell, afterwards lord Congleton, carried a motion for the appointment of a select committee for the purpose of separating the proper expenses of the crown from all other charges. The result of this measure was the act (1 Will. IV. c. 25) for the regulation of the civil list. The sum of £510,000 was now granted to his majesty, and exclusively devoted to the privy purse, the salaries and expenses of the household, secret-service money, and pensions. The separate list for Ireland was discontinued, and the Scotch hereditary revenues and other items were directed to be paid into the exchequer. The change was rather a new distribution, which enabled the country to look more closely into its expenditure, than a real reduction of the civil list.

On the accession of queen Victoria, the C. L., which had long been of the nature of a compact between the monarch and the parliament, and as such beyond the control of parliament during the life of the sovereign, was settled by 1 and 2 Vict. c. 2. The queen surrendered the hereditary revenues of the crown for life, in consideration of a yearly sum of £385,000, to be devoted solely to the support of her majesty's household, and the honor and dignity of the crown. The application of this sum to the particular branches of the queen's privy purse, the salaries and expenses of the household, the royal bounty, alms and special services, is intrusted to the lords of the treasury; and it is provided that if the C. L. charges in any one year shall exceed the total sum of £400,000, an account of the particulars of excess shall be laid before parliament in thirty days. Besides the above sum, £1200 a year is intrusted to her majesty for the payment of pensions, "to persons who have just claims on the royal beneficence, or who, by their personal services to the crown, by the performance of duties to the public, or by their useful discoveries in science, and attainments in literature and the arts, have merited the gracious consideration of their sovereign and the gratitude of their country."

CIVIL SERVICE is a general name for all the duties rendered to and paid for by the state, other than those relating to naval and military matters. At the head of the British C. S., which numbers above 50,000 officials of all grades, are placed the officers of the royal household, under several departments. Then come the officers of the house of lords and the house of commons. Then a vast number of offices or departments, of which the following are the more important: Treasury, home office, foreign office, colonial office, India office, war office, admiralty, board of trade, post-office, customs, inland revenue (including stamps, taxes, and excise), exchequer and audit office, office of woods and forests, office of works and buildings, duchy of Lancaster, public record office, local government board, education department, civil service commission, registrar-general's office, stationery office, ecclesiastical commission, charity commission, patent office, emigration office, Trinity house, heralds' college, law and equity courts, ecclesiastical and admiralty courts, prisons department, British museum, science and art department, diplomatic and consular corps. Several departments peculiar to Scotland and Ireland form distinct lists, not included in the above.

The heads of most of the departments are political officers, changing with the ministry. Others, such as the head of the exchequer and audit department, or the commis-

sioners of customs and of inland revenue, are permanent officials. Excluding the judicial offices, and a few departments where special knowledge is required, the C. S. is open to the public generally, the principle of open competition being in force as regards most of the departments.

In former times appointments to the government offices were obtained mostly by favor; but now, merit and abilities are conditions superadded. By an order in council, dated May 21, 1855, the system was first placed on a new basis, and a commission was appointed to examine all candidates for the service. A candidate being *nominated*, the commissioners in due time notified that he must come up to be examined, and produce certificates of birth, health, and character. The heads of the several departments agree with the commissioners as to the extent and nature of the subjects on which candidates should be examined. The commissioners neither nominate nor appoint; they only examine, and notify the result of the examination.

By an order in council, dated 4th June, 1870, the regulations were altered, the rule of open and unrestricted competition being then introduced, qualified by some exceptions. In certain small and special offices, nomination with subsequent success at an examination remained the rule of entry. But for all the principal departments—the foreign office being the only prominent exception—there is open competition, to which all British subjects of the required age and of good health and character, are admissible. For offices of the superior grade, the age is from 18 to 24, and in the lower division, the age is from 17 to 20. Boy clerks must be over 15 and under 17. Any successful candidate remaining on the list without obtaining an appointment, is struck off at the age of 25. Boy clerks who at 19 fail to obtain appointments as man clerks are also struck off. The first open competition held was on 22d Feb., 1871, when 30 situations in the excise were competed for by a large number of candidates. A further change was made by the introduction of "writers"—a species of "uncovenanted" clerks, who were paid by the hour, were dismissible at pleasure, and had no claim to pension. Writers were first introduced in Aug., 1870, and "boy clerks" were sanctioned in July, 1870.

These various changes (tending in the opinion of the service to lower the status of the officers) and the increased cost of living resulted in great agitation throughout the C. S., and in the appointment of a commission under Dr. Lyon Playfair, to reconsider the whole system of C. S. organization and pay. Following on reports from this commission, considerable changes were made. The decision that the lower grade should have no claim to rise above £200 a year, or to obtain promotion into the higher grade, and the introduction of "duty-pay" as a means of rewarding special responsibilities, may be named amongst the chief alterations. The Playfair commission reported against the employment of temporary writers; and that class of employés ceased to be appointed after the issue of the order in council of 12th Feb., 1876, though a small class of temporary "copyists" is still maintained. The granting of pensions to the C. S. is now regulated by acts passed in 1859 and 1871, the latter allowing the commutation of pensions for a slump sum when these have been granted on abolition or reorganization of office. The rate of pension is one sixtieth of pay for each year's service.

The more important departments of the C. S. will be found briefly described under their proper headings in this work.

CIVIL SERVICE ESTIMATES include all expenses of the state not provided for in the army and navy estimates. As an example of these C. S. E., we will quote the amounts voted under their various heads for the financial year beginning April 1, 1877, and ending Mar. 31, 1878:

Public works and buildings	£1,402,904
Salaries and expenses of public departments	2,609,873
Law and justice	5,039,274
Education, science, and art	3,546,935
Colonial and consular services	550,280
Superannuation and retired allowances, and gratuities	548,318
Miscellaneous and special	28,614
	£13,726,198

CIVIL SERVICE (*ante*), in the United States, was partially introduced in the customs and some other offices in 1877 and the years following, but up to this time (1880) it has made no great progress. The general principles of the system are the same as in England, involving the separation of officials from all absorbing political partisanship, and, in general, the retention of capable and deserving civil officers through successive changes of administration. It involves also the promotion of worthy public servants as vacancies may occur. It lays the foundation for all this in conferring offices, not as reward for partisan services, but on strict competitive examination as to character, capacity, and education. By many it is pronounced both impracticable and undesirable; by others, a fine ideal not likely to be realized; and by others, an indispensable practical reform.

CI'VITA CASTELLA'NA, a t. of central Italy, about 30 m. n.e. of Rome. It is a place of 4,000 inhabitants, picturesquely situated on a plateau of volcanic tufa above the Rio Maggiore; has an old cathedral, and a citadel, now used as a prison. It is, however,

chiefly remarkable on account of the vast number of its Etruscan remains. It occupies the site of the ancient *Falerium Vetus*, one of the 12 cities of the Etruscan league; and *Falerii Novi*, of which also there are many remains, stood about 4 m. to the n. of Civita Castellana.

CIVITA DI PEN'NÉ, a t. of s. Italy, in the province of Teramo, situated on a commanding hill about 20 m. s.e. of Teramo. It is an ancient place, having, under the name of *Pinna*, been the chief city of the Vestini; and some remains are still found here. The modern town, though containing some fine edifices, including the cathedral, is in general badly built. C. di P. is noted for its manufactory of silk-flowers. Pop. 9,800.

CIVITANO'VA, a t. of central Italy, province of Macerata, 12 m. w. of the town of Macerata. Pop., including the port, 8,583. It stands not far from the Adriatic, and has a fine harbor, much frequented. Its lands produce vines, olives, and pasturage. It is an industrial and commercial city.

CIVITA SAN-AN'GELO, a t. of s. Italy, in the province of Teramo, situated near the Adriatic, about 25 m. s.e. of Teramo. It has a pop. of 6,000, and an active trade.

CI'VITA VEC'CHIA, an Italian city in the province of Rome, is situated on the Mediterranean, in lat. 42° 4′ n., long. 11° 45′ e. Its ancient name was *Centum Cellæ*. The harbor of C.V. is one of the best in Italy, and was constructed by the emperor Trajan; the town, indeed, owed its origin entirely to the port of this emperor, and hence it was also known as Portus Trajani. The harbor is formed by two artificial moles projecting into the sea, while a third constructed between the two serves to protect the harbor from the heavy sea; upon this third and outward mole there is a good light-house, some 80 ft. above the level of the sea. Within the port there is a small dock and arsenal. The town of C. V. is small, and has no buildings of any note except a large church in the principal street. The streets are ill paved and narrow, and the inhabitants poor. Pop. about 10,500. It is a free port, and is regularly visited by steam-packets from Marseilles, Leghorn, Naples, Genoa, Messina, and Malta; while the majority of travelers visiting Rome land here. It is famous among the modern Italians for its oysters, which are extremely small, but delicious to the taste.

CIVITEL'LA DEL TRON'TO, a t. of s. Italy, in the province of Teramo, 10 m. n. of Teramo. It is situated on a rock, is fortified and defended by a strong castle. C. del T. is historically interesting as the place where, in 1053, Robert Guiscard and his Normans gained a complete victory over the forces of pope Leo IX. and the emperor Henry III. of Germany; and also for the siege it sustained in 1557 against the French and papal army under the duke of Guise, who was finally forced to retreat.

CLACKAMAS, a co. in n.w. Oregon, w. of the Cascade mountains, drained by the Clackamas and Willamette rivers, and intersected by the Oregon and California railroad. Seven hundred sq.m.; pop. '80, 9,260. It is heavily timbered and has a fertile soil. The chief productions are agricultural. Co. seat, Clackamas.

CLACKMAN'NAN, the co. t. of Clackmannanshire, in the s. part of the co., on the Devon, near its confluence with the Forth, 9 m. e. of Stirling. It lies on ground rising 190 ft. above the rich carse-land of the plain of the Forth, which is also rich in coal, iron, and limestone. C. was formerly a royal burgh, and is mentioned as such in the acts of parliament of James V. in 1540 and 1543. From a bull of pope Celestine III., dated 1195, it appears that at this early date the church and its chapels, together with 40 acres of land, belonged to the abbey of Cambuskenneth. In 1330, king David Bruce resided at Clackmannan. In 1358-59, king David II. confirmed to sir Robert de Bruce the castle and barony of C., with the lands of Kennet and others; and from that period to the present, the Bruces have been proprietors in this parish. Pop. '71, 4,653.

CLACKMAN'NANSHIRE, the smallest co. of Scotland, bounded n. and w. by Perthshire and the Ochil hills; e. by Perthshire and Fifeshire; s. by the Forth, separating it from Stirlingshire. Its greatest dimensions are 10 by 8 m.; area, 48 sq. miles. Pop. '71, 23,747. It chiefly consists of the valley of the North Devon, gently declining from the green Ochil hills to the Forth. The Ochils consist of trap, especially amygdaloid, claystone, porphyry, and greenstone, and rise in Bencleugh (more properly, Benclach), 2,353 ft., and Dunmyat, or Demyat, 1345. A ridge of high ground, with inferior soil, often resting on clay, runs w. through the middle of C., between the very fertile alluvial lands resting on the coal-measures in the s., and the North Devon valley in the n., where the soil is loamy, and rests on gravel, and also on the coal-measures, which extend to the base of the Ochils. The chief minerals are ironstone, sandstone, greenstone, coal, limestone, silver, copper, antimony. The chief rivers are the North Devon, rising in the s. of Perthshire, and the Black Devon, rising in the s.w. of Fifeshire; both run w. across C. into the Forth. The river Forth is navigable for vessels of 500 tons up to Alloa, at which port ships of 700 tons register have been built. The chief crops are wheat, barley, and oats. The number of acres in C., under all kinds of crops, bare fallow, and grass, in 1876, was 15,884; under corn crops, 5,840; under green crops, 1535; clover, sanfoin, and grasses in rotation, 3,279; permanent pasture and meadow land, 4,914. The "Hillfoots" have long been celebrated for their woolen manufactures,

chiefly in tartan shawls and plaids, and have become favorably known in the production of tweeds. The district is likewise famed for its ale, there being seven breweries in the county. There are also extensive distilleries. There are manufactures of green glass bottles, earthenware, bricks, and tiles; also timber trade and ship-building. The chief exports are iron and coal. The columnar greenstone of abbey Craig, near Stirling, has come into use for grinding flour, which it does nearly as well as the French buhrstones. C. contains four parishes. The chief towns are Clackmannan, the co. town; Alloa, the most important place; and Dollar, noted for its endowed educational establishment. C., with Kinross-shire, returns one member to parliament; but the co. occupies the anomalous position of having parishes within its circumference politically—Alva in Stirlingshire, and Tulliallan and Culross in Perthshire—which it does not embrace judicially. In C. have been found Roman stone coffins, sepulchral vases, and old Roman coins. The marquis of Montrose, in 1645, burned castle Campbell, now a noble ruin situated on a wild but easily accessible eminence, on the brow of a hill immediately behind Dollar. In C., George Meikle constructed, in 1787, the first effective thrashing-machine in Scotland.

CLA'DIUM (Gr. *clados*, a branch or twig), a genus of plants of the natural order *cyperaceæ*, of which one species, *C. mariscus*, is a native of Britain, particularly common in the bogs and fens of Cambridgeshire, where hundreds of acres are almost entirely covered with it. It is 3 to 5 ft. high, with a rounded leafy stem, the keel and margins of the leaves rough and almost prickly. It is consequently hurtful to cattle. It is used for thatching, and in Cambridgeshire also for lighting fires. The English name twig-rush has been given to it, but is only of recent invention.

CLADRAS'TIS, a small leguminous tree, resembling the common locust, having a yellow bark with cathartic properties. It is variously called yellow wood, yellow ash, yellow locust, and fustic.

CLAGGETT, THOMAS JOHN, D.D., 1743–1816; a native of Maryland, ordained in England, and the first Protestant Episcopal bishop consecrated on this side of the Atlantic. In 1800, he was chaplain to the U. S. senate, and in 1808, he became rector of Trinity church, Marlborough, Md.

CLAIBORNE, a parish in n.w. Louisiana, on the Arkansas border; 1200 sq.m.; pop. '80, 18,858—10,314 colored. It has an undulating surface partly covered with timber. The chief productions are cotton, corn, wool, and sweet potatoes. Co. seat, Homer.

CLAIBORNE, a co. in s.w. Mississippi, on the Mississippi and the Big Black rivers; 740 sq.m.; pop.'80, 16,768—12,858 colored. The surface is uneven, and the soil is fertile, producing corn, potatoes, cotton, etc. Co. seat, Port Gibson.

CLAIBORNE, a co. in n.e. Tennessee, on the Kentucky border, bounded s. by Clinch river; 350 sq.m.; pop. '80, 13,373—780 colored. It has a rough mountainous surface, but fertile soil, with mines of lead, zinc, and iron. The chief productions are agricultural. Co. seat, Tazewell.

CLAIM, in English law, is a challenge of interest in anything that is in the possession of another, or at least out of a man's own possession. Claims are either verbal or by action, and relate either to lands or to goods and chattels; their object being generally to preserve a title which otherwise would be in danger of being lost.

CLAIM OF LIBERTY is a suit or petition to the queen in the court of exchequer, to have liberties and franchises confirmed there by the attorney-general (Tomlins' *Law Dic.*).

CLAIMS, COURT OF, in the United States, created by act of congress, Feb. 24, 1855, and consisted of three judges appointed by the president and senate, to hold office during good behavior, and to have jurisdiction to hear and determine all claims founded upon any act of congress, or on any regulation of any executive department, or upon any contract, express or implied, with the government of the United States; and all claims which might be referred to it by either house of congress. The United States were represented before it by a solicitor and assistant-solicitor appointed by the president; the solicitor being authorized to appoint a deputy, and the compensation of all members of the court was fixed by law. The court had no power to render a judgment which it could not execute, but reported to congress the cases upon which it had finally acted, the material facts which it found established by the evidence, with its opinion in the case, and reasons therefor, or what was equivalent to an opinion in the return of a judgment as to the rights of the parties upon the facts proved or admitted in the case. By another act, Mar. 3, 1863, two additional judges were to be appointed by the president, and a chief-justice from the whole number of judges (five). The court was also authorized to take jurisdiction of all set-offs, counter-claims, claims for damages, liquidated or unliquidated, or other demands whatsoever on the part of the government against any person making claim against the government in said court. If the judgment of the court be in favor of the government, it shall be filed in the office of the clerk of the proper district or circuit court of the United States, and shall *ipso facto* become and be a judgment of such district or circuit court, and shall be enforced the same as other judgments. If the judgment be in favor of the claimant, the sum thereby

found due to the claimant shall be paid out of any general appropriation made by law for the payment of private claims, on presentation to the secretary of the treasury of a duly certified copy of such judgment. In cases where the amount in controversy exceeds $3,000, an appeal may be taken to the supreme court of the United States at any time within 90 days after judgment. Where the judgment or decree may affect a constitutional question, or furnish a precedent affecting a class of cases, the United States may take an appeal without regard to the amount in controversy. Claims must be filed within six years after the claim accrues, except in cases of disability. The court is required to hold one session annually, commencing on the first Monday in Oct. Members of congress are prohibited from practicing in the court. At the instance of the solicitor of the United States, any claimant may be required to testify on oath. The jurisdiction of the court is not to extend to any claim growing out of any treaty with foreign nations or Indian tribes, unless such claim was pending in said court Dec. 1, 1862; nor shall the jurisdiction of the court extend to any claim against the United States for the destruction, appropriation, or damage of any property by the army or navy engaged in the suppression of the rebellion, from the commencement to the close thereof. Proceedings originate in the court by petition filed; and testimony used in the hearing and determination of claims is taken by commissioners who are appointed for the purpose by the court.

CLAIR, St., a river of North America, being that part of the St. Lawrence, in its largest sense, which carries into lake St. Clair the waters of lake Huron. It is 30 m. long, and half a mile broad, and easily navigable, its depth being 50 feet. Lake St. Clair measures 30 m. in length by 12 in average width, and communicates at its s.w. end with lake Erie by means of the Detroit.

CLAIRAC, a t. of France, in the department of Lot-et-Garonne, situated on the Lot, about 16 m. n.w. of Agen. It has flour and paper mills, and a considerable trade. C. is chiefly interesting, however, as the first place in the s. of France that embraced the doctrines of the reformation, which it did in 1527, on the example of its abbot, Gerard Rouselle. It was the scene of frequent contests between Roman Catholics and Huguenots. Pop. '76, 2,388.

CLAIRAUT, Alexis Claude, an eminent French mathematician, was b. at Paris, May 7, 1713. He early exhibited a most remarkable aptitude for mathematics, and was considered worthy of admission to the academy of sciences, while as yet he was only 18 years of age. C. wrote a great number of scientific papers, but his fame now rests principally upon his *Figure of the Earth,* in which he promulgated the theorem, that the variation of gravity on the surface of the earth, regarded as an elliptic spheroid, was altogether independent of the law of density, the opposite opinion having been previously held; on his explanation of the motion of the lunar apogee, a point left unexplained by Newton; and on his computation of the time of the return of Halley's comet. He died at Paris, May 17, 1765.

CLAIRE, St., or *Santa Clara,* was b. in 1193, of a rich and noble family of Assisi, in the duchy of Spoletto. Attracted by the eloquence and piety of St. Francis of Assisi, she abandoned the pleasures of social life, in which she had previously indulged, and betook herself to solitude, prayer, and mystic meditation. Her imagination, excited by religious emotions, deceived her into the belief that she was in more direct communication with God than her fellow-mortals; and taking her own desires for divine intimations, she founded an order of nuns in 1212, and after obtaining a great reputation for sanctity, died at Assisi, Aug. 11, 1253. Two years afterwards, she was canonized by Alexander IV.

CLAIRE, St., Nuns of the Order of, a religious order founded by St. Claire, with the counsel and help of St. Francis of Assisi, in 1212. At first, the nuns observed the rule of St. Benedict, but in 1224 the austerity of this rule was mitigated by St. Francis, and again modified by Urban IV. in 1264. Those who follow the rule as modified by Urban, are called *Urbanists;* the other and austerer portion of the sisterhood, *Damianists.* The order rapidly increased; and convents are numerous to the present day in Italy, France, Belgium, Bavaria, Asia, and America. The nuns devote themselves chiefly to the education of the young.

CLAIRVAUX, a village in the department of Aube, about 10 m. above Bar-sur-Aube, on the left bank of the river, is remarkable as the site of the once famous Cistercian abbey (Clara Vallis), founded in 1114 by St. Bernard, who presided over it till his death in 1153, when he was buried in the church. Besides the original buildings, a new and splendid convent was afterwards erected, and a church which was reckoned a masterpiece of architecture, but was destroyed at the restoration. There was shown in the convent a monster cask, called "St. Bernard," which contained 800 tuns. The abbey, which had at one time a revenue of 120,000 livres, was suppressed at the revolution, and the extensive buildings are now used as a workhouse and house of correction.

CLAIRVOYANCE. See Somnambulism.

CLAIRVOY'ANCE, as explained by Mr. Hudson Tuttle—whose language is here in part adopted, but with some decided modifications—"must be regarded as a peculiar

state of the mind, in which it is in a greater or less degree independent of the physical body. It presents many gradations from semi-consciousness to profound and death-like trance. However induced, the attending phenomena are similar. The condition of the physical body is that of the deepest sleep. A flame may be applied to it without producing a quiver of the nerves; the most pungent substances have no effect on the nostrils; pins or needles thrust into the most sensitive parts give no pain; surgical operations may be made without sensation. Hearing, tasting, smelling, feeling, as well as seeing, are seemingly independent of the physical organs. The muscular system is either relaxed or rigid; the circulation impeded in cases until the pulse becomes imperceptible; and respiration leaves no stain on a mirror held over the nostrils. In passing into the clairvoyant state the extremities become cold, the brain congested, the vital powers sink, a dreamy unconsciousness steals over the faculties. There is a sensation of sinking or floating. After a time the perceptions become intensified; we cannot say the senses, for they are of the body, which for the time is insensible. The mind sees without physical organs of vision, hears without organs of hearing, and feeling becomes a refined consciousness" which brings it *en rapport* with some intelligence not its own. "The more death-like the condition of the body, the more lucid the perceptions of spirit or mind, which for the time owes it no fealty." So far as clairvoyance depends on the unfolding of the spirit's perceptions, the extent of that unfolding marks the perfectness of the state, and the nature of that to which the spirit's perceptions are unfolded marks the value of the state. As a mere natural condition the state may be conceived of as the same, whether observed in "the Pythia or Delphic oracles, the vision of St. John, the trance of Mohammed, the epidemic catalepsy of religious revivals, or the illumination of Swedenborg or Davis." In all cases, there may be the same general mode of disclosure; but temperament, education, and character give such bias and color as to deprive the mere natural state of all claim to infallibility in teaching, and commonly of all value. A divine illumination, or any degree of value, can be proved in any particular case of clairvoyance, only by evidences aside from the mere state itself. The tendency of the clairvoyant is to make objective the subjective ideas which he has acquired by education or fixed by character; "if a Christian, to see visions of Christ; if a Moslem, of Mohammed; somewhat as dreams reflect the ideas of wakefulness." Yet there is claimed to be "a profound condition which sets all these aside, in which the mind appears to be divested of all physical trammels, and to come in direct contact with the thought-atmosphere of the world—a condition in which time and space have no existence, and matter becomes transparent." It may be found difficult to prove or disprove the last assertion, as it is not evident what is intended by the "thought-atmosphere of the world." By whatever name called, this condition of clairvoyance or trance has been observed among many peoples and nations from the earliest times. How near or remote it has been from the prophetic power, or from the epidemic frenzy of religious or fanatical excitement, from mental ecstasy or epilepsy, it is not our province to determine. Theories, opinions, and judgments upon the causes, conditions, and results of clairvoyance are almost as various as the number of those who have studied its phenomena. The Latin author Apuleius, who wrote in the 2d c. A.D., in his *Discourse on Magic* very clearly refers to the practice of mesmerism or clairvoyance. He says: "And I am further of the opinion that the human mind may be lulled to sleep and so estranged from the body as to become oblivious of the present, being either summoned away from it by the agency of charms, or else enticed by the allurements of sweet odors; and that so all remembrance of what is done in the body having been banished for a time, it may be restored and brought back to its original nature, which no doubt is divine and immortal, and thus, being in a kind of trance, as it were, may presage future events."

CLALLAM, a co. in the n.w. section of Washington territory, lying along the strait of Juan de Fuca and the Pacific ocean; 1720 sq.m ; pop. '80, 638, besides Indians. The soil is fertile; chief business, agriculture. Co. seat, New Dungeness. In the co. and elsewhere in the region are the remnants of a tribe of Indians known as the Clallams, but calling themselves Nuskliyum. In 1870, they numbered about 600, but were rapidly diminishing. Their language is a dialect of the Selish.

CLAM. See CHAMA.

CLAM, in heraldry, is a term for an escalop or cockleshell, and is supposed to indicate that the bearer has been a crusader, or has made long voyages by sea.

CLAM, BEAR'S PAW, *Hippopus maculatus*, a bivalve mollusk of the South Seas, of the family *tridacnidæ*. The shell is described as "perhaps the most beautiful of bivalves, whether in regard to form, texture, or color." It is therefore a favorite shell for ornamental purposes. It is transversely ovate, ventricose, ribbed, roughened with scaly inequalities, white, and spotted with red or purple.

CLAN (Gael. *clann*, Manx *cloan*, meaning "children," i.e., descendants of a common ancestor). This word became incorporated with the English language at least as early as the 17th c., to mean a body of men confederated together by common ancestry or any other tie, and in this sense it is used both by Milton and Dryden. It came to be applied almost exclusively to the several communities of the Scottish highlanders, as

divided from each other topographically and by distinctive surnames. The word has sometimes been applied to those great Irish septs which at one time were a sort of separate states; but these, with their characteristic forms of internal government, were completely broken down by the power of the English predominance, before the word came into familiar use in the English language. In Scotland it was used in the 16th c. to designate the free booters of the border as well as the Celtic tribes of the highlands; and there were two characteristics common to both—their predatory habits, and their distribution into communities, each with a common surname. In the act of the Scottish parliament of 1587, for instance, which requires landlords to find security for the conduct of their tenants, it is provided that those "who have their lands lying in far highlands or borders, they making residence themselves in the inlands, and their tenants and inhabitants of their lands being of clans, or dependars on chieftains or the captains of the clans, whom the landlords are noways able to command, but only get their mails (or rents) of them, and no other service or obedience, shall noways be subject to this act but in manner following." Then follow provisions for enforcing the law directly on the chieftains or captains of those clans residing in territories where the owner of the soil—generally the merely nominal owner, in terms of some useless charter—had no control. It was always the policy of the old law of Scotland to require all the highland clans to have some respectable representative—a man of rank and substance, if possible—who should be security at court for their good conduct. Clans that could find no security were called "broken clans," and their members were outlaws, who might be hunted down like wild beasts. The Macgregors were a celebrated broken C., whom the law pursued for centuries with savage ingenuity. Among other inflictions their name was proscribed, and such members of the C. as endeavored to live by peaceful industry in the lowlands, adopted derivations from it; hence we have the names of Gregor, Gregory, and Gregorson or Grierson. The clans are never treated in the old Scots acts with any respect, or otherwise than as nests of thieves and cutthroats. The following passage in the act of 1581 (c. 112), which virtually authorizes any lowlander, injured by any member of a C., to take vengeance against all or any of his clansmen, contains a picturesque, though, for a legislative enactment, certainly a very highly colored account of the social condition of the highland clans in the 16th century. "The said clans of thieves for the most part are companies of wicked men, coupled in wickedness by occasion of their surnames or near dwellings together, or through keeping society in theft or receipt of theft, not subjected to the ordinar course of justice, nor to ony ane landlord that will make them answerable to the laws, but commonly dwelling on sundry men's lands against the good-will of their landlords, wherethrough true men oppressed by them can have no remeid at the hands of their masters, but for their defense are oftentimes constrained to seek redress of their skaiths of the hail clan, or such of them as they happen to apprehend. Likewise the hail clan commonly bears feud for the hurt received by any member thereof, whether by execution of laws, or order of justice, or otherwise." The highland clans are often carelessly spoken of as a feudal institution, but in reality their distinctive character cannot be better understood than by keeping in view some peculiarities which set them in complete contrast with the feudal institutions of Britain. All feudality has a relation to land, from the serf bound to the soil through the free vassal who possesses it, up to the superior or feudal lord, who commands services out of it. The descent to all rights connected with it is hereditary. Among the highlanders, on the other hand, the relation was patriarchal, and had no connection with the land, save as the common dwelling-place of the tribe. It often happened, as the acts above quoted explain, that the head of a C. and the owner, according to feudal law, of the estates occupied by it, were two different persons. Clans did not acknowledge the purely feudal hereditary principle, and would elevate to the chiefship a brother or an uncle, in preference to the son of a deceased chief. It is a curious illustration of this, that in the rebellion of 1715, the notorious lord Lovat, who had just returned from France, being acknowledged by the C. Fraser as their chief, drew them away from the rebel army, to which the proprietor of the Fraser estates had endeavored to attach them, and arrayed them on the government side.

CLAN MACDUFF', Law of, was a privilege of immunity for homicide anciently enjoyed by those who could claim kindred with Macduff, earl of Fife, within the ninth degree. Macduff's cross stood on the march or boundary between Fife and Strathearn, above Newburgh; and any homicide possessed of the right of clanship who could reach it, and who gave nine kye (cows) and a colpindash (or young cow), was free of the slaughter committed by him. (Bell's *Dictionary.*)

CLANDESTINE MARRIAGE. A marriage contracted without the due observance of ecclesiastical ceremonies, even where concealment was not the chief or only object of the parties, is generally called a clandestine marriage. But, in Scotland, a distinction is made between marriages which are clandestine, and those which are simply irregular. All marriages which are not celebrated by a clergyman after proclamation of bans are irregular, and such of these irregular marriages as are entered into before a person professing to act as a religious celebrator, without being a minister of religion, are clandestine, and expose the parties, the celebrator, and witnesses to certain penalties.

These penalties may be recovered before justices of the peace, on complaint by the fiscal; and the proceeding is not without some advantage to the parties, as the conviction is received as evidence of the marriage. In the eye of the law, clandestine and irregular marriages in Scotland are as valid as those in the face of the church, provided they be of such a kind as to establish the consent of the parties to become man and wife in point of fact. But, notwithstanding the existence of this rule of the civil law, marriages in Scotland, in any other form than *in facie ecclesiæ*, are practically of very rare occurrence. Persons convicted before a magistrate of an irregular marriage are required to register such marriage, and the magistrate is bound to give notice of the conviction to the registrar; and if the irregular marriage is established in a competent court, the clerk of the court is give notice (17 and 18 Vict. c. 80). To put a stop to Englishmen crossing the border, merely in order to celebrate irregular marriages, it was enacted by 19 and 20 Vict. c. 96, "that after the 31st Dec. 1856, no irregular marriage shall be valid in Scotland, unless one of the parties has lived in Scotland for the 21 days next preceding the marriage, or has his or her usual residence there at the time." It is further enacted, that the parties to such a marriage may apply within three months, *jointly*, to the sheriff or sheriff-substitute of the county, for a warrant to register it. Upon proof that one of them had lived for 21 days, or usually resided in Scotland, and that they have contracted marriage, the sheriff is to grant a warrant to the registrar of the parish to record the marriage. A certified copy of the entry, signed by the registrar, which he must give for 5*s*., is declared to be evidence of a valid marriage.

CLANDESTINE MORTGAGE, in England, is a second mortgage of lands, already mortgaged for a valuable consideration, the first mortgage being concealed, or not discovered in writing to the second mortgagee. It is provided by 4 and 5 Will. and Mary, c. 16, that in such circumstances the mortgager, or person so mortgaging his lands, shall have no relief, or equity of redemption, against the second mortgagee.

CLAP, ROGER, 1609–91; a native of Devonshire, England; one of the founders of Dorchester, Mass. He held several prominent positions, but is known chiefly by his memoirs of leading men of New England.

CLAP, THOMAS, 1703–67; a minister settled at Windham, Conn., in 1727, and in 1739 elected president of Yale college, holding the chair for 27 years, and doing great service to the institution. Through his efforts a college building and chapel were erected. He published a history of the college, and intended to write a history of Connecticut, but his materials were lost or carried away during the raid upon New Haven by the British under gen. Tryon.

CLAPARÈDE, JEAN LOUIS RENÉ ANTOINE ÉDOUARD, 1832–70; a Swiss naturalist, who studied medicine and natural science at Berlin. He devoted himself especially to the study of echinoderms, infusoria, and rhizopods, in which he was joint laborer with J. Müller, Ehrenberg, and Lachmann. In 1857, he became professor of comparative anatomy in the Geneva academy, and subsequently visited England and the Hebrides. For the benefit of his health, he resided for some time in Naples, where he published an important work on the annelidæ of the gulf. He bequeathed his library to Geneva, his native city.

CLAP-NET, a kind of ground-net much used by the bird-catchers of the s. of England, who supply the London market. It consists of two equal parts or sides, each about twelve yards long, by two yards and a half wide, and each having a slight frame. These are placed parallel to one another, fully four yards apart, and by an ingenious contrivance, the pulling of a string is made to close them upon one another, so as to cover the oblong space between them. Call-birds, either in small cages, or fixed by braces, are placed about the net to decoy wild birds to the spot.

CLAPP, THEODORE, 1792–1866; a native of Massachusetts, graduated at Yale in 1814, studied theology at Andover, and in 1822, became pastor of the first Presbyterian church in New Orleans. In 1834, he became a Unitarian, and organized a church which included a large portion of his Presbyterian charge. He was highly esteemed for his faithfulness to duty in seasons of yellow fever, having labored unceasingly through 20 of these epidemics. His only published work is *Autobiographical Sketches and Recollections*.

CLAPPERTON, HUGH, one of those British travelers that led the way in exploring the interior of Africa, was b. at Annan, in the co. of Dumfries, Scotland, in 1788. At the age of 17, he went to sea; and being impressed into a man-of-war, he distinguished himself by his services, and was appointed to the rank of lieutenant. In 1817, he returned to England on half-pay. Having become acquainted in Edinburgh with Dr. Oudney, who was about to proceed to Bornu as British consul, the thoughts of C. were directed to Africa; and government appointed him and lieut. Denham to accompany Oudney in an exploring expedition into the interior of that continent. After a short stay at Tripoli, they started in Feb., 1822, for Bornu, where Denham separated from his companions, in order to carry his researches southward. C. proceeded westward, accompanied by Oudney, who died by the way. He still pushed on alone as far as Sakkatu, but not being allowed to proceed further westward, he retraced his steps, and, in company with Denham, returned to England in 1825. The journey had done much for the knowledge

of Africa, but the great geographical problem of the course of the Niger was still much in the same position. To solve it, if possible, C.—the rank of commander having been conferred upon him—started again in Aug., 1825, in company with capt. Pearce, R.N., Mr. Dickson, and Dr. Morrison. He had also Richard Lander as his confidential servant. They commenced their exploration into the interior from the Bight of Benin. His companions died early on the journey, but C. and his faithful attendant, Lander, reached Sakkatu. Detained here by the sultan, Bello, the vexation joined to the hardships of the journey so affected his health, that he died at Changary, near Sakkatu, April 13, 1827. C. was the first European that penetrated from the Bight of Benin into the interior of Africa, and followed the course of the Niger for a great way. Though without scientific education, he was an intelligent and unprejudiced observer, and made important additions to geographical knowledge.—*Narrative of Travels and Discoveries in Northern and Central Africa in the years* 1822–23–24, *by Denham, Clapperton, and Oudney* (Lond. 1826); *Journal of a Second Expedition into the Interior of Africa, etc.* (Lond. 1829); *Records of Clapperton's Last Expedition to Africa*, by Richard Lander (Lond. 1830).

CLAQUE (from Fr. *claquer*, "to clap the hands," or "applaud") is the name given to a contrivance for securing the success of a public performance or production, by bestowing upon it preconcerted applause, and thus giving the public, who are not in the secret, a false notion of the impression it has made. This artifice first came into operation in theaters and concert-rooms, and arose from friendly or party motives; but it is to be feared that it has spread into other departments of public life, not excepting even parliaments.

It was in Paris that it was first regularly organized and turned into a trade. One Sauton, in 1820, established an office for the insurance of dramatic success (Assurance des Succès Dramatiques), and was thus the organizer of the Parisian "claque." The directors or managers of a theater send an order to the office for whatever number of "claqers" they think necessary. If the success of a piece seems doubtful, as many sometimes as from 300 to 500 of these people are furnished with gratis tickets, and are often instructed at the rehearsals at what particular places they are specially to applaud. How minutely the art is organized, may be seen from the exact division of functions among the several claquers. The "commissar" is bound to learn the play by heart, and call the attention of the audience about him to the various beauties of the piece; the "rieur" must laugh at every jest; the "pleureur" (weeper) has to manifest his sensibility at the moving passages. This last part is generally assigned to women, in whom the frequent use of the handkerchief seems most natural. The "chatouilleur" (tickler), on the other hand, endeavors, by distributing bonbons, snuff, theater-bills, etc., and by lively conversation, to keep his neighbors in good-humor; and lastly, the "bisseur" calls *encore!* with the utmost enthusiasm, at the conclusion of the specified pieces of music.

The following incident, which found its way into the newspapers on the occasion of the death of the famous French actress, Mademoiselle Rachel, shows the ludicrous seriousness with which the members of the C. view their singular profession: Mademoiselle Rachel had just created a new character in a modern piece, and during the first evening, was loudly applauded. The next, however, she thought her reception by no means so warm, and she complained of it, adding that the C. did not do its duty. It turned out that the head of the C. had been ill, and that his place that evening had been supplied by a *confrère* from another theater. This individual, on hearing of the complaint that had been made, wrote to mademoiselle as follows: "MADEMOISELLE—I cannot remain under the obloquy of a reproach from such lips as yours! The following is an authentic statement of what really took place: At the first representation, I led the attack in person not less than 33 times. We had three acclamations, four hilarities, two thrilling movements, four renewals of applause, and two indefinite explosions. In fact, to such an extent did we carry our applause, that the occupants of the stalls were scandalized, and cried out, '*A la porte!*' My men were positively extenuated with fatigue, and even intimated to me that they could not again go through such an evening. Seeing such to be the case, I applied for the manuscript, and after having profoundly studied the piece, I was obliged to make up my mind for the second representation to certain curtailments in the service of my men. I, however, applied them only to MM. ——, and if the *ad interim* office I hold affords me the opportunity, I will make them ample amends. In such a situation as that which I have just depicted, I have only to request you to believe firmly in my profound admiration and respectful zeal; and I venture to entreat you to have some consideration for the difficulties which environ me."

The allegation that in London theatrical artists and managers are obliged to endeavor to insure success by means of a similar institution, is strenuously denied. Although no public offices of the kind have yet been established in Germany, the artifice is extensively practiced, to the perversion of the public judgment and the detriment of art.

CLARAC, CHARLES OTHON FRÉDÉRIC JEAN BAPTISTE, Count, 1777–1847; a native of Paris, an artist and antiquary. He superintended the excavations at Pompeii, of which he gives an account in *Fouilles faites à Pompeii*. He was for a time a member of the French embassy in Brazil, and on returning to Paris, was made keeper of the museum of antiquities in the Louvre, of which museum he published a catalogue. Others of his

works are *Manuel de l'Historie de l'Art chez les Anciens*, and *Musée de Sculpture Antique et Moderne*.

CLARE, a co. in central Michigan, on the head-waters of Muskegon river, reached by the Flint and Pere Marquette railroad; 650 sq.m.; pop. '80, 4,187. It is mostly covered with forests. Co. seat, Farwell.

CLARE, a maritime co. in the province of Munster, Ireland, bounded n. by Galway and Galway bay; e. and s. by the Shannon, and its expansion lough Derg, separating it from Tipperary, Limerick, and Kerry; w. by the Atlantic. It lies between lat. 52° 32′ and 53° 7′ n., and long. 8° 25′ and 9° 58′ west. It is seventh in size of the Irish counties; length, 67 m.; greatest breadth, 38; average, 21; area, 1294 sq.m.—more than a half being arable, and a hundredth in wood. The surface is mostly hilly, with some mountains, bog, marsh, and rugged pasture. There is an undulating plain in the center, from n. to south. On the e., lie the Inchiquin, Slieve Baughta, and Slieve Barnagh mountains, the highest being 1758 ft., with rich pastures between. The mountains on the w. rise in Mt. Callan to 1282 feet. In the s., along the rivers, are rich loamy pastures called corcasses. The coast-line is 140 m. along the sea, and 80 along the Shannon estuary. The sea-line is high and rocky, in parts precipitous, with many isles and fantastic detached rocks. For 5 m. at Moher, the coast rises 400 ft. nearly perpendicular, and at another point 587 feet. The chief rivers are the Shannon (q.v.), and the Fergus, running s. 27 m. through the middle plain, and by an estuary 5 m. broad. The county has about 100 small lakes. Carboniferous limestone is a prevailing formation in the county. The s.w. third of the county forms part of the Munster coal-field, with beds of ironstone, and thin seams of coal and culm. C. has mines of lead, copper pyrites, and manganese; slate and flag quarries; a black marble quarry near Ennis; and many chalybeate springs. The soils are warm and friable on limestone, deep rich loam on the Shannon, and cold and wet, with bogs and much timber on the coal tracts. Part of the limestone district is flooded in winter, but affords rich pasture in the summer, when the water dries up. In some places, spring-water is very scarce, and water can only be procured from the neighboring corcasses. The climate is moist and mild, but with frequent violent gales from the Atlantic. In 1875, 147,754 acres were under crops, the chief crops being oats, potatoes, wheat, barley, and turnips. The chief trade is in grain and provisions. Fine sheep and cattle are reared on the pastures. Fish are caught on the rivers in the native wicker-boats. The chief manufactures are coarse linens, hosiery, flannels, and friezes. C. is divided into 11 baronies, 80 parishes, and seven poor-law unions, with parts of three others. The chief towns are Ennis (the county town), Kilrush, Ennistymon, and Killaloe. Pop. in '41, 286,394; in '51, 212,428; in '71, 147,864, of whom 144,440 were Roman Catholics, 3,027 Protestant Episcopalians, 220 Presbyterians, and the rest of other denominations. In 1875, C. had 31,234 pupils on the rolls of the national schools. It returns three members to parliament, two for the county, and one for Ennis. C. has many cromlechs, raths, remains of abbeys, and old castles or towers, and several round towers, one at Kilrush being 120 ft. high. C., till the time of Elizabeth, was called Thomond. An adventurer called Clare gave it its present name.

CLARE, JOHN, 1793–1864; known as the *Northamptonshire Peasant Poet*, the son of a farm laborer. He was taken from school at the age of 7, and set to watching geese and sheep; at 12 he worked on a farm, paying for such education as he could get in earnings from his meager wages. He tried to get a place in a lawyer's office, but failed; studied algebra; fell in love; became a pot-boy in a public-house; was apprenticed to a gardener; ran away; enlisted in the militia; lived among the gypsies; worked as a lime-burner, and at the age of 25 was compelled to seek parish relief. Two years after, he published *Poems Descriptive of Rural Life and Scenery*," and in the following year his *Village Minstrel and other Poems*. He became famous, was patronized and flattered, and overrun with curious visitors, fell into dangerous habits, and died a madman in a lunatic asylum.

CLARE COLLEGE, CAMBRIDGE, founded 1326, under the name of University hall, by Richard Badew, was burned in 1338, and rebuilt and endowed by Elizabeth, countess of Clare. Chaucer calls this college "Solere" hall. It has a master, 8 senior and 10 junior fellows. The 18 fellowships are open to gentlemen of the degree B.A. or a higher, without restriction as to marriage. The master is elected by the senior and junior fellows. The buildings, which are in the renaissance style, are amongst the most pleasing in the university. Richard III., pretending himself to be descended from the foundress, claimed the patronage of this hall. The chapel was built in 1535, previous to which an aisle of St. Edward's church, where the masters and fellows were anciently interred, was used for the purpose.

CLARE ISLAND, an island of Ireland, belonging to the county of Mayo, situated in the Atlantic, at the entrance of Clew bay. It has a length of 4½ m., with a breadth of 2 miles. On its n.e. extremity, there is a light-house at an elevation of 487 ft. above the sea. Lat. 53° 49′ 30″ n., long. 9° 55′ 30″ w.

CLAREMONT, a t. in Sullivan co., N. H., on the Connecticut river, and the southern division of the Vermont Central railroad; 48 m. n.w. of Concord; pop. '70,

4,053. The principal village is 3 m. from the Connecticut, on the Sugar river, which furnishes abundant water-power, employed in the manufacture of cotton, wool, and paper. The Stevens high school, founded by Paran Stevens, a hotel-keeper first in Claremont and afterwards in Boston and New York, is the principal public institution.

CLAREMONT, a mansion or country-seat at Esher, Surrey, built by a noble family of that name. When the princess Charlotte, heiress-apparent to the crown of England, was married to prince Leopold of Saxe-Coburg, C. was assigned as their residence; and at the death of the princess in 1817, the use of it was continued to the widower for life, along with the allowance settled on him of £50,000. The prince lived here till his election as king of Belgium, after which time he only occasionally visited it. After the revolution of Feb., 1848, he placed it at the disposal of his father-in-law, ex-king Louis Philippe, who inhabited it till his death in Aug., 1850, and whose family have since continued to reside there. C. has been to the younger line of the house of Bourbon what Frohsdorf is to the elder, and has been the scene of more than one congress of the leading Orleanists.

CLARENCE, DUKE OF, the title occasionally given to a younger male member of the British royal family.

CLARENCIEUX, the first of the two provincial kings-of-arms, in England, the second being Norroy. The jurisdiction of C. extends to all England s. of the Trent, that of Norroy (q.v.) comprehending the portion n. of that river. C. is named after the duke of Clarence, third son of king Edward III. It is his duty to visit his province, to survey the arms of all persons bearing coat-armor within it, to register descents and marriages, and to marshal the funerals of all persons who are not under the direction of *Garter*. He also grants arms within his province, with the approval of the earl marshal.

CLARENDON, a co. in e. South Carolina, bounded on the s. and w. by the Santee; 700 sq.m.; pop. '80, 19,190—12,908 colored. The surface is generally even and the soil fertile, producing corn, cotton, rice, etc. Co. seat, Manning.

CLARENDON, a t. and village in Rutland co., Vt., on Otter creek and the Western Vermont railroad, 6 m. s. of Rutland; pop. of township, '80, 1105. C. is much visited for its mineral springs, the waters of which are said to be useful in kidney and cutaneous diseases.

CLARENDON, CONSTITUTIONS OF, were laws made by a parliament, or rather by a general council of the nobility and prelates, held at Clarendon, a village in Wiltshire, in 1164, whereby king Henry II. checked the power of the church, and greatly narrowed the total exemption which the clergy had claimed from the jurisdiction of the secular magistrate. These famous ordinances, 16 in number, defined the limits of the patronage, as well as of the jurisdiction, of the pope in England, and provided that the crown should be entitled to interfere in the election to all vacant offices and dignities in the church. The constitutions were unanimously adopted, and Becket, the primate, reluctantly signed them, at the solicitation of his brethren. But they were at once rejected by pope Alexander III., when sent to him for ratification, and Becket thereupon immediately retracted his consent, and imposed upon himself the severest penances for his weakness in giving it. This, and the other measures adopted by the haughty and imperious archbishop, to vindicate the independence of his order, led to the unhappy disputes between him and the monarch, which terminated in the famous tragedy at Canterbury, commonly known as the *martyrdom* of St. Thomas-à-Becket, the canonization of the saint, and the pilgrimages to his tomb, which subsequently became an institution of the Roman Catholic church. Notwithstanding the personal humiliation to which Henry submitted after Becket's death, most of the provisions of the constitutions of C. continued to be permanent gains to the civil power. A masterly and dispassionate appreciation of the constitutions of C. will be found in Dr. Pauli's *Geschichte v. England;* and in prof. Stubbs's *Select Charters illustrative of English Constitutional History*, the text of the constitutions is given.

CLARENDON, EDWARD HYDE, Earl of, an English historian and statesman, son of a private gentleman, was b. at Dinton, Wiltshire, 18th Feb., 1608, and educated at Oxford. He studied law under his uncle, Nicholas Hyde, chief-justice of the king's bench; was a member of the Long parliament, and for some time spoke and voted on the side of the popular party; but on the breaking out of the civil wars in England, he attached himself to the royal cause, and in 1642 was appointed chancellor of the exchequer, knighted, and sworn of the privy council. Accompanying prince Charles (Charles II.) to Jersey, he remained there for two years, and began his *History of the Rebellion* (London, 1702–4; continuation, with Life, 1759), and also wrote the various papers which appeared in the king's name, as answers to the manifestoes of the parliament, and which far surpassed in vigor and elegance the productions against which they were directed. In May, 1648, he went to Paris, and in Nov., 1649, was sent on an unsuccessful mission for assistance from the Spanish court. He afterwards proceeded to the Hague, where, in 1657, Charles II. appointed him high chancellor of England. At the restoration, he was confirmed in that office, and elected chancellor of the university of Oxford. In Nov., 1660, he was created baron Hyde, and in April following, viscount Cornbury, and earl of Clarendon.

In 1663, the earl of Bristol accused him of high treason in the house of lords; and though this charge failed, public indignation was excited against him by the ill success of the war with Holland, and the sale of Dunkirk to the French. The victim also of some court intrigues, he was deprived of his offices; and he secretly withdrew to Calais, whence he sent his apology to the lords; but this writing was ordered, by both houses of parliament, to be burned by the common hangman. After living six years in exile, he died at Rouen, Dec., 1674, and was buried in Westminster abbey. His daughter, Anne Hyde, became the wife, in 1659, of the duke of York, afterwards James II., and was the mother of Anne and Mary, both queens of Great Britain.

C. was, on the whole, both well-intentioned and wise. There can be no doubt that he loved his country sincerely, and was humanely and liberally disposed. He was too moderate for the troublous times in which he lived. Lacking enthusiasm, he failed to appreciate the position of the Puritans; and after a brief period spent in their service, he passed over to the camp of the royalists, but was never a bigoted partisan. His firmness, however, was not equal to his sagacity, and hence arose the perplexities which ultimately occasioned his fall. C.'s private character was excellent, in an age when virtue was utterly unfashionable among noblemen.

CLARENDON, George William Frederick Villiers, Earl of, a distinguished English statesman, was b. 12th Jan., 1800. He was a descendant of Thomas Villiers, who, in 1752, married the heiress of the last lord Clarendon of the Hyde family, and was, in 1756, made baron Hyde, and in 1776, earl of Clarendon. Having studied at Cambridge, he early entered the diplomatic service, and in 1833 was appointed to the then important post of ambassador at Madrid, where he acquired great influence, which he employed in establishing the government of Spain on a constitutional basis. On the death of his uncle, the third earl, without issue, in 1838, he succeeded to the title, and returned to England to take his seat in the upper house. In 1840, he was appointed keeper of the great seal. When the Whig ministry was broken up in 1841, he became an active member of the opposition; but warmly supported sir Robert Peel in his measures for the abolition of the corn-laws. Under lord John Russell's premiership, he became president of the board of trade in 1846, and the following year was appointed lord-lieutenant of Ireland. He entered upon his duties in troublous times. The insurrectionary follies of Smith O'Brien and his coadjutors might have set the whole country in a blaze, but for the prompt and decisive measures which C. adopted, and which soon restored general tranquillity. At the same time, his tact and impartiality contributed to ally and reconcile the exasperations of party. The severity of his proceedings against the Orangemen on occasion of disturbances in 1849, was made the subject of a formal accusation in the house of lords; but C. made a convincing defense, and ministers declared their complete approval of his proceedings. When the Russell cabinet resigned in 1852, C. was replaced by the earl of Eglinton; but on the formation of the Aberdeen ministry, in a later part of the same year, he was intrusted with the seals of the foreign office. When lord Palmerston became premier in 1855, C. held the seals until the resignation of the ministry in 1858. He resumed them, under the same premier, in 1865; retired with his colleagues in 1866; and taking the same office once more in 1868, he retained it till he died in June, 1870.

CLARENDON PRESS, a printing establishment connected with Oxford university (England); founded in 1672, and named Clarendon, because the printing-house was paid for by the profits on the sale of Lord Clarendon's *History of the Rebellion*, of which work the university has a perpetual copyright.

CLARET (Fr. *clairet*), a term originally applied to wines of a light-red color, but which is now used in England as a general name for the red wines of Bordeaux (q.v.). The name as used in England is unknown in France.

CLARI, Giovanni Carlo Maria, b. 1669; an Italian composer of music, pupil of Colonna, chapel-master, and author of the opera *Il Savio delirante*. He wrote also church music, duets, and trios.

CLARIFICATION is the process of clearing a fluid from a turbid condition, as in the case of beer (q.v,), or in the action of gelatine in fining British wines. Natural waters containing much organic matter in mechanical suspension and in chemical solution, are clarified by the addition of a little alum, which is precipitated with the organic matter, and the water then becomes healthy and refreshing. Liquids are often clarified by straining through several layers of cloth; and the addition of cold water to hot coffee, etc., causes a deposit to be thrown down, which clears the solution. The use of the clearing nut (q.v.), for clarifying water, is general in India.

CLARINET, or Clarionet', a wind-instrument of the reed kind, invented by Joseph Christoph Denner, in Nürnberg, in 1690. Its tone is produced by a thin piece of Spanish reed nicely flattened and tied, or otherwise fixed on the mouth-piece. On the body of the instrument there are holes and keys for the fingers of the performer, by which the notes are produced. In extent, fullness, and variety of tone, the C. is the most perfect of wind-instruments. Its construction, however, does not admit of every key in music being played on the same instrument, for which reason clarinets of different pitch are used in orchestral music—viz., the C C., which plays all the notes as they are written;

the B flat C., a whole tone below the C; and the A C., a minor third below the C. In military music, an E flat C., a minor third above the C one, is much used.

CLARION, a co. in n.w. Pennsylvania, on the Alleghany and Clarion rivers, traversed by the Alleghany railroad, 600 sq.m.; pop. '80, 40,326. Surface hilly, and soil fertile, producing wheat, corn, oats, rye, buckwheat, butter, wool, etc. Co. seat, Clarion.

CLARION, or CLAR'IN, a species of trumpet, more shrill in tone than the ordinary one; also the name of an organ-stop of four feet pitch.

CLARK, a co. in e. Illinois, bordering on Indiana, and bounded on the s.e. by Wabash river, intersected by the St. Louis, Vandalia, Terre Haute and Indianapolis railroad; 460 sq.m.; pop. '80, 21,900. The chief business is agriculture. Co. seat, Marshall.

CLARK, a co. in central Kentucky, bounded by the Red and Kentucky rivers on the s.; intersected by the Lexington and Big Sandy railroad; 210 sq.m.; pop. '80, 12,113—4,185 colored. It has a hilly and broken surface, with unusually fertile soil; chief products, wheat, corn, butter, and wool. Co. seat, Winchester.

CLARK, a co. in s.e. Mississippi, on the Alabama border, intersected by the Mobile and Ohio railroad; 650 sq.m.; pop. '80, 15,022—7,792 colored. The region is hilly, and occupied chiefly by pasture lands. The crops are corn, cotton, rice, etc. Co. seat, Quitman.

CLARK, a co. in s.w. Ohio, on Mad river, traversed by the Cincinnati, Sandusky and Cleveland, the Pittsburg, Cincinnati and St. Louis, and a branch of the Cleveland, Columbus, Cincinnati and Indianapolis railroads; 380 sq.m.; pop. '80, 41,947. The surface is diversified; soil fertile, with plenty of timber, and well watered. The chief products are wheat, corn, oats, potatoes, butter, wool, and flax. Co. seat, Springfield.

CLARK, a co. in Wisconsin, on the Black and Eau Claire rivers, reached by the w. branch of the Milwaukee and St. Paul railroad; 1548 sq.m.; pop. '80, 10,715. It has a hilly surface and fertile soil. Agriculture is the chief business. Co. seat, Neilsville.

CLARK, ABRAHAM; 1726–94; one of the signers of the declaration of American independence. He was a native of New Jersey, in which colony and state he held many important offices, representing the state in congress, and in the commercial convention of 1786.

CLARK, ALONZO, a graduate of Williams college, and in medicine of the New York college of physicians and surgeons in 1835, in which institution he was professor of physiology and pathology, and of the practice of medicine. He has been president of the New York state medical society, and has been a leading hospital and general practitioner in New York city for many years.

CLARK, ALVAN, b. Mass., 1804; the son of a farmer, and a self-taught engraver, portrait-painter, and optician. His telescopes have won high reputation and the praise of astronomers in all countries. He is the inventor of a double eye-piece, an ingenious method of measuring celestial arcs of from three to sixty seconds. In 1863, with one of his own telescopes he discovered a new star near Sirius, in honor of which the French academy of sciences awarded to him the Lalande prize.

CLARK, DAVIS WASGATT, D.D., 1812–71; a native of Maine, graduated at Wesleyan university in 1836, and for seven years presided over the Amenia seminary. In 1852, he was editor of the *Ladies' Repository*, and of the works issued by the western Methodist book concern. In 1864, he was elected bishop of the Methodist Episcopal church. He published *Treatise on Mental Discipline; Fireside Readings; Life and Times of Bishop Hedding; Man Immortal; Sermons;* etc.

CLARK, Sir JAMES, Bart., a distinguished physician, was born at Cullen, Banffshire, Dec., 1788. His early education was obtained at the grammar-school of Fordyce; and he afterwards passed to King's college, Aberdeen, where he took the degree of M.A. He studied medicine at Edinburgh and London, and entered as a navy surgeon in 1809—a position he held until 1815. Taking his degree of M.D. in Edinburgh in 1817, he, after traveling on the continent, settled at Rome, where he practiced as a physician for eight years. In 1826, he took up his residence in London, where he soon secured for himself a prominent place among the most eminent medical men of the time. On the accession of queen Victoria to the throne, C., who for two years previously had acted as physician to the duchess of Kent, was appointed physician in ordinary to her majesty; and in that capacity he attended the queen on most of her journeys to Scotland and the continent. He was created a baronet in 1838. Among the most important of C.'s contributions to medical science, is his work *On the Sanative Influence of Climate*, a subject upon which he was considered a high authority; and *A Treatise on Pulmonary Consumption*, in which he showed that this destructive malady is one of the general health, depending upon mal-assimilation of the food, and to be prevented, and in certain cases arrested, by a wise regulation of food, air, and exercise. He was among the first in his profession, along with Dr. Andrew Combe and sir John Forbes, who demonstrated the importance of the study of the laws of health, in order to the salutary direction and control of morbid action in disease; and he did great public and professional good by

inculcating attention to the powers of recovery inherent in all living organisms. C. edited the last edition of Dr. Combe's *Management of Infancy*. He died June 29, 1870.

CLARK, JONAS, 1730–1805; a graduate of Harvard in 1752, and pastor at Lexington, Mass. It was near his residence that the first blood of the revolution was shed. The next year he preached an anniversary sermon on the battle.

CLARK, LEWIS GAYLORD, 1810–73; for 25 years the editor of the *Knickerbocker Magazine*, a monthly publication in New York city. He was the twin brother of Willis Gaylord, who wrote the *Ollapodiana* for the *Knickerbocker*, and at the time of his death (1841) was the editor of the *Philadelphia Gazette*.

CLARK, THOMAS, 1801–67; a Scotch chemist, and lecturer on chemistry, in the Glasgow mechanics institution. He was apothecary to the Glasgow infirmary, and in 1833 was professor of chemistry in Marischal college, Aberdeen. He made many valuable discoveries in chemical science.

CLARK, THOMAS MARCH, D.D., LL.D., b. Mass., 1812; graduate of Yale, in 1831; studied theology at Princeton, and was licensed to preach in 1835. In 1836, he became an Episcopalian, and was made rector of Grace church, Boston. In 1843, he went to Philadelphia, but returned to Boston four years later. In 1854, he was consecrated bishop of Rhode Island. He has published *Early Discipline and Culture* and *Primary Truths of Religion*.

CLARKE, a co. in s.w. Alabama, between the Tombigbee and Alabama rivers; 1270 sq.m.; pop. '80, 17,806—10,090 colored. The surface is uneven, and much of it is covered with pine forests. Corn and cotton are the leading productions. Co. seat, Clarksville.

CLARKE, a co. in s.w. Arkansas, on the Washita and Little Missouri rivers, 941 sq.m.; pop. '80, 15,771—5,205 colored. The chief productions are corn and cotton. Co. seat, Arkadelphia.

CLARKE, a co. in n.e. central Georgia, on the Oconee river and its branches, reached by the Athens branch of the Georgia railroad. The land is poor, except near the streams. Productions; wheat, corn, oats, cotton, etc. Gold, garnets, and tourmaline are found. Co. seat, Athens. Pop. '80, 11,702—6,394 colored.

CLARKE, a co. in s.e. Indiana, on the Ohio river, traversed by four or five railroads; 400 sq.m.; pop. '80, 28,638. The surface is level and the soil fertile. Iron, limestone, and hydraulic cement are found. Productions, wheat, corn, oats, potatoes, butter, wool, tobacco, and sorghum molasses. Co. seat, Charleston.

CLARKE, a co. in s.w. Iowa, traversed by the Burlington and Missouri River railroad. Drained by the e. fork of Grand, and Whitebreast, and South rivers; 432 sq.m.; pop. '80, 11,512. Surface mainly prairie, and soil good; products, wheat, corn, oats, butter, wool, etc. Co. seat, Osceola.

CLARKE, a co. in n.e. Missouri, on the Mississippi and Des Moines rivers; 516 sq.m.; pop. '80, 15,031. The surface is uneven, chiefly of fertile prairie lands, with forests of good timber. Productions almost entirely agricultural. Co. seat, Waterloo.

CLARKE, a co. in n. Virginia, on the West Virginia border, traversed by the Winchester, Potomac and Strasburg division of the Baltimore and Ohio railroad, and intersected by the Shenandoah river, 208 sq.m.; pop. '80, 7,682—2,562 colored. It is a hilly region, with fertile soil, producing wheat, corn, wool, etc. Co. seat, Berryville.

CLARKE, a co. in the s.w. part of Washington territory, bounded s. and w. by Columbia river, which separates it from Oregon; 1400 sq.m.; pop. '80, 5,490. The soil is fertile, and agriculture is the chief business. Co. seat, Fort Vancouver.

CLARKE, ADAM, LL.D., an eminent minister and scholar of the Wesleyan Methodists, was b. about 1762 in the north of Ireland. He studied at Kingswood, near Bristol, and at the age of twenty, became a preacher or evangelist, in which capacity he obtained a great name, and seems to have exercised a most beneficial influence. Although the office of a Wesleyan pastor is very unfavorable for the development of scholarly habits, C. contrived to find time for extensive study. His first work was a *Bibliographical Dictionary*, published in 1802. His attainments in oriental literature and Biblical knowledge procured for him the degree of LL.D. from St. Andrews university. The board of commissioners on the public records selected him to edit Rymer's *Fœdera*. He also edited and abridged several other works, but the great work of his life was his edition of the Holy Scriptures in English, illustrated with a commentary and critical notes, into which were compressed all the results of his varied reading. The first volume appeared in 1810, the eighth and last in 1826. C. died Aug. 26, 1832.

CLARKE, EDWARD DANIEL, known as a traveler and author, was b. at Willingdon, in Sussex, in 1769. He studied at Cambridge, and from 1790 to 1799 was employed as tutor and traveling-companion in several noblemen's families, and made the tour of Great Britain, France, Italy, Switzerland, and Germany. In 1799, he set out on an extensive tour with Mr. Cripps, a young man of fortune; they traversed Denmark, Norway, Sweden, Lapland, Finland, Russia, the country of the Don-Cossacks, Tartary, Asia Minor, Syria, Egypt, Greece, and did not return to England till 1802. In conse-

quence of his donations to the university of Cambridge, C. received the degree of LL.D. In 1807, he began a course of lectures on mineralogy, and the university established a professorship of that science in his favor. He presented to the library of Cambridge a number of valuable marbles collected during his travels; among others, the colossal statue of the Eleusinian Ceres, on which he wrote a treatise in 1803. England is also indebted to him for the possession of the famous sarcophagus with the inscription in three languages. On this he wrote a treatise: *The Tomb of Alexander, a Dissertation on the Sarcophagus brought from Alexandria, and now in the British Museum* (Lond. 1805). His "Travels," of which the first volume was published in 1810, and the fifth in 1819, were received with extraordinary favor. An additional volume, containing his *Travels through Denmark, Sweden, Lapland, Norway, Finland, and Russia*, was published after his death (Lond. 1823). A complete edition of his travels appeared in 11 vols. (Lond. 1819–24). The university of Cambridge purchased his Greek and oriental manuscripts, among which is the famous Codex of Plato, which C. discovered in the island of Patmos. C. died Mar. 9, 1822.

CLARKE, GEORGE ROGERS, 1752–1818; a native of Virginia, who served against Benedict Arnold in that colony in 1780. He was made a brig.gen. in 1781.

CLARKE, HENRY F., b. 1820; graduated at West Point in 1843. He served in the Mexican war, and was in ten battles; at Molino del Rey he was wounded. In the war of the rebellion he served in the commissary department, and was made brevet maj.gen.

CLARKE, JAMES FREEMAN, D.D., b. N. H., 1810; a graduate of Harvard, and of Cambridge divinity school; pastor of a Unitarian church in Louisville, Ky., then of the Church of the Disciples in Boston; and for many years one of the overseers of Harvard college. Besides a vast number of articles contributed to current journals and magazines, he has published *Theodore* (a translation from the German); *Campaign of* 1812; *Eleven Weeks in Europe; Christian Doctrine and Forgiveness; Service Book and Hymn Book for the Church of the Disciples; Memoirs of the Marchioness d'Ossoli; Christian Doctrine of Prayer; The Hour which Cometh and Now Is; Orthodoxy, its Truths and Errors; Steps of Belief; The Ten Great Religions; Common Sense in Religion*, etc.

CLARKE, JOHN, 1609–76; an English physician, who came to Massachusetts soon after the Plymouth settlement was effected. He was one of the friends of Ann Hutchinson, and with her was driven out of the colony. Roger Williams received him, and Clarke thus became one of the founders of Rhode Island. He founded in Newport (in 1638, some say; others, 1644) a Baptist church, which some believe to be the earliest in America of that denomination. He went with Williams to England in 1651, as an agent for the colony, and there published *Ill News from New England, or a Narrative of New England Persecution*. After spending 12 years in England, he procured a second charter for Rhode Island, which secured to every person at all times the right to follow his own judgment in matters of religious concern. On his return, he resumed the care of the Newport church, and kept the pulpit until his death.

CLARKE, MCDONALD, 1798–1842; known as the "mad poet." He was a native of Connecticut, but was for many years a conspicuous figure in New York city. His madness was never violent, nor of easy detection by strangers. It was a boundless egotism rather than lunacy. He believed himself to be a great poet, and wrote a few good lines amidst an ocean of trash. Some of his conceits were admirable, however, and such a striking figure as this, "Night drew her mantle o'er her breast, and pinned it with a star," will have long life. Personally, he was excessively formal and polite, and free from bad habits. Though always in the depths of poverty, he played the gentleman to the last. His death was peculiarly sad. He was arrested one night by a watchman, who did not know him, as a destitute vagrant, and locked in a cell. In the morning he was found dead, drowned by an overflow of water caused by neglecting to shut off the faucet.

CLARKE, MARY VICTORIA COWDEN, b. 1809; daughter of Vincent Novello, and sister of Clara Novello, the vocalist. She was the pupil and associate of Mary Lamb, and was familiar with the literary men and women of half a century ago. At the age of 19 she was married to Charles Cowden Clarke, and soon afterwards began the great work of her life, the *Concordance to Shakespeare*. This book cost her 16 years of almost uninterrupted labor. It was published in London in 1846. She afterwards published *The Adventures of Kit Bam, Mariner; The Girlhood of Shakespeare's Heroines; The Iron Cousin; World-noted Women; Portia, and other Stories of the Early Days of Shakespeare's Heroines*, etc.

CLARKE, Dr. SAMUEL, an eminent philosopher and theologian, was b. at Norwich, Oct. 11, 1675, and educated at Cambridge. The system of Descartes at that time held almost universal sway; but this failing to satisfy his mind, he adopted the views of his contemporary and friend, Newton. Along with philosophy, he pursued the study of theology and philology. He was some time chaplain to the bishop of Norwich, a promoter of science; he afterwards became chaplain to queen Anne, and in 1709, rector of St. James's. By his work on the Trinity (1712), in which he denied that that doctrine was held by the early church, he brought himself into considerable trouble. The convocation of bishops, who wished to avoid controversy, contented themselves with

an explanation, anything but satisfactory, and a promise from C. to be silent for the future on that subject. His views were of the kind known as *semi-Arian*. For the rest, C. was a vigorous antagonist of the freethinkers of his time; in opposition to Dodwell, he sought to demonstrate the immortality of the soul from the idea of an immaterial being. He died May 17, 1729. His most famous work is *Demonstration of the Being and Attributes of God* (Lond. 1705); connected with it in subject is his *Verity and Certitude of Natural and Revealed Religion* (Lond. 1705). At the instigation of the princess of Wales, who was inclined to the doctrines of Leibnitz, C. entered into a keen correspondence with that philosopher on space and time, and their relations to God, on moral freedom, etc. This correspondence was published under the title of *Collection of Papers which passed between Leibnitz and Clarke in the years* 1715 *and* 1716 (Lond. 1717). In his ethical disquisitions, he seeks to find a foundation for moral obligation in a peculiar principle, which he calls the *fitness of things*, or the relations of things established from eternity by God. He published a valuable edition of Cæsar (Lond. 1712); that of Homer (Lond. 1729–46) was completed by his son. A collected edition of his philosophical works appeared in 4 vols., Lond., 1738–42.

CLARKE, WILLIAM, 1770–1838; a native of Va., appointed by Jefferson second lieut. of artillery, and ordered to join the Rocky mountain expedition which left St. Louis in Mar., 1804. To Clarke's thorough knowledge of Indians and their habits the success of the expedition was mainly due. In 1813, he was appointed governor of Missouri, and held the office until the state organization was completed. In 1822, he was made superintendent of Indian affairs, which office he held until his death.

CLARKE'S FORK, or CLARKE'S RIVER, formed by the junction of Flathead and Bitter-root rivers, in Montana, and flowing n.w., joining the Columbia river almost exactly on the line between the United States and Canada; length, about 650 miles.

CLARKSON, THOMAS, an eminent philanthropist, the son of a clergyman, master of the free grammar school at Wisbeach, Cambridge, was b. in that town, Mar. 28, 1760. He studied at Cambridge university, and was led to become the promoter of the anti-slavery agitation in Great Britain by a Latin prize-essay which he wrote in 1785, on the question, "Is it right to make slaves of others against their will?" An English translation, on being published, had an extensive circulation, and C. resolved to devote his life to a crusade against African slavery. Associations were formed, and, besides visiting the principal towns of England, and even going to Paris, in the cause, C. published numerous essays, pamphlets, and reports on the subject. Mr. Wilberforce, M.P., whose co-operation C. had secured, took the lead in the anti-slavery agitation, and in 1787 brought the subject before parliament. On Mar. 25, 1807, the law for the suppression of th eslave-trade passed the legislature. and C. subsequently wrote a *History of the Rise, Progress, and Accomplishment of the Abolition of the African Slave-trade,* 2 vols. 8vo., 1808. On the formation of the anti-slavery society, in 1823, for the abolition of slavery in the West Indies, C. became one of its leading members, and saw the object of its efforts attained in 1833. He took an active part in other benevolent schemes, particularly in establishing institutions for seamen in seaport towns, similar to the sailors' homes. He was in deacon's orders in the church of England, but manifested great liking for the society of Friends, although he never joined them. He died Sept. 26, 1846.

CLARKSVILLE, a village in Montgomery co., Tenn., on the Cumberland river, and the Memphis and Louisville railroad, 48 m. n. of Nashville; pop. 3,200. It is a shipping point for tobacco, and the center of a large trade in that article.

CLARY, *Salvia sclarea,* a plant of the same genus with sage (q.v.), a native of Italy and other southern countries of Europe, and which has been cultivated in British gardens from a very early period for its aromatic and other properties. It is a biennial, about 2 ft. high, with clammy stem, large, heart-shaped, rough, and doubly crenate leaves, and whorls of pale-blue flowers in loose terminal spikes, with large colored bracteæ. The seed is generally sown in spring, and the plants flower in the second year. C. is antispasmodic and stimulating. It has an odor resembling that of balsam of tolu, and is used for seasoning soups, and in confectionery for flavoring. Its flowers are used for making a fermented wine, esteemed for its flavor.—A British species of *salvia* (*S. verbenaca*) is sometimes called wild clary.

CLASSICS. The term *classici* was originally applied to those citizens of Rome that belonged to the first and most influential of the six classes into which Servius Tullius divided the population. As early as the 2d c. after Christ, it is applied figuratively by Gellius to writers of the highest rank, and this mode of designation has since been very generally adopted both in literature and art. Most nations have had at some one time a more than usual outburst of literature, and they usually style this the classical period of their literature, and its most distinguished writers their classics. But as the great productions of the writers and artists of antiquity have continued to be looked upon by moderns as models of perfection, the word C. has come to designate, in a narrower sense, the best writers of Greece and Rome, and "classical" to mean much the same as "ancient."

CLASSIFICATION, the act of forming into a class or classes; a distribution into groups, such as classes, orders, families, etc., according to relations or affinities. Arti-

ficial C. is an arrangement based on principles adopted without reference to natural relations, or in ignorance of them. Natural C. is an exhibition of systematic order as found in nature.

CLASSIS, in the Reformed church of Holland (and thence brought to America) the name of an ecclesiastical body, corresponding to a presbytery. The C. hears appeals from the consistories, which are the official boards of local churches, and the synod hears appeals from the Classis. The C. also confirms and dissolves pastoral connections, ordains and deposes ministers, and sends delegates to the local and general synods.

CLATSOP, a co. in n.w. Oregon, on the Columbia river and the Pacific ocean; 1100 sq.m.; pop. '80, 7,222. The soil is good, and timber is abundant. Co. seat, Astoria.

CLAUDE, ST., a t. of France, in the department of Jura, romantically situated at the confluence of the Bienne and Tacon, 25 m. s. of Lons-le-Saulnier. The town originated in an abbey erected here in the 5th century. The abbey enjoyed extensive privileges, including a very oppressive one—viz., that a year's residence on the abbey-lands made a peasant a serf. Serfdom continued down to the revolution. St. C. has a fine cathedral, and manufactures of cotton and paper; and musical-boxes, snuff-boxes, toys, and fancy articles of horn, bone, etc., are largely made. Pop. '76, 6,632.

CLAUDE, JEAN, 1619–87; a French Protestant preacher and controvertist, professor of theology in the Protestant college at Nîmes. He had a long controversy with Bossuet and Arnauld concerning the eucharist. On the revocation of the edict of Nantes he fled to Holland, and preached at the Hague until his death.

CLAUDE LORRAINE (properly named CLAUDE GELÉE), a celebrated landscape-painter, was a native of Lorraine, and b. in 1600. A relative, who traveled as a lace-dealer, took C., when still a boy, to Italy, but deserted him in Rome. However, he soon found employment in grinding colors and doing other menial services for Agostino Tassi, a landscape-painter, from whom he gained some knowledge of art. He next studied under Godfrey Waals at Naples, and after some time spent in wandering through various portions of Europe, he finally settled at Rome in 1627. The demand for his pictures rapidly increased, and he received numerous commissions. C. died of gout in 1682.

C.'s landscapes are found in the chief galleries of Italy, France, Spain, and Germany, and in particular England, which, according to Dr. Waagen, contains 54 paintings by Claude. Four of his best works—the landscapes known as "Morning," "Noon," "Evening," and "Twilight"—are in the royal gallery at St. Petersburg. The painting on which C. himself set the highest value is the "Villa Madama." He kept it as a study, and refused to sell it, even when pope Clement IX. offered for it as much gold coin as would cover the canvas. As C.'s paintings have always commanded very high prices, many copies and imitations have been imposed on buyers. This was the case even during the artist's life-time; for he set high prices on his works. In order to stop the fraudulent trade carried on in his name, he collected the sketches of his pictures in 6 books, to which he gave the title *Libri Veritatis*. They are now in the library of the duke of Devonshire.

C. was an earnest, indefatigable student of nature, and possessed great invention. No one could paint with greater beauty, brilliancy, and truth the effects of sunlight at various hours of the day, of wind or foliage, the dewy moistness of morning shadows, or the magical blending of faint and ever-fainter hues in the far horizon of an Italian sky; but it has been affirmed—especially of late—that his conception is often artificial, conventional, and positively untrue, and it must certainly be admitted that his introduction of pseudo-Greek architecture into modern scenery is in the very worst taste. His figures are, in general, such inferior accessories, that he was wont to say he made no charge for them when he sold his pictures. In his private character, C. was amiable and very generous.

CLAUDET'S FORCIM'ETER, an instrument for ascertaining the coincidence or non-coincidence of the chemical and visual foci in portrait or landscape combinations of lenses. It consists of eight fans or equal segments of a circle, arranged spirally round a horizontal axis; they are white, and numbered from one to eight with black figures, and, when in use, are so placed as to be all seen together from the lens. The method usually adopted in testing a lens is to focus with great accuracy the fan numbered 4, and take a photograph of the instrument, in which, if No. 4 be the sharpest and best defined, it is a proof of the coincidence of the chemical with the visual focus; if, however, No. 3 should be sharper, the lens has been under-corrected; if No. 5, the lens has been over-corrected, in the former case, the lens must be turned more towards the ground glass, and in the latter further from the ground glass.

CLAUDIA'NAS, CLAUDIUS, a Latin poet of Alexandria, lived in the end of the 4th and beginning of the 5th century. He wrote first in Greek, which appears to have been his native tongue (though he was originally of Roman extraction); but, as Gibbon says, he "assumed in his mature age the familiar use and absolute command of the Latin language; soared above the heads of his feeble contemporaries; and placed himself, after an interval of 300 years, among the poets of ancient Rome." His poems brought him into such reputation that, at the request of the senate, the emperors Arcadius and

Honorius erected a statue in honor of him in the forum of Trajan. The productions of C. that have come down to us, consist of two epic poems, *The Rape of Proserpine*, and the incomplete *Battle of the Giants;* besides panegyrics on Honorius, idyls, epigrams, and occasional poems. C. displays a brilliant fancy, rich coloring, with variety and distinctness in his pictures; but he is often deficient in taste and gracefulness. A good edition of his works was published by Gesner (Leip. 1759), more recently by Doullay (Paris, 1836). An English translation was executed by A. Hawkins (Lond., 2 vols., 1817).

CLAU'DIUS I., TIBERIUS, a Roman emperor, the youngest son of Nero Claudius Drusus, step-son of the emperor Augustus, was b. at Lyon 10 B.C. He was naturally sickly and infirm, and his education was neglected, or left to be cared for by women and freedmen. His supposed imbecility saved him from the cruelty of Caligula; but C., in his privacy, had made considerable progress in the study of history, and wrote in Latin and Greek several extensive works now lost. After the assassination of Caligula, C. was found by the soldiers in a corner of the palace, where, in dread, he had concealed himself. The prætorians carried him forth, proclaimed him emperor, and compelled his recognition by the senate and many citizens who had hoped to restore the republic. By his payment of the troops, who had raised him to the throne, C. gave the first example of the baneful practice which subjected Rome to a military despotism under the succeeding emperors. The first acts of his reign seemed to give promise of mild and just government, but in the year 42, when a conspiracy against his life was detected, his timidity led him to yield himself entirely to the guidance of his infamous wife, Messalina, who, in concert with the freedmen Pallas and Narcissus, practiced cruelties and extortions without restraint. C. meanwhile lived in retirement, partly occupied in studies, and expended enormous sums in building, especially in the famous Aqua Claudia (Claudian aqueduct). This great work occupied 30,000 laborers during eleven years. Abroad, the armies of C. were victorious. Mauritania was made a Roman province, the conquest of Britain was commenced, and some progress was made in Germany. After the execution of Messalina, another woman equally vicious and more cruel, Agrippina (q.v.), married the emperor, and destroyed him by poison 54 A.D., in order to secure the succession of her son Nero. After his death, C. was deified.

CLAUDIUS, MARCUS AURELIUS GOTHICUS, the second of the Roman emperors named Claudius, b. in the first half of the 3d century. He had great military ability. Decius gave him command of an army, and Valerian appointed him general on the Illyrian frontier, and ruler of the provinces of the lower Danube. When Gallienus died, he was chosen emperor, it is said at his own request.

CLAUDIUS, MATTHIAS, 1743–1815; a German poet known also by the *nom de plume* of "Asmus." He wrote for the *Wandsbecker Bote* (a weekly publication), a great number of poems which suited the popular taste and were everywhere repeated and admired. In his later years, he became devout, and gave up light verses to translate the works of St. Martin and Fenelon. His most popular song is the Rhine-wine song, still often heard at festivals in Germany.

CLAUDIUS CÆCUS, APPIUS, of the 4th c. B.C.; a Roman patrician and author. While censor he achieved some radical constitutional changes. He filled senatorial vacancies with men of low birth, and when his nominations were rejected he continued, in defiance of long established custom, to hold his office, even although his colleague had resigned. He also held on to the censorship for five years in defiance of the law which limited the term to a year and a half. In many ways, he invaded the traditional rights of the patricians and elevated the lower classes. He built a road and an aqueduct and gave them his own name, a thing before unheard of; and these public works have kept his memory down to our times. In 307, he was elected consul, but his military triumphs were unimportant. He was blind and tottering with age when Cineas, the minister of Pyrrhus, king of Epirus, visited Rome to make a treaty; but the fiery eloquence of Claudius so discouraged Cineas that he quickly gave up the work, and the Romans forgot their recent misfortunes in the patriotic appeals of the aged consul.

CLAUDIUS CRASSUS, APPIUS. See APPIUS CLAUDIUS CRASSUS, *ante*.

CLAUSE. See DEED.

CLAUSEL, BERTRAND, a French marshal, was b. at Mirepoix, in the department of Ariège, Dec., 1772, and entered the army at an early age. He commanded a brigade in the Italian campaign of 1799; was made a general of division of the army of the north in 1802; and distinguished himself in the campaign of 1809 against Austria. The chief field of his fame, however, was Spain, where, after the battle of Salamanca, July 22, 1812, he succeeded Marmont in the command. He conducted the very difficult retreat from Portugal with the greatest circumspection, having to sustain a succession of battles. Although he had fought for Napoleon to the last, Louis XVIII., on his first restoration, named him inspector-general of infantry. When Napoleon again landed in France in 1815, C. immediately declared for him, was made a peer, and received the command of the army of the Pyrenees. On the return of the Bourbons, he was declared a traitor, but escaped to America; was condemned to death in his absence, but was subsequently permitted to return to France; and in 1830, after the July revolution, he

received the command of the troops in Algeria, and made a successful expedition over the Atlas range into the province of Titeri, for which he was made marshal of France. Some misunderstanding, however, soon led to his recall; but he was again appointed governor-general of Algeria in 1835. After the disasters that befell the French arms before Constantine in 1836, and which were attributed in great part to him, he returned to France and defended himself—though not quite successfully—both from the press and the tribune, against the attacks made upon him. C. died at Secourrieu (Haute Garonne), 21st April, 1842.

CLAUSEN, HENRIK NIKOLAI, b. 1793; a Danish statesman and theologian, professor of theology in the university of Copenhagen, editor of the *Periodical for Foreign Theological Literature*, and author of a number of religious works. He was president of the provincial diet in 1842–6, and two years later a member of the constituent assembly, and one of the privy council. He was also one of the signers of the Danish constitution. In 1851, he resigned from the cabinet, but retained his seat in the diet.

CLAUSENBURG. See KLAUSENBURG.

CLAUSEWITZ, KARL VON, 1780–1831; a Prussian soldier and author. In 1806, he was adjutant to prince Augustus, and was captured by the French. After the restoration of peace he acted as maj.gen. of staff, and as military instructor to the crown prince of Prussia, and to prince Frederick of the Netherlands. In the Prussian army he served with distinction; and in the campaign of 1813 he was a staff officer under Blücher. He wrote the history of that campaign. In 1818, he was made maj.gen. and director of the military academy, and in 1831, chief of the general staff of Gneisenau's army on the Polish frontier. His works are good authority on military science and history.

CLAUSIUS, RUDOLPH JULIUS EMANUEL, b. 1822; in 1855, professor in the polytechnic institute of Zurich; in 1867, professor in the university of Würzburg, and in 1869, professor at Bonn. His mathematical calculations based on the dynamical theory of heat, intended to show the scientific necessity of a Creator and the possibility of miracles, have attracted much attention.

CLAUSTHAL. See KLAUSTHAL.

CLAVAGEL'LA, or CLUB-SHELL, a genus of lamellibranchiate mollusks of the same family with aspergillum (q.v.), of which fossil species were first known to naturalists, but existing species have also been discovered. These mollusks inhabit holes, which they excavate for themselves in rocks or in masses of coral, and the ordinary form of the bivalve shell is curiously modified; one valve being fixed to the inner surface of the chamber in which the animal lives, and the other free and capable of motion on its hinge within that chamber, whilst the shelly substance of the fixed valve is continued without interruption into a tube extending from the chamber outwards. The young mollusk is supposed to make its way into the rock by excavating this tube, but whether its excavations are accomplished by mere mechanical means, or by the aid of some chemical solvent, is still uncertain.—Fossil *clavagellæ* have not been found in any strata older than the supracretaceous group.

CLAVA'RIA, a genus of *fungi* of the division *hymenomycetes*, subdivision *clavati*. The spores are produced equally on all parts of the surface. The species are numerous, some of them simple and club-shaped, some branched. Some are natives of Britain. *C. botrytis*, a species common in oak and beech woods in Germany, growing on the ground among moss, grass, heath, etc., is gathered when young, and used as food, having a very agreeable sweetish taste. It ceases to be edible when it becomes old. Another German species, *C. flava*, which grows on sandy ground in fir-woods, is used in the same way. Other species appear to possess similar properties, and Liebig found them to contain the saccharine substance called mannite. *C. botrytis* is the *keulenpilz*, and *C. flava* the *ziegenbart* (goat's beard) of the Germans.

CLAVERACK, a village and township in Columbia co., N. Y., on the Hudson and Chatham railroad, 4 m. s.e. of Hudson; pop. '75, 3,817. Among the public institutions are the Hudson river collegiate institute and the Claverack academy. There are a number of important manufactories in the township.

CLAVICLE, or COLLAR-BONE, a bone which, in conjunction with the scapula (q.v.) or blade-bone, forms the shoulder. It derives its name from the Latin word *clavis*, in consequence of its resemblance to the key used by the Romans. As reference to the figure shows, it is placed horizontally at the upper and lateral part of the thorax, immediately above the first rib, and it articulates internally with the upper border of the sternum (q.v.) or breast-bone, and externally with the acromion process (or highest point) of the scapula.

Its chief office is to keep the shoulders well separated and steady, and to afford a fulcrum by which the muscles (the deltoid and great pectoral) are enabled to give lateral movement to the arm. Accordingly, it is absent in those animals in which the movement of the fore-limbs is only backwards and forwards (in one plane) for the purpose of progression, as in the pachydermata, ruminantia, and solidungula; while it is present in all quadrumana and in those of the rodentia in which the anterior extremities are used for prehension as well as motion, as the rat, squirrel, and rabbit; and in the

cheiroptera and insectivora, as the bat, mole, and hedgehog. In the mole it occurs in the form of a cube, being very short and broad, and of extreme length. In many of the carnivora (the cat, for example), the C. is present in the rudimentary form of a small bone suspended (like the hyoid bone in the neck) amongst muscles, and not connected either with the sternum or with the scapula. In birds, where great resistance is required to counteract the tendency of the enormous pectoral muscles to approximate the shoulders, the clavicles are large and united at an angle in the median line (just above the anterior end of the sternum) into a single bone, anatomically known as the "furculum," but popularly recognized as "the merry-thought." In this class of animals, additional, and even more efficient, support to the anterior extremity is afforded by the extension of the coracoid process of the scapula into a broad thick bone called the "coracoid bone" (q.v.), which extends to the sternum. It is unnecessary to trace the various modifications which this bone presents in reptiles and certain fishes.

In the human subject, the C. being exposed to the full force of blows or falls upon the shoulder, and not being easily dislocated (in consequence of its being well secured at both ends), is very frequently broken.

Ossification takes place in the C. earlier than in any other bone, commencing as early as the 30th day after conception, according to Beclard; and at birth it is ossified in nearly its whole extent. Mr. Humphrey (in his admirable *Treatise on the Human Skeleton*) suggests that the early ossification of this bone is a provision on the part of nature to prevent it from being fractured at birth in case of difficult labor.

Much important anatomical and physiological matter in connection with this bone will be found in Humphrey's work above cited, and in a memoir which he has recently published in the transactions of the Cambridge philosophical society; in Owen, *On the Nature of Limbs;* and in Struthers, *Osteological Memoirs, No.* 1, *The Clavicle.*

CLAVICOR'NĒS (Lat. club-horned), a great family of coleopterous insects, of the section *pentamera,* distinguished by the club-shaped termination of the antennæ, which are longer than the maxillary palpi. Most of the beetles of this family feed on animal substances, and many of them, and particularly their larvæ, find their appropriate food in substances undergoing decay. It contains many genera, divided into groups (tribes), *histeroides, silphales, dermestini,* etc. Burying beetles and the bacon beetle may be mentioned as examples of it.

CLAVIGE'RO, Francesco Saverio, a Mexican historian, was b. in Vera Cruz, South America, about 1720, and entering the order of the Jesuits, was educated as an ecclesiastic. Sent as a missionary among the Indians in various parts of Mexico, he lived among them for 36 years, and made himself fully acquainted with the languages, traditions, and antiquities of the aboriginal tribes. On the suppression of the Jesuits in South America by Spain, in 1767, C. sailed for Italy, and with others of his brethren had the town of Cesena assigned to them by the pope as a place of residence, where he died Oct., 1793. He wrote in Italian a *History of Mexico,* a comprehensive and valuable work, of which an English translation by C. Cullen was published in 1787, in 2 vols. 4to.

CLAY (Ang.-Sax. *clæg;* of the same root as *clag, claggy*), a term applied, in a vague way, to those kinds of earth or soil which, when moist, have a notable degree of tenacity and plasticity. The clays are not easily distinguishable as mineral species, but they all appear to owe their origin to the decomposition of other minerals, and to consist chiefly of alumina in combination with silica and with a certain amount of water. See Alumina, Shale, Loam, Pipe-clay, Kaolin, etc. Common C., when, from the large proportion of alumina which it contains, it is sufficiently plastic, is of great use for making bricks (q.v.), tiles, etc.

C. is used by sculptors and others engaged in the production of works of plastic art, as a means of adjusting the form which is to be given to their work, in the harder or more enduring substance of which it is ultimately to be composed. As modeling C. is apt to crack in drying, it must be kept damp by sprinkling water over it, and covering it with a wet cloth when the artist is not engaged in his work.

Clay Soils derive their character from the alumina which they contain in a state of mixture, as well as in chemical combination with other substances. Some soils contain as large a proportion of alumina as 40 per cent, but generally the proportion is much smaller. The feldspar which chiefly yields the alumina of clay soils contains also soda and potash, substances essential to vegetables, and which tend to render clays fertile when under cultivation. The physical characters, however, of the different varieties of clay soils arising from the varying proportions of silica, and other substances mixed with the alumina, are chiefly concerned in their relative fertility. Calcareous matter exercises a considerable influence on their powers of producing crops.

In Scotland, clay soils are chiefly found on the coal-measures, the bowlder-clay, and as alluvium in the valleys. Those derived from the coal-measures are generally unkindly, being tenacious and difficult to labor. In the eastern counties, these are usually farmed on a five or six course shift, according to their quality. In the western, the moister climate is less suited for cultivating them to advantage, and dairy husbandry usually prevails where they are found under culture. The clay soils derived from the bowlder-clays are also generally coarse and inferior in quality. The richest clay soils are found along the margins of the rivers, and go under the name of *carse* clays, which have already

been described under that head. In the n. of England, the aluminous shales of the coal-measures yield soils very similar in their properties to those in Scotland. England also abounds in clay soils derived from other geological formations. The chief of these are the London, plastic, weald, Gault, and blue lias clays. The stubborn character of many of them is such that they are not suitable for tillage, but form excellent meadows and pastures. In the dry climate of Suffolk, strong clays are cultivated with great success on the four-course shift.—1. Seeds; 2. Wheat; 3. Fallow or roots; 4. Barley. Thorough drainage has greatly increased the value of clay soils under cultivation. Being so much sooner dry in spring, a longer period is obtained for preparing the land for putting in the crops. Weeds, too, are much more easily extirpated, and the strength of the soil is more entirely directed towards the raising of the crops. Wheat, beans, and clover are the crops which clay soils carry in greatest perfection. Clay soils have been long known to be retentive of moisture as well as of manure. Recent chemical investigations have shown, that clay soils have remarkable powers for absorbing ammonia, potash, and other substances, which constitute the food of plants. This property, it is now pretty well ascertained, arises from surface attraction.

CLAY, a co. in e. Alabama, on the tributaries of the Tallapoosa and Coosa rivers; 700 sq.m.; pop. '80, 12,938—1067 colored. It has a good soil for agriculture; products are wheat, corn, oats, cotton, butter, etc. Co. seat, Ashland.

CLAY, a co. in s.e. Dakota, on the Nebraska border, intersected by Vermilion river, and the Dakota Southern, Sioux City, and Pembina railroad; 500 sq.m.; pop. '80, 5,001. The chief business is agriculture. Co. seat, Vermilion.

CLAY, a co. in n.e. Florida, bounded on the e. by St. John's river, and reached in its n.w. corner by the Florida railroad; 430 sq.m.; pop. '80, 2,838—573 colored. It has a level surface; and produces corn, cotton, sweet potatoes, and molasses. Co. seat, Green Cove Springs.

CLAY, a co. in s.w. Ga., bordering on Alabama, intersected by the Fort Gaines branch of the Southwestern railroad; 200 sq.m.; pop. '80, 6,650—3,852 colored. The surface is level; the soil fertile, producing corn, cotton, etc. Co. seat, Fort Gaines.

CLAY, a co. in s.e. Illinois, on the Little Wabash river, intersected by the Springfield and Illinois Southern and the Ohio and Mississippi railroads; 440 sq.m.; pop. '80, 16,195. Surface, prairie and forest; productions, wheat, corn, oats, butter, honey, sorghum molasses, etc. Co. seat, Louisville.

CLAY, a co. in s.w. Indiana, on Eel river, crossed by the St. Louis, Vandalia, Terre Haute, and Indianapolis railroad, and the Wabash and Erie canal; 360 sq.m.; pop. '70, 19,084; in '80, 25,853. It has a level surface, with beds of coal and iron ore. The chief productions are agricultural. Co. seat, Bowling Green.

CLAY, a co. in n.w. Iowa, on the Little Sioux and its tributaries; 700 sq.m.; pop. '80, 4,248. Productions agricultural. Co. seat, Peterson.

CLAY, a co. in e. Kansas, intersected by Republican river; 660 sq.m.; pop. '80, 12,320. Agriculture is the principal business. Co. seat, Clay Centre.

CLAY, a co. in s.e. Kentucky, on the headwaters of Kentucky river; 870 sq.m.; pop. '80, 10,222—706 colored. It has a mountainous surface, and fertile soil, producing corn, oats, wool, tobacco, etc. One of the principal industries is the manufacture of salt. Co. seat, Manchester.

CLAY, a co. in n.w. Minnesota, bounded on the w. by the Red River of the North, and crossed by the Northern Pacific railroad; 380 sq.m.; pop. 80, 5,886. There is no considerable settlement in the county.

CLAY, a co. in w. Missouri, bounded on the s. by the Missouri river, and crossed by a branch of the Hannibal and St. Joseph railroad; 415 sq.m.; pop. '80, 15,579—1513 colored. Surface uneven, and soil fertile, producing the usual agricultural crops. Co. seat, Liberty.

CLAY, a co. in s.e. Nebraska, on Little and Big Blue rivers; 576 sq.m.; pop. '80, 11,294. It has an undulating surface, and fertile soil.

CLAY, a co. in n.w. North Carolina, on the Georgia border, watered by the head streams of the Hiawasse river; 200 sq.m.; pop. '80, 3,316—143 colored. Productions agricultural. Co. seat, Haysville.

CLAY, a co. in n. Tennesee, on the Kentucky border, intersected by the Cumberland river; 175 sq.m. Co. seat, Butler's Landing. This co. was organized after the census of 1870. Pop. '80, 6,987—399 colored.

CLAY, a co. in n.w. Texas, bordering on the Indian Territory and the Red river; 1100 sq.m. This co. is very little settled. Pop. '80, 5,045.

CLAY, a co. in central West Virginia, on Elk river; 400 sq.m.; pop. 80, 3,460. Agriculture is the chief business. Co. seat, Clay Court-house.

CLAY, Cassius M., a zealous abolitionist, b. in Ky., 1810, graduated at Yale College, 1832, and 3 years after was elected to the legislature of his native state. C. opposed the annexation of Texas, 1844; started *The True American*, a vigorous anti-

slavery paper, the following year; volunteered in the Mexican war, 1846; supported Mr. Lincoln in 1860; and in 1862 was appointed U. S. minister to Russia, a post he held till 1869.

CLAY, GREEN, 1757–1826; a native of Virginia, and a pioneer in Kentucky, where he was a land surveyor in early life. While the country belonged to Virginia he represented the Kentucky district in the Virginia legislature. He was in both the Virginia and Kentucky conventions for the ratification of the federal constitution. He was for several years in the Kentucky legislature, at one time speaker of the senate. In 1813, he led a force to the relief of gen. Harrison, who was besieged by the British at fort Meigs; and he defended that fort successfully against the British and Indians under gen. Proctor and the renowned Tecumseh.

CLAY, HENRY, an American statesman of some distinction, was b. April 12, 1777, in Hanover co., Va. He early devoted himself to the law, and fixing his residence at Lexington, Ky., soon obtained a lucrative practice and political influence enough to be elected to the state legislature. In 1806, he was elected to Congress, and again in 1809 he was chosen senator for a term of two years. In 1811, he was sent to the house of representatives, where he was immediately elected speaker. A strong advocate of nationality, he denounced the claims put forth by England as to right of search; he was a strenuous supporter of the war with that country, and in consequence was sent, in 1814, as one of the commissioners to sign the treaty of peace at Ghent, where his acuteness secured for America some advantages. On his return, he exerted all his talents in favor of the independence of South America, and labored hard to eradicate all European influence from the American continent. C., however, is best known as the author of the famous "Missouri compromise," restricting slavery to the states s. of 36° 30′ n. lat.; and also for the compromise of 1850, known as C.'s "omnibus" measure. He died June, 1852. C. had undoubted talents, but he was by no means a comprehensive statesman. He was by far too fertile in compromises to be the author of any measure conferring lasting benefit on his country. He was very popular during his life-time, and was two or three times proposed for the presidency, an honor, however, which he never succeeded in obtaining.

CLAY, HENRY (*ante*), was the son of a Baptist preacher in humble circumstances, who died when Henry was five years old. The mother married ten years later and went to Kentucky, leaving Henry (the fifth of seven children) a clerk in a store in Richmond, Va. When about 16 years old, Henry found a place as copyist in the office of the clerk of the court of chancery, and turned his attention to the law. He was licensed to practice when 20 years old, and, following his mother into the wild west, opened an office in Lexington. He won practice and political position very easily, and in 1806—a few months before he was eligible by age—he was chosen to fill a vacancy in the U. S. senate. His term ended with the session, but in that brief period he had foreshadowed his coming fame as the champion of internal improvements by the national government. The next year, he was elected to the state legislature and chosen speaker of the lower house. A proposition that each member of the legislature should clothe himself in home-made clothing provoked remark by Humphrey Marshall that it was the proposition of the demagogues. As an orator, he had immense power over his audiences, whether cultured or unrefined; and his eloquence is one of the traditions of the western states, and, indeed, of the whole country. He had a wonderful personal magnetism, which attracted to him an enthusiastic friendship.

CLAYBORNE, WILLIAM, an early English settler in Virginia, member of the council and secretary of the colony. He was for many years at war with the Maryland settlers on questions of territorial jurisdiction, and at one time forcibly took possession of Calvert's government. In 1651, the English council made him one of the commissioners for the reduction of Virginia to obedience to Cromwell's commonwealth, and he afterwards took part in bringing Maryland also into obedience. In the Bacon rebellion, he was one of the court-martial for the trial of the prisoners. His descendants are very numerous in Virginia.

CLAYMORE (meaning "the great sword"), the Gaelic name for a kind of sword at one time much used, but not so well known at present. It had a double-edged blade, about 43 in. long by 2 in. broad; its handle was often 12 in. long, and its weight 6 or 7 lbs.

CLAYTON, a co. in central Georgia, on Flint river, traversed by the Macon and Western, and the Atlanta and West Point railroads; 150 sq.m.; pop. '80, 8,028—3,089 colored. Productions, wheat, corn, cotton, etc. Co. seat, Jonesborough.

CLAYTON, a co. in n.e. Iowa, on the Mississippi river, intersected by the McGregor and Missouri River railroad; 760 sq.m.; pop. '80, 28,829. The surface is chiefly fertile prairie; and water power and timber are abundant. The chief productions are, wheat, corn, oats, barley, butter, and wool. Co. seat, Elkader.

CLAYTON, a village and t. in Jefferson co., N. Y., a port of entry on the river St. Lawrence, at the termination of the Utica and Black River railroad, 108 m. n. of Utica; pop. '75, 4,207. The village, 11 m. above Alexandria bay, is near the famous Thousand Islands of the St. Lawrence, with which it has connection by steamboat.

CLAYTON, JOHN, 1690—1773, a native of England who came to Virginia about 1705 and died there in 1773. He was educated for a physician, but gave his whole attention to botany, and sent to the royal society many papers on the flora of the American colonies.

CLAYTON, JOHN MIDDLETON, 1796–1856; a native of Delaware, a graduate at Yale in 1815, who became an eminent lawyer in his own state. He was for many years a member of the U. S. senate, in which he held a prominent position. In 1849, he was appointed secretary of state, in which office he was followed by Daniel Webster. In 1851, he was again sent to the senate, and was in office when he died. He was the negotiator on the part of the United States in 1850 of the treaty with England guaranteeing neutrality of interoceanic communication across Central America. This agreement was known as the Clayton-Bulwer treaty.

CLAYTONIA, or SPRING BEAUTY, a genus of plants of the order *portulacaceæ*, an early and brilliant spring flower in the United States, and naturalized in Europe. The two species are perennials, growing from tubers in moist places.

CLAZO'MENÆ, one of the twelve cities of Ionia. It was originally built on the Hermæan gulf, westward from Smyrna; but the inhabitants having, through fear of the Persians, fled to a neighboring islet, and Alexander the great having connected the islet with the mainland by a dike, the city subsequently extended over the peninsula thus formed. It is now called Vurla.

CLËAN'THES, a Stoic philosopher, b. at Assos, in Troas, about 300 B.C. His poverty was such, that he had to work all night at drawing water, in order to obtain money for his support, and to pay his class-fee while attending the lectures of Zeno. For nineteen years he listened patiently to the great Stoic, and, on his death, succeeded him in his school. He died of voluntary starvation when about 80 years old. C. differed, it is said, from the other Stoics, in regarding the sun as the governing principle of the world; but none of his writings are extant except a *Hymn to Zeus*, one of the purest and noblest pieces of poetry in the Greek language. It is an admirable union of religious feeling and philosophic thought, and impresses us very strongly in favor of the author, who, from all we can learn, was a man of stern and serious character. The *Hymn to Zeus* was published in Greek and German by Claudius (Göttingen, 1786), and re-edited by Merzdorf (Leip., 1835).

CLEAR, CAPE, a headland of Clear island, the most southerly extremity of Ireland, and locally belonging to Cork county. Cape C. is elevated more than 400 ft. above the sea, and has a light-house, lat. 51° 26′ n., long. 9° 29′ w., with a bright revolving light 455 ft. above the water-level.

CLEARANCE, in the mercantile marine, is a permission from the custom-house officers, or the emigration officers, or both, for the departure of a ship from a port, denoting that all the formalities have been observed, and all dues, etc., paid. If a foreign vessel, she must also be certified by the consul of the nation to which she belongs. Hence the expression *cleared out*, in reference to the departure of a particular ship.

CLEAR'CHUS, a Spartan commander of the 5th c. B.C. After serving in the Hellespont, and at the battle of Cyzicus, he became governor of Byzantium; but during his absence the town was surrendered and he was punished by a fine; after being sent into Thrace to protect the Greek colonies he was recalled by the Ephori, but he refused to obey, and made himself master of Byzantium. Being driven thence, he visited the court of Cyrus, for whom he levied a small army of Greek mercenaries and led them in the expedition of the Ten Thousand. He was the only Greek who knew the real intentions of Cyrus, and it was not until they had proceeded too far for him to retire with safety that he made known the object for which they had been collected. He commanded a division of his countrymen in the battle of Cunaxa, and led them on their difficult return journey until, being treacherously seized by Tissaphernes, he was sent to the court of Artaxerxes, where he was put to death.

CLEAR CREEK, a co. in n. Colorado, the center of the silver-mining region; 350 sq.m.; pop. '80, 7,846. The Medicine Bow mountains occupy a considerable part of the county. The soil in the valleys is good, and water-power is plentiful. Co. seat, Georgetown.

CLEARFIELD, a co. in w. Pennsylvania, intersected by the Susquehanna river and Clearfield creek, and reached by a branch of the Pennsylvania Central railroad; 1150 sq.m.; pop. '80, 43,407. The e. portion is rugged and mountainous, but in other parts there is some good land. Coal and iron are plentiful. Co. seat, Clearfield.

CLEARING-HOUSE, in banking. The business facilities afforded by bankers to their customers in collecting their bills, checks on other firms, and like obligations, early imposed the necessity for an organized form of interchange of such securities, which would at once save labor and curtail the amount of floating cash requisite to meet the settlements of the bankers if effected singly. This was first done by the clerks, when out collecting from the different banking-houses, meeting daily at the counter of one of the houses for the purpose; but about 1775, the building in Lombard street, known as the "Clearing-house," was set apart for it, under the direction of a committee delegated

by the different firms, and the immediate management of two paid inspectors. The arrangement of the establishment may be briefly described: From time to time during the day each firm transmits to the clearing-house checks and bills which are payable by other bankers for classification, taking account of the obligations coming against their firm, so that, at the close of the day, they are the better able to make up their private books. At 4 o'clock the accounts are closed; each bank has till 4.45 to decide whether it will honor the drafts upon it; and by half-past 5 the officials are able to learn that the several houses are agreed between themselves, who has to pay money and who has to receive, and how much, by making up an account of the form subjoined. It is made up as between the particular bank receiving it and the clearing-house representing every other bank with whom the former may have had any business on the day in question:

GLYN.

Debtors.	Balance.		Balance.	Creditors.
280,000	20,000	Barclay	.....	260,000
50,000	10,000	Bosanquet	.....	40,000
110,000	.....	Commercial	10,000	120,000
115,000	5,000	Currie	.....	110,000
50,000	5,000	Fuller	.....	45,000
100,000	10,000	Hanbury	.....	90,000
110,000	.....	Hankey	5,000	115,000
280,000	.....	Jones	20,000	300,000
150,000	.....	Lubbock	10,000	160,000
200,000	.....	Masterman	15,000	215,000
50,000	.....	Olding	5,000	55,000
65,000	5,000	Spooner	.....	60,000
165,000	5,000	Union	.....	160,000
	60,000		65,000	

The comparatively small balance thus exhibited, used to be settled by each banking-house which owed money sending down to the clearing-house the amount, and paying it, not to the officials there, but to any clerk whose house claimed a balance. But now, to avoid the risk of handling such a large amount of bank-notes, it is settled by means of a species of check on the bank of England appropriated to the purpose, and called *transfer tickets*, signed by each banking-house, and certified by an inspector of the clearing-house. A white one is used when the bank has to pay a balance to the clearing-house, and a green one when it has to receive a balance from it. By this means, transactions to the amount of several millions daily are settled without the intervention of a bank-note; and the importance of the arrangement may be assumed from the fact, stated in evidence before the House of Commons, that before the connection of the London and Westminster bank with the clearing-house, they were obliged to keep in hand £150,000 in notes for negotiating their exchanges.

CLEARING-HOUSE, in banking. In New York, Philadelphia, Chicago, Cincinnati, and other large cities of the United States, clearing-houses have been for several years in successful operation. Either a well-known bank or a special building is used for the purpose. The best equipped and most admirably arranged clearing-houses are those of New York and Philadelphia. The room for this business is provided with separate numbered desks for a representative of each bank, and a raised *dais* for the manager of the clearing-house. Each bank belonging to the system is represented by two clerks, one of whom takes his place at his special desk, and the other stands in front to act as messenger. Usually at 8.30 A.M., the clearing-house manager calls to order, and with the utmost regularity the business of the hour proceeds. The messenger receives from his clerk packages intended for other banks, and moving from left to right visits each desk, leaving with the entering clerk such matters as he may have for him, together with a complete list of his transactions. Should all be correct, the clerks then return to their respective banks with statements of debits or credits—which must be settled with the clearing-house on the same morning. Should any errors be discovered, the clerks are not allowed to leave the clearing-house until they have been rectified, and in some instances fines are imposed and collected from the banks represented by the offending clerk. Complete records of all business therein transacted are preserved at the clearing-house. Thus transactions which formerly required many hours, are completed in a few minutes at a great saving of expense. The amounts transferred in some of the clearing-houses represent many millions of dollars daily. The New York clearing association commenced its operations on Oct. 11, 1853, numbering as members 52 banks, representing a capital of $46,721,262.50. The number was soon reduced to 48 by the retirement and closing up of four, in consequence of their inability to meet its requirements, reducing the aggregate capital to $45,118,800. On the 1st of June, 1879, the association consisted of 59

members, including the assistant treasurer of the United States at New York. The aggregate capital of the banks of the city was $83,508,800, with a surplus of $27,264,100, a reduction of capital and surplus in less than six years of $36,934,000, caused, in the opinion of bankers, principally by unequal and excessive tax under both federal and state laws. The transactions of the first day, Oct. 11, 1853, amounted to $23,938,682.25. Total transactions since its organization to June 1, '79, amounted to $526,110,047,756.40, a daily average, during 25 years and 7¼ months, of $67,545,262.26. The highest daily average for any one year was for that ending Oct. 1, 1869, viz., $125,088,789.91. The total transactions for that year were $38,527,347,294.42. The total transactions for the year ending June 1, 1879, were $23,307,402,934.05, a daily average of $76,167,983.44. The largest amount for any one day during the year was $122,029,347, on Jan. 27, 1879, and for any one day since the organization of the association, $206,034,920.50, on Nov. 17, 1868. This was the day after the Black Friday famous for the collapse of the gigantic "corner" in gold. The largest balance paid to the clearing-house by any bank was $4,774,039.59, on April 5, 1872. The system in use by the New York clearing-house is so perfect that, of the enormous transactions made through it, no error or difference of any kind exists in any of its records; neither has any bank belonging to the association sustained any loss in its connection by the failure of any bank or otherwise, while a member. It has proved of great service during financial emergencies, notably in aiding and sustaining the United States government at the breaking out of the civil war; and during financial panics, especially that of 1873, when, by combining the resources of its members through the machinery of the clearing-house, they were enabled to greatly modify the dangers which so seriously threatened the whole country. Its operations amount to over 65 per cent of the total exchanges of the 23 clearing-houses of the United States, and consequently it represents in a measure the magnitude of the daily business of the country; while the fluctuations in its daily, monthly, and yearly transactions, as shown by its records, are of great value both to the merchant and financier. The clearing-house occupies a building owned by the association, and arranged with special reference to its requirements.

CLEARING-HOUSE, The Railway, is an association instituted to enable railway companies in England and Scotland, to carry on, without interruption, the through traffic in passengers, animals, minerals, and goods passing over different lines of railways, and to afford to the traffic the same facilities as if the different lines had belonged to one company. The arrangements are called "the clearing system," and are conducted by a committee appointed by the directors of the companies who are parties to it. The business is carried on in a building in Seymour street, London, adjoining the Euston station. The association is regulated by act of parliament, 13 and 14 Vict. 33 (25th June, 1850), called "The Railway Clearing Act, 1850." Any railway company may apply for admission to the system, and, on being accepted, becomes a party to it. The companies are each represented on the committee by a delegate. Ten delegates from a quorum. The committee holds stated meetings on the second Wednesday in Mar., June, Sept., and Dec. in every year, and at such other times as may be found necessary. The accounts of the clearing system, and the balances due to and from the several companies, are settled and adjusted by the secretary of the committee, with appeal to the committee, whose decision is final. The expenses are defrayed ratably by the companies. The clerks at stations of the various companies send abstracts of all traffic monthly. The collected passenger-tickets are also sent monthly. Number-men are employed by the clearing-house, who attend at each railway junction, and watch the arrival and departure of every train passing the junction. They note the number of every carriage, horse-box, wagon, van, and sheet or wagon-cover on the train going beyond the parent line, and also all damaged stock, and make weekly returns. The destination of each wagon is also noted. The returns from the companies' stations, together with those of the number-men, enable the accounts to be made up at the clearing-house, and, after examination, the companies are debited and credited, as the case may be. A debtor and creditor account is sent from the clearing-house monthly to each company, showing, on the one side, what the company has to receive from others as their proportion of through passenger-fares, through goods rates and mileage of carriages, wagons, and sheets, and, on the other side, what the company has to pay to others out of moneys drawn by them. The balance is struck, and, if against the company, a remittance must be made. If the balance is on passenger traffic or stock, it is due five days after the date of the clearing-house advice. The other balances must be paid within 23 days. Interest at the rate of 7 per cent per annum is charged on outstanding balances. The cost of maintaining the clearing-house, with its officers and numerous clerks and number-men, is apportioned amongst the respective companies—(1.) In proportion to the number of entries at the credit of each in the mileage account; (2.) In the ratio of the number of vehicles and sheets recorded by the number-men; and (3.) According to the time occupied on the accounts.

Regulations are published annually by the clearing-house in Jan., for the guidance of the different companies in connection with the system. These determine the principles of classification of goods, division of rates, terminal allowances, payment for loss or damage of goods, and other points. A committee of general managers is

appointed, whose duty it is to arbitrate on claims for damages to rolling-stock. A committee of goods' managers adjudicate cases of disputed liability which relate to goods' traffic. A committee of coaching superintendents perform a similar duty with reference to coaching or passenger traffic. The mileage of carriages is also regulated, being three-farthings per m. first-class, and a half-penny for second. A varying rate for wagons and sheets is allowed according to distance, the charge for distances under 150 m. being about one half-penny for box-wagons, $\frac{5}{8}$ of a penny for open wagons, and $\frac{1}{8}$ of a penny for sheets. If carriages are detained beyond one clear day, demurrage is charged at the rate of 10*s.* per day for first-class carriages, and 6*s.* for second-class. If wagons are detained beyond two clear days, 3*s.* a day is charged. Sheets, after two days, are charged 6*d.* for the first day, and 1*s.* per day after. The terminal allowances are 8*s.* 6*d.* per ton in London, and 4*s.* in the country for carted goods; 1*s.* 6*d.* per ton when not carted.

The number of companies parties to the clearing-system was recently between 90 and 100, and the amount of business of an intricate kind which was involved may be judged of from the foregoing particulars. In short, the clearing-house system of Great Britain is a vast organization, adapted, in an extraordinary degree, to save trouble in accounting, as well as to prevent petty disputes, among the individual companies concerned. The very circumstance of the great bulk of the used passenger-tickets in the kingdom being transmitted to a common center for adjustment as to the claims of one company against another, affords, in itself, a remarkable instance of an ingenious system for elaborating simplicity out of what would almost appear a commercial chaos.—There is a similar railway clearing-house system in Ireland, with headquarters in Dublin.

CLEARING-NUT, *Strychnos potatorum*, a small tree of the same genus with the nux vomica (q.v.), abundant in the forests of India, and of which the seeds are much used for clearing water. They are sold for this use in the bazaars, and travelers commonly carry some with them. These seeds being rubbed on the inside of a vessel, muddy water put into it quickly becomes clear, all impurities settling to the bottom. The tree has a deeply fissured; bark, ovate, smooth, and pointed leaves; and a shining, black, pulpy fruit, with only one seed. The wood is very hard, and is used for various purposes.

CLEAR LAKE, a body of water in Lake co., Cal., 112 m. n. of San Francisco. It is about 25 m. long by 2 to 6 m. wide, and is in a picturesque region.

CLEARNESS, a quality of art which is realized by a skillful arrangement of colors, tints, and tones. Where C. is to be obtained without sacrificing depth, a knowledge of *chiaroscuro* (q.v.) becomes indispensable.

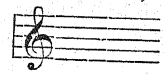
CLEAR-STORY, or CLERE-STORY. Originally this term was applied generally to the upper part of any building, which was lighted by several windows, or by a row of small windows or openings in the wall. Latterly, it came to be applied exclusively to the upper part of the central aisle of a church, in which windows were found above the roof of the side aisles. The object of the clear-story in churches appears to have been to increase the light in the nave, but the windows in our existing churches are generally so small as to effect this object very imperfectly. In many churches, the clear-story is a subsequent addition, and has often been added when the high-pitched roof, which included the side aisles in its span, gave place to a flat one covering the nave only. The walls over the arches of the nave were then raised so as to receive the clear-story windows.

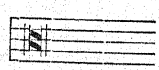
CLEATS, in ship-building, are pieces of wood fastened to various parts of the vessel, and having holes or recesses for fastening ropes. There are several kinds, applied to various purposes, and bearing the names of *belaying, comb, mast, shroud, single, stop, thumb*, etc., cleats.

CLEAVAGE, or SLATY CLEAVAGE, is a condition of rocks in which they split easily into thin plates. The direction of these laminæ may be in the plane of stratification, but it much more frequently differs from it. C. is the result of an operation which is subsequent to, and entirely independent of, the original stratification of the rocks. It is impossible to determine what is the producing cause of this phenomenon. By some it has been considered to be due to crystalline agency, while others maintain that it arises from the pressure of mechanical forces at right angles to the planes of C., and yet others seek an explanation in a combination of these two agencies. Prof. Sedgwick, who has carefully examined the phenomena of C., has arrived at the following general results: 1. That the strike of the C. planes, when they were well developed, and passed through well-defined mountain-ridges, was nearly coincident with the strike of the beds; 2. That the dip of these planes (whether in quantity or direction) was not regulated by the dip of the beds, inasmuch as the C. planes would often remain unchanged while they passed through beds that changed their prevailing dip, or were contorted; 3. That where the features of the country or the strike of the beds was ill defined, the state of the C. became also ill defined, so as sometimes to be inclined to the strike of the beds at a considerable angle; 4. Lastly, that in all cases where the C. planes were well developed among the finer slate-rocks, they had produced a new arrangement of the minutest particles of the beds through which they pass.

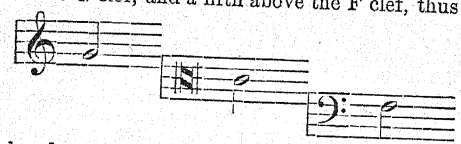
C., though generally confined to clay-slate, yet occasionally occurs in lime and sand-

stone; but in proportion as the rocks are coarse, the C. planes become fainter and wider apart. In the fine-grained clay-slate, on the other hand, the laminæ are thin, smooth, and parallel; and as C. is always accompanied with more or less induration in the rock where it exists, clay-slate, thus altered, is of great economic value for roofing.

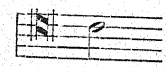




CLEAVELAND, a co. in s.w. North Carolina, on the South Carolina border, intersected by First Broad river, and a division of the Wilmington, Charlotte and Rutherford railroad; 660 sq.m.; pop. '80, 16,571—2,872 colored. The chief productions are agricultural. King's mountain is near the s.e. corner. Co. seat, Shelby.



CLEAVELAND, PARKER, LL.D., 1780–1858; a native of Massachusetts, graduated at Harvard, in 1799. In 1805, he was chosen professor of mathematics and natural philosophy, and lecturer on chemistry and mineralogy in Bowdoin college, a position which he retained until his death, although many professorships in other colleges and the presidency of his own were offered to him. His attention was devoted chiefly to mineralogy, in the interests of which he explored particularly the White mountains, and corresponded with many scientific men abroad. In the 53 years of his connection with the college he kept a meteorological journal, making three entries every day.



CLEAVERS, or GOOSE-GRASS, *Galium aparine*, a species of bedstraw (q.v.), a coarse annual, with whorls of 6 to 8 leaves, both stem and leaves rough with reflexed bristles, the fruit also hispid, and when ripe, very ready to adhere to any passenger who may brush against it; a very common weed in hedges and bushy places in Britain and most parts of Europe; but which has, from time to time, been brought into notice as possessing a remarkable specific power over some of the most formidable cutaneous diseases, including even lichen and leprosy, also over cancer. It is administered in the form of decoction or of extract. The whole subject of the properties of this herb seems to demand fuller examination.

CLEBURNE, a co. in n.e. Alabama, on the Georgia border, watered by the Tallapoosa, and intersected by the Selma, Rome and Dalton railroad; 700 sq.m.; pop. '80, 10,976—668 colored Surface uneven; productions mainly agricultural. Iron and lead are found. Co. seat, Edwardsville.

CLEEF, JAN VAN, 1646–1716; a Flemish painter whose works are found in many churches of Flanders and Brabant.

CLEF, a musical character placed on the staff, by which the names of the notes are fixed. There are three kinds of clefs—viz., the G, the C, and the F clef. The G clef is placed on the second line, thus:  ; the C clef on the third line, thus:  ; and the F clef on the fourth line, thus:  . The C clef is a fifth below the G clef, and a fifth above the F clef, thus:

The C clef is also placed on the fourth line for some instruments, and for the tenor part in vocal music, thus:  ; and in old vocal music, the C clef placed on the first line was used for the soprano.

CLEG, a name given to some insects of the dipterous family *tabanidæ*, the females of which are extremely troublesome to horses, cattle, and human beings in summer, piercing their skins by means of a curious apparatus of small lancets with which the mouth is furnished, and drinking their blood. The name C. is sometimes given in England to *chrysops cœcutiens*, a fly frequent in most parts of Europe, but rare in Scotland, and which not unfrequently inserts its proboscis through the sleeve, or some other part of the dress, and thus makes man himself the object of its attack. It is about one third of an inch in length, mostly black, with yellow markings on the abdomen, and very large eyes of the most beautiful green and golden colors. The insect always called C. in Scotland, is *hæmatopota pluvialis*—a rather smaller fly, mostly of a gray color, but also remarkable for its very large and beautiful eyes, which are greenish, with waved purplish-brown bands. In England, it is sometimes called the *stout*.

CLEMANGES, NICOLAS DE, 1360–94; one of the ablest Roman Catholic writers of the middle ages. He was educated in Paris, and studied theology under Pierre d'Ailly. He was chosen rector of the university of Paris in 1393, and esteemed the most eloquent member of that institution. Clemanges was an ardent advocate of reform in the church,

and labored with great pertinacity to heal the schism then existing, that of a double papacy, one at Rome and one at Avignon. His doctrines were much in advance of the age in many points. He placed the authority of general councils over that of the pope, and the authority of the Bible over that of general councils. He doubted whether at all former œcumenical councils the Holy Spirit really presided, as that Spirit would not assist men in pursuing secular aims. He wrote strongly against the immoral lives of the higher clergy, and recommended the teaching of the Bible as a remedy against wars and disturbances. In 1421, at Chartres, he defended the liberties of the Gallican church, and in 1425 he began to lecture on theology in the college of Navarre, continuing his duties as long as he lived.

CLEM'ATIS (Gr. *clēma*, the shoot of a vine), a genus of plants of the natural order *ranunculaceæ*, having four colored sepals, no corolla, and for fruit numerous one-seeded achænia with long—generally feathery—awns. The species are pretty numerous, herbs or shrubs, generally with climbing stems, natives of very different climates, and much scattered over the world. They possess more or less active caustic properties. The long awns give the plants a beautiful appearance even in winter. The flowers of many species are also beautiful. *C. vitalba*, the common TRAVELLER'S JOY (fancifully so named because of its ornamental appearance by the wayside), is the only native of Britain. It is common in the s., but becomes rarer towards the n., and is scarcely found in Scotland. The twigs are capable of being made into baskets. It rapidly covers walls or unsightly objects. The fruit and leaves are acrid and vesicant, the leaves are used as a rubefacient in rheumatism; and those of other species are also employed in the same way.—A number of species are commonly cultivated in our gardens. *C. flammula*, a native of the s. of Europe, and n. of Africa, with white flowers, which have a very strong honey-like smell, is the species known as sweet virgin's bower.

CLEMENS, SAMUEL LANGHORNE, b. in Missouri, 1835. He is known more generally by his adopted name of "Mark Twain." He learned the trade of a printer, and worked at the case in several western cities, and in Philadelphia and New York. In 1855, he made a voyage down the Mississippi, took a fancy to steamboat life, and learned the business of pilot. His next venture was in mining in Nevada; and in 1862 he became the local editor of the *Enterprise*, in Virginia City, where he remained three years, and began to use the name by which he is so well known This name is said to be the cry of the lookout on a river steamer, when he throws the lead, and finds the depth of water just two fathoms; "mark twain" signifies "at the mark of two fathoms." From Nevada, Clemens went to San Francisco and was for a time a reporter, and afterwards worked in the gold-diggings in Calaveras. In 1866, he spent several months in the Sandwich islands, and on return made a commencement as a lecturer. In 1867, he went with a pleasure party up the Mediterranean to Egypt and Palestine, and on his return described the journey in a serio-comic volume, "The Innocents Abroad." After editing a paper in Buffalo, and much lecturing all over the country, he married and settled in Hartford, Conn. His principal books, most of which enjoy remarkable popularity, are *The Jumping Frog, and Other Sketches; Roughing It;* and *The Innocents Abroad.*

CLEM'ENS, TITUS FLAVIUS, a celebrated father of the Christian church, was born probably at Athens, and resided during the greater part of his life in Alexandria, whence the epithet *Alexandrinus*. He flourished at the close of the 2d and the beginning of the 3d century. In his earlier years, he devoted himself with great zeal to the study of philosophy. His love of knowledge induced him to visit Greece, Italy, Syria, Palestine, and other countries. It is not known at what precise period he was converted from heathenism; but it is certain that after coming to Egypt, and listening to the prelections of Pantænus, he joined the Alexandrine church, and was made apresbyter. Afterwards he became assistant to his master, who held the office of *catechist*. In 202 A.D., the persecution of the Christians under Severus compelled him to flee to Palestine. He is supposed to have returned to Alexandria about 206, and in 211 succeeded Pantænus. The year of his death is differently stated; some writers think it probable he died 213 A.D.; others as late as 220. His most distinguished pupil was Origen.

C. was a very fertile writer. The chief productions of his which have survived are the *Protrepticus*, *Pædagogus*, and *Stromata*—which together form one large work. The first is an exhortation to the heathen to abandon idolatry; the second, an exposition of Christian ethics; and the third, a collection of treatises and brief observations on Greek and Christian literature. They show that C., when he became a Christian, did not cease to be a philosopher; instead of railing at science, he felt himself bound to make use of it, wherever it was helpful, in the elucidation of the higher questions of religion. Among the fathers, *Biblical criticism*, in the strict sense of the term, was unknown, and speculative philosophy was the only critical instrument in their possession. It is not to be wondered at, therefore, if much that is fantastic and absurd is to be found in their writings. C. certainly displays no lack of uncritical errors; but it is equally certain that the introduction of philosophy into Christianity helped to preserve the church from lapsing into the narrowness and ceremonialism of Jewish worship. The impression which we gather from C.'s writings, is that he was a man of broad, earnest sympathies, sincere piety, and liberal views in regard to the purposes of God's providence. This catholicity of mind procured him the accusation of heresy, and lost him the title of

saint. C. was also a writer of Christian hymns, one of which, addressed to the Redeemer, is preserved. His collective works were first published at Florence in 1550.

CLEMENS, or CLEMENT, is the name of 17 popes, few of whom require any special notice. See POPES. CLEMENS ROMANUS, probably the C. mentioned in the Epistle to the Philippians, is assumed as the first of the series. He is accounted one of the apostolic fathers. He is said to have died as bishop of the church in Rome, in the year 102. Of his two *Epistles to the Corinthians*, the first and longest is undoubtedly genuine. But the apostolic canons and constitutions attributed to him are spurious, as well as the fabulous account of his journeys with the apostle Peter. This last has come down to us in two forms: one in Greek, divided into 19 homilies, under the title of *Clementina;* the other, a Latin translation by Rufinus, entitled *Recognitiones Clementis.* The Epistles have been edited by Muralt (Zurich, 1848), the Homilies by Schwegler (Stutt, 1847), and the Recognitiones by Gersdorf, in his *Biblioth. Patr. Eccl.*, vol. i. (Leip. 1837).

CLEMENT II. (SUIDGER), a Saxon chancellor to the emperor Henry III. of Germany, who made him pope in Dec., 1046, on the abdication of Gregory VI. He died the next year.

CLEMENT III. (PAOLO OR PAULINO SCOLARI, bishop of Prænesle), elected pope 1187; d. 1191. He settled some of the troubles between the popes and the Roman people by permitting the latter to elect their magistrates, while the nomination of the governor of the city was left to the pope. He incited Philip Augustus and Henry II. of England to undertake the third crusade.

CLEMENT IV. (GUI FOULQUES, archbishop of Narbonne), chosen pope 1265; d. 1268. He had been secretary to Louis IX. of France, and when raised to the chair of St. Peter the papacy was at war with Manfred the Ghibelline usurper of Naples, and C. was compelled to enter Italy in disguise. He made an alliance with Charles of Anjou, the French pretender to the Neapolitan throne; Manfred was slain, and Charles formally established. C. is said to have disapproved of many of the harsh measures of Charles. He also encouraged and protected Roger Bacon.

CLEMENT V. (BERTRAND DE GOTH, archbishop of Bordeaux), chosen pope 1305 He removed the seat of the papacy to Avignon, and suppressed the order of templars. During his papacy, Henry VII. entered Italy, and was crowned in Rome by C.'s legate; but Henry died suddenly, leaving Italy in a condition of anarchy; the Roman barons were at the height of their dissension, and the Lateran palace was burned. C. suppressed in the bloodiest manner the heresy of Fra Dolcino, and died leaving a reputation disgraceful for nepotism, avarice, and cunning. He was the first pope to wear the triple crown. He died in 1314.

CLEMENT VI. (PIERRÉ ROGER, archbishop of Rouen), the fourth of the popes of Avignon, elected 1342; d. 1352. He was entirely under French influence, refused an invitation to return to Rome, and purchased the sovereignty of Avignon from Joanna, queen of Naples, agreeing to pay her 80,000 crowns. He never paid the money, but probably deemed that he had given its equivalent when he absolved the queen for the murder of her husband. He disputed with Edward III. of England concerning that monarch's encroachments upon ecclesiastical jurisdiction, excommunicated Louis of Bavaria, and made some negotiations for a reunion with the eastern church.

CLEMENT VII. (GIULIO DE MEDICI), elected pope 1523; d. 1534. His worldliness and lack of insight into the tendencies of the age disqualified him from comprehending the great religious movement which then convulsed the church, while his timidity and indecision no less disabled him from following a consistent policy in secular affairs. He was at first attached to the imperial interest, but by the overwhelming success of the emperor in the battle of Pavia was terrified into joining the other Italian princes in a league with France. But his zeal soon cooled, and by want of foresight and unreasonable economy he laid himself open to an attack from the turbulent Roman barons which obliged him to invoke the mediation of the emperor. When this danger seemed past, he veered back to his former engagements, and ended by drawing upon himself the host of the imperialist gen., the constable Bourbon, who led his army against Rome, and assaulted and sacked the city, May 5, 1527. The pope retired to the castle of San Angelo, and was there kept a prisoner for six months. He was released upon very onerous conditions, and for several years afterwards followed a policy of subserviency to the emperor, on the one hand endeavoring to induce him to act with severity against the Lutherans of Germany, and on the other striving to elude his demand for a general council. One consequence of this dependence on Charles V. was the breach with England occasioned by the pope's refusal to sanction Henry VIII.'s divorce from Catherine of Aragon.

CLEMENT VIII. (IPPOLITO ALDOBRANDINI), elected to the papacy 1592; d. 1605. He brought about the reconciliation of the church with Henry IV. of France; and to him Europe was indebted for the peace of Vervins (1598) which put an end to the long contest between France and Spain. He also annexed Ferrara to the states of the church, the last addition of importance to the pope's temporal dominion. The only serious stain upon his character was the execution of Giordano Bruno, Feb. 17, 1600.

CLEMENT IX. (GIULIO ROSPIGLIOSI), elected pope 1667; d. 1669. He adjusted the disputes between the Roman see and those prelates of the Gallican church who had refused to join in condemning the writings of Jansenius.

CLEMENT X. (EMILIO ALTIERI), chosen pope 1670; d. 1676. He was 80 years old when elected, and in consequence of infirmity he left the government to his nephew, cardinal Altieri, whose interference with the privilege of ambassadors occasioned disputes in which the pope was obliged to yield.

CLEMENT XI. GIOVANNI FRANCESCO ALBANI, elected pope 1700; d. 1721. The most memorable event of his rule was the publication in 1713 of the bull *Unigenitus*, which so greatly disturbed the peace of the Gallican church. By this famous document 101 propositions extracted from the works of Quesnel were condemned as heretical, and as identical with propositions already condemned in the writings of Jansenius. The resistance of many French ecclesiastics, and the refusal of French parliaments to register the bull, led to controversies extending through the greater part of the 18th century. Another important decision by this pope forbade the Jesuit missionaries to take part in idolatrous worship, or to accommodate Christian language to Pagan ideas under plea of conciliating the heathen.

CLEMENT XII. LORENZO CORSINI, pope from July, 1730, to Feb., 1740. He was the first pope to condemn the order of Freemasons.

CLEMENT XIII. CARLO REZZONICO, Bishop of Padua, chosen pope 1758; d. 1769, it was suspected from poison. In his time France, Spain, and Portugal urgently demanded the suppression of the Jesuits, but Clement warmly supported them. The pressure, however, became so strong that he was supposed to be about to give way, and had convoked a consistory, when he died very suddenly, and thus the Jesuits were saved for the time.

CLEMENT XIV., GIOVANNI VINCENZO ANTONIO GANGANELLI, was b. in 1705 at St. Arcangelo, near Rimini, where his father was a physician. At the age of 18, he entered the order of Minorites, and studied philosophy and theology, which he then successfully taught. His merits were appreciated by the keen-sighted Benedict XIV., who appointed him to the important post of counselor to the inquisition, and under Clement XIII. he was made a cardinal. On the death of Clement XIII., he succeeded to the papal chair, May 19, 1769. No pope had ever been elected under greater difficulties. The kings of Portugal, France, Spain, and Naples were at variance with C., chiefly on account of his support of the Jesuits; Venice wished to reform the religious orders without his interference; Poland was seeking to diminish his influence; the Romans themselves were discontented. C. first set about reconciling the monarchs; he sent a nuncio to Lisbon, suspended the bull *In Cœna Domini*, and entered into negotiations with Spain and France. After several years of negotiation, he issued, 1773, the famous brief *Dominus ac Redemptor noster*, suppressing "forever" the society of the Jesuits. The motive assigned in the brief is, "regard to the peace of the church." From this time his life was made miserable by constant fear, and his strength gradually gave way. He died of a scorbutic disease, Sept. 22, 1774. C. was remarkable for liberality of mind, address as a statesman, sound learning, and mildness of character. He cherished the arts and sciences, and was the founder of the Clementine museum, which, by the additions of Pius VI. and Pius VII., became the chief ornament of the Vatican.

CLÉMENT, JACQUES, 1565–89; a monk who was selected by the leader of the league for the assassination of Henry III. The day before the murder C. fasted, partaking only of the Lord's supper. In the morning, Aug. 1, 1589, he was admitted to the palace as the bearer of a letter, and while the king was reading it he stabbed him. Henry threw the knife into the assassin's face, exclaiming "Oh; the wicked monk! he has killed me! put him to death!" He was immediately killed, and his body quartered and burned. The king died the next day, and the murderer was declared a martyr by Bourgoing and other Roman Catholic prelates.

CLEMENT OF ALEXANDRIA. See CLEMENS, TITUS FLAVIUS, *ante*.

CLEMENTI, MUZIO, one of the best of pianists and composers for the pianoforte, was b. at Rome in 1750 or 1752. His skill on the pianoforte, when only 13 years of age, secured for him the notice of a Mr. Beckford, an English gentleman traveling in Italy, with whom C. went to England, and in whose family he remained for several years, studying the works of the great composers, and where he also acquired an extensive knowledge of literature. His "Opera 2" (composed in his 18th year) is considered the model on which the whole modern pianoforte sonatas have been founded. After traveling on the continent for some time, he returned to England, where he obtained the highest reputation as a teacher. Pecuniary misfortunes induced him, in the year 1800, to commence business as a music-seller and manufacturer of pianofortes. He died in London, Mar. 10, 1832. His compositions, mostly pianoforte sonatas, are full of pleasant melody, and arranged in masterly style. For students, his classical *Introduction to Pianoforte Playing*, and his last work, the *Gradus ad Parnassum*, have been highly recommended His style of playing was brilliant, and in improvisation he excelled all his predecessors.

CLEM'ENTINES, a collection of papal decrees and constitutions published by pope Clement V. in 1313. They constitute five books and 52 titles in the *Corpus Jurus Canonica.*

CLEOBU'LUS, one of the seven sages of Greece, the son of Evagoras, and a native of Lindus, over which town he was ruler. He was celebrated for strength and beauty of person, the wisdom of his sayings, the acuteness of his riddles, and the elegance of his lyrics. A letter of his inviting Solon to take refuge with him from Pisistratus indicates that C. was alive in 560 B.C. His son Cleobuline was quite as famous for riddles.

CLEOM'BROTUS I., a son of Pausanias, and king of Sparta in 380 B.C. He was the leader of the army on several expeditions, but without remarkable success. In 371 he went against the Thebans, but was disastrously defeated by Epaminondas. C. was mortally wounded in this battle, which took place at Leuctra.

CLEOME'DES, a Greek writer on astronomy. Nothing is known regarding his life, nor the period when he flourished. His treatise is entitled *The Circular Theory of the Heavenly Bodies,* and is remarkable as containing, amid much error and ignorance, several truths of modern science—such as the spherical shape of the earth, the revolution of the moon about its axis, its revolution round the earth, etc. C.'s treatise was first printed in Latin by Geo. Valla (Ven. 1498); in Greek, by Conrad Neobarius (Par. 1539). The two latest editions are those of Janus Bake (Lugd. Bat. 1820) and C. C. T. Schmidt (Leip. 1832).

CLEOM'ENES I., King of Sparta about 519 B.C. He led a Spartan force to Athens in 510 to aid in the expulsion of Hippias; and he was afterwards called in to support the Athenian oligarchical party led by Isagoras against the party of Clisthenes. On a technical charge of pollution, he banished 7,000 families, and established a new constitution, transferring the old senate to 300 of the oligarchical party. He was soon afterwards forced to leave the city. He made another unsuccessful attempt to sustain Isagoras. When the Ionian colonies revolted from Persia, their leader, Aristagoras, came to seek aid from Sparta, and tried to bribe Cleomenes to join him, offering higher and higher sums, until Cleomenes' daughter, Gorgo (afterwards the wife of Leonidas), eight or nine years old, said, "Father, go away, or the stranger will corrupt you." During a local war between Sparta and Argos, Cleomenes, by a stratagem, defeated the Argive forces near Tiryns. Those who escaped from the battle took refuge in a sacred grove, which Cleomenes ordered to be set on fire, and 6,000 of the flower of Argive citizens perished in the flames, a loss from which Argos was long in recovering. Another legend is that Argos was defended against Cleomenes by the women of the city. In the later years of his life C. became insane, and was kept in confinement; but he prevailed upon a slave to bring him a knife, with which he killed himself.

CLEOM'ENES III., the last king of Sparta of the Agidæ, came to the throne in 240 B.C. He desired to restore the old constitution and discipline of Lycurgus, and also to destroy the Achæan league. The league was defeated in a great battle at the foot of Mt. Lycæum. In Sparta, Cleomenes found active opponents in the ephors, but he crushed them by surrounding the hall in which they were feasting, and slaughtering them in a body. Then he established a new constitution, abolished the ephors, restoring the old prerogatives of the kings, making a re-distribution of lands, and extending the franchise. But in the war which ensued with the Achæan league he was defeated in the battle of Sellasia, 222 B.C., when the death-blow was given to the independence of Sparta. Cleomenes fled to Egypt, but came back some years later and headed an insurrection against the king. The plot failed, and Cleomenes committed suicide.

CLE'ON, a famous Athenian demagogue, who flourished during a part of the Peloponnesian war, was originally a tanner, but having a strong bias towards politics, he gradually abandoned his business, and became the champion of popular "rights." He first became prominent in the discussion regarding the fate of the Mytilenæan prisoners, 427 B.C. C. advocated the massacre of the males, carried his point, and more than 2,000 perished; the rest were saved through the remorse of the Athenians. In 425 B.C., along with Demosthenes, he commanded an expedition against the island of Sphacteria, which was garrisoned by the Lacedemonians, and, much to the surprise of every one, succeeded in reducing the place; but the whole merit of this deed is usually attributed to his colleague. C. himself, however, was highly elated with his success, and his countrymen, or, at least, many of them, appear to have fancied that he really possessed military genius, for in 422 B.C. he was sent to oppose Brasidas, the Spartan general, in Macedonia and Thrace. On his way thither, he took Torone, a town in which Brasidas had left a small garrison, and afterwards Galepsus. But the great design of the campaign was the capture of Amphipolis, where Brasidas was stationed. C. somewhat reluctantly advanced, and began to reconnoiter. While he was so doing, Brasidas made an unexpected sally, and in the battle which ensued both leaders were slain. The Athenian army, however, was defeated, and obliged to retreat. The general opinion of C. is not favorable. He is painted both by Thucydides and Aristophanes as an ignorant, vain, blustering, and cowardly *mobo-*

erat. Most modern historians have accepted this estimate of the man; but Grote, in his *History of Greece*, has thrown very considerable doubt on its truth, and has labored to show that he was the rough but resolute champion of the people, and that his character has been vilified and abused by Aristophanes, who was—there can be no doubt—violently aristocratic.

CLEOPA'TRA, the daughter of the Egyptian king, Ptolemy Auletes, was b. 69 B.C., and, according to the will of her father, should have inherited the throne along with her brother, Ptolemy Dionysus, who was also her husband. Her claim, however, being opposed, Julius Cæsar came to Alexandria, 48 B.C., to interpose in the quarrel, and in the Alexandrian war, Ptolemy Dionysus fell, and C., who was now married to her younger brother, Ptolemy, a boy of eleven years, was established upon the throne of Egypt. She bore a son to Cæsar, who was named Cæsarion. On her visiting Rome, Cæsar received her with great magnificence, and placed her statue in the temple which he had built to Venus Genitrix. In the civil war, after Cæsar's assassination, C. at first hesitated which side to take. After the battle of Philippi, Antony summoned her to appear before him at Tarsus, in Cilicia, to give account of her conduct. C., who had in the mean time got quit of the youthful Ptolemy by poison, appeared in the character of Venus Anadyomene, and so fascinated Antony, that he ever afterwards remained devoted to her. They spent the winter, 41–40 B.C., in Alexandria, in revelry; and Antony, although he had in the mean time married Octavia, the sister of Octavianus, returned to the embraces of C., who met him at Laodicea, in Syria, 36 B.C., and accompanied him to the Euphrates. His general residence from this time was with her at Alexandria. He bestowed upon her and upon her children great estates, which, however, he had no right so to dispose of. Upon this and other accounts, he became the object of great detestation at Rome, and war was declared against C., Antony being now regarded as her general. At her instigation, he risked the great naval battle of Actium (q.v.); and when she fled with 60 ships, he forgot everything else, and hastened after her. When Octavianus appeared before Alexandria, C. entered into private negotiations with him for her own security, which treachery becoming known to Antony, he vowed revenge; but a report coming to him that she had committed suicide, he thought it impossible to survive her, and fell upon his sword. Mortally wounded, and learning that the report which he had heard was false, he caused himself to be carried into her presence, and died in her arms. Octavianus, by artifice, succeeded in making her his prisoner. Failing to make any impression upon him, and finding that he spared her life only that she might grace his triumph at Rome, she took poison, or, as is said, killed herself by causing an asp to bite her arm. Her death took place in Aug., 30 B.C. Her body was buried beside that of Antony, and Octavia brought up the children whom she had born to Antony as if they had been her own.

CLEPSY'DRA, an ancient Greek musical instrument, described by Athenæus as having pipes which were made to produce a soft sound by the agitation of water forcing air into them. There were levers for admitting the water, thus forming a kind of hydraulic organ.

CLEPSYDRA (Gr. *klepto*, I conceal, *hydor*, water), an instrument for measuring time by the efflux of water through a small orifice. Two kinds have been in use—one wherein the fluid is simply allowed to escape through the orifice; the other, in which the uniformity of the flow is secured by maintaining the fluid at a constant level in the instrument. The first would, like a sand glass, give only an accurate measure of the time occupied in the escape of the whole fluid: of a shorter time, it would be an inaccurate measure, as the pressure under which the escape takes place at the commencement is greater than at any instant thereafter, and constantly diminishes with the height of the fluid column. In the second, the flow must be nearly uniform; and if the water be received into a uniform graduated tube as it escapes, we have a tolerably good clock. The rate of the flow, however, is affected by temperature and barometric pressure. The C. is supposed to have been used among the Chaldeans. The Romans employed it extensively. The invention of the pendulum has superseded it in modern times.

CLERC, JEAN LE, better known as JOHANNES CLERICUS, was b. at Geneva, Mar. 29, 1657, where his father was a clergyman. From an early period, he showed a particular aptitude for the study of ancient languages, and in this department he is still a conspicuous name. He also paid great attention to theology, and his numerous controversial writings brought him no mean reputation during his lifetime. Before he was 20, C. had imbibed heterodox opinions in religion. In 1678, he went as tutor to Grenoble, where he remained for two years; in 1680, he returned to Geneva, and was appointed to the clerical office. All the while, his objections to the accepted theology of the day had been growing; the works of Curcellæus and of Episcopius confirmed this antipathy, and now he appeared as Liberius de St. Amore, the writer of 11 letters against the errors of the scholastic theologians—in short, as the partisan of the Dutch remonstrants. In the latter part of 1681, C. left Saumur, whither he hand gone to perfect his French, and went to Grenoble, and thence to London, where he preached six months to the Savoy congregation. Finally, he was appointed professor of philosophy, classical literature, and Hebrew at the remonstrant seminary of Amsterdam. He died 8th Jan., 1736. C.'s writings are very numerous; but his greatest service to posterity

was the publication of a quarterly, the *Bibliothèque Universelle et Historique* (1686–93, 25 vols., in 8vo), followed up by the *Bibliothèque Choisie* (1703–13), and the *Bibliothèque Ancienne et Moderne* (1714–27). Other works of C.'s are—*Harmonia Evangelica* (1700); *Traduction du Nouveau Testament avec des Notes* (1703); *Ars Critica* (3 vols., 1712–30); and *Traité de l'Incrédulité* (1733). The first two are Socinian in their tendency. C.'s rationalism is still more manifest in a work entitled *Sentimens de quelques Théologiens de Hollande touchant l' Histoire Critique du Vieux Testament*, in which the special inspiration of the Scriptures is denied. His editions of several of the ancient classics prove both his learning and acumen.

CLERC, LAURENT, 1785–1869; b. France; he was a deaf mute, and without the sense of smelling, having when an infant fallen into a fire, seriously burning his face and head. He was taught in the institution for the deaf and dumb in Paris, becoming the favorite pupil of the abbe Sicard, and after eight years of study became himself a teacher. In 1816, he came to the United States with the Rev. Dr. Gallaudet, and the next year the two opened an institution for the deaf and dumb in Hartford, Conn. Clerc was a teacher of deaf mutes for more than half a century. At the age of 34, he married Miss Boardman, a deaf mute, who brought him several children, all of whom had the sense of hearing and could speak. His oldest son became an Episcopal clergyman.

CLERGY (Gr. *clēros*, a lot, an inheritance), a term very generally applied to the ministers of the Christian religion, in contradistinction to the *laity* (q.v.). This use of the term is very ancient, and appears to have gradually become prevalent, as the ministers of religion more and more exclusively, instead of the members of the Christian church equally, began to be regarded as God's "heritage" and "priesthood" (1 Pet. ii. 9, and v. 3), consecrated to him, and peculiarly his. The distinction between the C. and the laity became more marked through the multiplication of offices and titles among the C., the ascription to them of a place in the Christian church similar to that of the priests and Levites in the Jewish church, with peculiar rights and privileges, their assumption of a peculiar dress and of official insignia, the growth of monastic institutions, and the introduction of celibacy. In harmony with the notions on which this distinction is founded, is that of an indelible or almost indelible character derived from ordination, so that a renunciation of the clerical office is either viewed as an impossibility, or a sort of apostasy. These notions in their highest degree belong to the church of Rome. In the Protestant churches, the distinction between C. and laity is much less wide; and although the same terms are often used, it is rather conventionally than in their full signification. The employment of official robes by the C. preceded their assumption of a peculiar ordinary dress, and is not so intimately connected with any peculiar pretensions. Among the privileges accorded to the C. by the Roman emperors, and in the middle ages, was exemption from civil offices; among the rights asserted by them, and which caused much dispute, was exemption from lay jurisdiction, even in cases of felony. The C. were distinguished into the *higher C.* and the *lower C.*, the latter including janitors, acolytes, lectors, exorcists, etc. The term *secular C.* is the designation of priests of the church of Rome who are not of any religious order, but have the care of parishes. Monks who are in holy orders are designated *regular clergy*. See BENEFIT OF CLERGY.

CLERK, in the middle ages, designated an ecclesiastic—the term indicating a man of science or of learning—extended at a later period to mean a complimentary title for men of learning, whether of the church or not. In modern times it indicates any one who makes and keeps records, public or private; but in the law it is still an appellation of the clergy. In the United States there is an official clerk to each house of congress, and to each house of a state legislature; also there are county, city, and town clerks, and others of lesser importance. In the law, the clerk is an important officer of any court. In mercantile and other business life there are almost innumerable varieties of clerks.

CLERK, SHIP'S, is a civil officer on board a ship of war, under the immediate orders of the captain. He keeps all the captain's documents, which are very numerous; such as the ship's log, remarks on coasts and anchorages, the muster-book, etc.

CLERK, JOHN, of Eldin, Mid-Lothian, Scotland, inventor of the modern British system of breaking the enemy's line at sea, was the 6th son of sir John Clerk of Penicuick, bart. Though not a naval man, he studied deeply both the theory and practice of naval tactics, and in 1779 communicated to his friends a new maneuver for "breaking the enemy's line" in a naval battle. Visiting London the following year, he had some conferences on the subject with naval officers, among whom was sir Charles Douglas, lord Rodney's captain of the fleet in the memorable action of April 12, 1782, when the experiment was tried for the first time, and a decisive victory gained over the French. The principle was adopted by all British admirals, and led to many signal naval victories. In 1782, C. printed 50 copies of his *Essay on Naval Tactics*, for private distribution among his friends. It was reprinted and published in 1790; the 2d, 3d, and 4th parts were added in 1797; and the work was republished entire in 1804, with a preface explaining the origin of his discoveries. The maneuver was claimed by sir Howard

Douglas for his father, admiral sir Charles Douglas, but C.'s right to it is indisputable. He died May 10, 1812.—His son, JOHN CLERK (lord Eldin), an eminent Scottish judge, born in April, 1757, was educated for the profession of the law, and in 1785, was admitted advocate. Distinguished for great clearness of perception and admirable powers of reasoning, he had for many years the largest practice at the Scottish bar, and in 1823 was raised to the bench, when he assumed the judicial title of lord Eldin. He possessed a quaint sarcastic humor, and a coarse but ready wit, which, with his lameness and other bodily peculiarities, rendered him one of the most remarkable Edinburgh characters of his time. He died in that city in June, 1832.

CLERK, PARISH, an official in the church of England, who leads the responses in a congregation, and assists in the services of public worship, at funerals, etc., but is not in holy orders. There is usually one in each parish. In cathedrals and collegiate churches, there are several of these lay-clerks; and in some cases they form a corporate body, having a common estate, besides payments from the chapter. Before the reformation, the duties were always discharged by clergymen.

CLERK TO THE SIGNET. See WRITER TO THE SIGNET.

CLERMONT, a co. in s.w. Ohio, on the Ohio river, reached by the Marietta and Cincinnati, and the Cincinnati and Muskingum valley railroads; 462 sq.m.; pop. '70, 34,268. The soil is fertile; productions, wheat, corn, butter, wool, tobacco, etc. Co. seat, Batavia.

CLERMONT (in the middle ages, *Clarus Mons,* or *Clarimontium*) is the name of several towns in France. The most important is the capital of the department of Puy-de-Dôme, Clermont-Ferrand (the *Augustonemetum* of the Romans, in the country of the Arverni), which is finely situated on a gentle elevation between the rivers Bedat and Allier, at the foot of a range of extinct volcanoes, crowned by the peak of Puy-de-Dôme, about 5 m. distant from the town. It consists of the two towns of C. and Montferrand, upwards of a mile distant from one another, and connected by a fine avenue of trees. C. contains several remarkable buildings: the old Gothic cathedral, the corn and linen hall, the theater, and the hôtel-dieu, or hospital. C. has several educational and scientific institutions, and a public library, in which are preserved some curious MSS. Pop. '76, 37,074, who carry on the manufacture of linen, woolen cloth, hosiery, paper, etc., and an extensive traffic in the produce of the district, and in the transit trade between Paris and the s. of France. There are two mineral springs in the town, which are used for bathing. That of St. Alyre is most remarkable, having deposited in the course of ages an immense mass of limestone; and the deposit at one part forms over a rivulet a natural bridge 21 ft. long. The whole district abounds in such springs. A multitude of Roman antiquities attest the Roman origin of the city. In the middle ages, C. was the residence of the counts of the same name, and became the seat of one of the oldest bishopries of France. Several ecclesiastical councils were held here, the most remarkable of which was that in 1095, at which the first crusade was instituted by Urban II. A statue has been erected to Pascal, who was a native of Clermont.

CLERMONT-DE-LODEVE, a t. in the department of Herault, 23 m. w.n.w. of Montpellier, agreeably situated on the declivity of a hill, crowned by the ruins of an old castle. It has extensive manufactures of woolen cloth. Pop. '76, 5,685.

CLERMONT EN BEAUVOISIS (CLERMONT SUR OISE), a t. in France, 36 m. n. of Paris; pop. '72, 5,774. The town-hall, and church of St. Simon, date from the 13th c., and the hill on which the town is built is surmounted by an old castle of the 10th or 11th c., now transformed into a penitentiary for women. C. was an important post in the middle ages. It was frequently taken and retaken in the wars with the English, and in 1487 it was surrendered to them as a ransom for the French leader, La Hire. Cassini, the astronomer, was born here.

CLE'RUS, a genus of insects of the order *coleoptera,* section *pentamera,* and of the great family or sub-section *serricornes.* They are beautiful beetles, generally found on flowers, and often on those of umbelliferous plants, but their larvæ feed on the larvæ of different kinds of bees: those of *C. apiarius*—a rare insect in Britain, but common in some parts of Europe—on the larvæ of the hive-bee. It is about half an inch long, greenish, the wing-cases scarlet with purplish blue bands. How the larvæ of this and other insects should be able to carry on their ravages with impunity in a bee-hive, has never yet been satisfactorily explained.

CLÉRY, JEAN BAPTISTE, 1759–1809; one of the devoted friends of Louis XVI., and one of the few attendants permitted to share his prison. A few days before the king's execution Louis shared a loaf of bread with C., that being the only proof of regard he was able to show him. C. published an account of the king's imprisonment.

CLÉSINGER, JEAN BAPTISTE AUGUSTE, b. 1820; a French sculptor who first became noted by his bust of Scribe. Among a great many works from his chisel are "Girl Bitten by a Serpent," "Liberty," "Fraternity," "Gypsy Girl," "Cleopatra in the Presence of Cæsar," statues of Louise of Savoy and Sappho; equestrian statues of Francis I. and Napoleon I., for the Louvre; busts of Charlotte Corday, the emperor of

Russia, and the king of Prussia, for the Hotel de Ville. He married the daughter of the famous authoress, George Sand.

CLETHRA, a genus of shrubs of the order *ericaceæ*. It is the white alder or sweet pepperbush, found in all the states from Canada to the gulf. The flowers are white and fragrant.

CLEVELAND (Cliff-land), a wild mountainous district, with some picturesque fertile valleys, forming the e. part of the N. Riding of Yorkshire between Whitby and the Tees. Geologically, it consists of inferior oolite, but the coast and w. border are formed of lias. In the s. the hills rise 1300 to 1850 feet. An extraordinary change has been wrought in the aspect of the country by a rich discovery of ironstone in the C. hills; since 1851, lonely hamlets have become populous towns. The ironstone is chiefly an argillaceous carbonate, inferior in quality to the ironstone of the coal-measures. See MIDDLESBOROUGH.

CLEVELAND, next to Cincinnati the most commercial city in Ohio, stands on the s. shore of lake Erie, at the mouth of the Cuyahoga, in lat. 41° 30′ n., and long. 81° 47′ west. The harbor is one of the best on the coast; and has been rendered still more available by extending a pier on either side into deeper water. By means of this secure and commodious haven, C., with the aid of artificial works in both directions, has navigable communications with the Atlantic ocean on the one hand, and with the head of lake Superior on the other; while to the s. it connects itself with the basin of the Mississippi and the gulf of Mexico through a canal which enters the Ohio at Portsmouth, about 200 m. below Pittsburg. C. is also the terminus of railways converging from almost every quarter. With so many advantages in its favor, it could hardly fail to grow and prosper. It is celebrated for its ship-building, and is becoming rapidly more and more important for its manufactures. Among these are copper-smelting, iron-rolling, coal-oil refining, the making of iron from ore, nail manufactories, etc. In 1874, the imports and exports were valued at 1,876,108 dollars. C. was founded in 1796, but it does not appear to have attained anything like its present rate of progress before 1840. Between that year and 1850, the population increased from 6,071 to 17,034; in 1860, it was 43.147; in 1870, it was 92,829; and in 1875 it was above 150,000. Many of the streets of C. are lined with trees, whence it is called "Forest city." C. has numerous public schools, colleges, public buildings, charitable institutions, 100 churches, 50 newspapers and periodicals, etc. Magnificent works were erected at the cost of about 800,000 dollars, to supply the city with water from lake Erie.

CLEVELAND (*ante*), the second city of Ohio, on the southern shore of lake Erie, 170 m. w. of Buffalo, and 130 m. n. of Columbus, has grown to its present dimensions from a small town originally surveyed and settled in 1796 by gen. Moses Cleveland, one of the directors of the Connecticut land company, for whom it was named. It is the chief port of the "western reserve," and the capital of Cuyahoga county. It is divided into two parts connected with each other by bridges crossing the Cuyahoga river, which here empties into the lake. The harbor, which has been much improved by the national government, is one of the best on the lake. The most beautiful portion of the city lies upon a sandy bluff on the e. side of the river, from 60 to 150 ft. above the surface of the lake. The whole city is laid out with good taste, mostly in squares, the principal streets being from 80 to 120 ft. wide, and one having a width of 132 feet. Shade trees, the maple predominating, are so abundant that the place is properly called the "Forest city." Euclid avenue, lined with elegant private residences, each of which is surrounded with ample grounds, is acknowledged to be the handsomest street in the country. Superior street, having a width of 132 ft., is occupied by the banks and the fashionable retail stores. Monumental park, in the center of the city, with an area of ten acres, as originally laid out, is now crossed by streets at right angles, and so divided into four smaller squares, beautifully shaded and carefully kept. In one of these squares is a handsome fountain, in another a pool and a cascade, and a statue of commodore Perry, the hero of the battle of lake Erie, erected in 1860 at a cost of $8,000. West of the river is another finely shaded park, called the circle, with a beautiful fountain in the center. The city cemetery, on Erie street, contains many tasteful monuments; Woodlawn cemetery, on the eastern side of the city, is rich in monuments and statuary; Lake View cemetery, containing 300 acres, 5 m. from the city, is elevated 250 ft. above the level of the lake. Besides these there are the Roman Catholic and several smaller cemeteries. Water for the city is obtained by means of a tunnel under the lake, and is distributed from a reservoir on the highest elevation w. of the river. The principal public buildings are of stone, and present a fine appearance. The United States building contains the custom-house, post-office, and rooms for the federal courts. The co. court-house and city hall occupy conspicuous places, and are well adapted to their several uses. The house of correction is a large and handsome edifice, costing $170,000. The C. medical college is an imposing structure, and the city infirmary, five stories high, cost $25,000. The union railway station, a massive structure of stone, is one of the largest buildings of the kind in the world. The high schools and several of the churches are very handsome structures. The public library was opened in 1869 with 6,300 volumes, and contains 20,000 at the present time. It is supported by a tax of $\frac{1}{10}$ of a mill on the city valuation. The mercantile library has an endowment of $23,000,

and contains 10,500 volumes. There are several smaller libraries. Charity (St. Vincent's) hospital, opened in 1866, with a capacity for 200 patients, was built by private subscription. The city infirmary is maintained at an annual expense of $14,000. In connection therewith is a farm, the annual products of which amount to more than $10,000. The city hospital has no endowment, but enjoys an annual income of $7,000 from donations and the rental of its beds. The foundling hospital is supported in the same way. The homeopathic hospital, founded by the faculty of the C. homeopathic college, provides for the wants of an increasing number of patients. The United States marine hospital, for the benefit of sailors, is supported by appropriation from congress and a small tax on the sailors of the C. district. The house for the aged poor, founded 1870 by the "little sisters of the poor," is supported by private charity. The house for working-women, founded 1869, owns its buildings and grounds, but has no other endowment. The Protestant orphan asylum, chartered 1853, has an endowment of $50,000. St. Mary's female orphan asylum, founded 1851, and its tributary, St. Joseph, founded 1859, have but a small endowment. St. Vincent's male orphan asylum, founded 1852, has many inmates, but no endowment. Besides these, the Jewish orphan asylum, the Bethel home for the destitute, and the children's aid society, deserve mention as highly useful charities. The churches of the city number more than 100, 15 of which are Roman Catholic, and the rest divided in varying proportions between the several Protestant denominations. The Roman Catholics sustain two convents, and the evangelical Protestants a young men's Christian association. The public schools are well organized and efficiently managed. The seminary for women is a flourishing institution, so also is the union business college. The Roman Catholics have 11 academies and schools. The state law college has a library of 2,500 volumes and a considerable number of students. The C. medical college (attached to the university of Wooster) was organized in 1843, and graduates annually a large number of students. The homeopathic medical college, founded in 1849, is flourishing. C. contains 6 national banks, with an aggregate capital of more than $4,000,000, 2 savings banks, 9 insurance companies, 3 markets, and more than 30 hotels. Five or six great lines of railroad center here, and the Ohio canal connects lake Erie at this point with the Ohio river. It was this canal, completed in 1834, that first gave a great impetus to the commerce of the city. Seven street railway companies connect all parts of the city with one another. Numerous steamers ply between C. and all other ports on the lake. The manufacturing industries of the city are varied and extensive, and increasing with great rapidity. They embrace iron, coal, refined petroleum, sulphuric acid, wooden ware, agricultural implements, sewing machines, railroad cars, marble, white lead, etc. The capital invested in these and other manufactures is estimated at upwards of $20,000,000. In 1873, the wages paid to laborers in the more than 300 manufacturing establishments amounted to about $7,500,000. The assessed valuation of the city in 1873 was $65,000,000. The pop. of C. at different periods was as follows: 1810, 57; 1820, 350; 1830, 1000; 1840, 6,071; 1850, 17,034; 1860, 43,417; 1870, 93,018; 1880, 159,404.

CLEVELAND, Charles Dexter, 1802–69; a native of Massachusetts, graduated at Dartmouth in 1827; professor of Latin and Greek at Dickinson college, and of Latin in the university of the city of New York. In 1861, he was appointed U. S. consul at Cardiff, Wales. Among his publications are *The Moral Characters of Theophrastus; Compendium of Grecian Antiquities; Compendium of Grecian Literature; Hymns for Schools; English Literature of the Nineteenth Century; Compendium of American Literature; Compendium of Classical Literature;* and *Lyra Americana.*

CLEVENGER, Shobal Vail, 1812–43; a native of Ohio, who when young worked at stone-cutting, from which he rose to be a sculptor of more than ordinary merit. After making busts of Webster, Clay, and others, he went to Florence, and was rapidly advancing when consumption attacked him, and he died at sea on a homeward voyage.

CLEVES (Ger. *Kleve*), a t. of Rhenish Prussia, 48 m. n.w. of Düsseldorf. It is situated on three gentle elevations, about 2½ m. from the Rhine, with which it communicates by canal, in the midst of a rich and beautiful country. It is divided into an upper and a lower t., is well built, in the Dutch fashion, and surrounded by walls. It has a fine old castle, partly built on a commanding rock, in which Anne of Cleves, one of the wives of Henry VIII., was born, and which is now converted into public offices. In the collegiate church, which dates from the 14th c., are some good monuments to the counts of Cleves. C. has manufactures of woolen and cotton fabrics, silks, hosiery, tobacco, etc. Pop. '75. 9,248. C. was anciently the capital of a duchy extending along both banks of the Rhine, and which passed by marriage to the reigning house of Prussia.

CLEW is a name given to the lower corner of square sails, and the aftermost lower corner of stay-sails. *Clew-lines* are the names of ropes for managing these corners; *clew-garnets* are only applied to the *courses*, or largest sails of a ship; and to *clew-up*, is to haul up the C. of a sail.

CLEW BAY, an inlet of the Atlantic, on the w. coast of Mayo co., Ireland, 15 m. deep by 8 broad. Some of the mountains on the n. rise 1200 to 2500 ft., but the land on the e. is lower, and leads to Westport, Newport, and Castlebar. Old red sandstone,

carboniferous limestone, and Cambrian strata form the shores of the bay, which are generally bold and rocky, but have many small harbors and fishing-stations. The upper part of the bay contains an archipelago, 300 fertile and cultivated islets. At the entrance of the bay is Clare isle, 4½ by 2 m., composed of old red sandstone and Cambrian rocks, and rising 1520 feet.

CLICHÉ (Fr.), the impression made by a die in melted tin, or other fusible metal. It is the proof of a medalist's or die-sinker's work, by which they judge of the effect, and ascertain the stage of progress which they have reached before the die is hardened. The same term is applied by the French to stereotype casts from wood-cuts.

CLICHY, a t. of France, in the department of Seine, about four m. n.w. of Paris, of which it forms a suburb. It has manufactures of white-lead and chemical products. Pop. 14,366.

CLICK-BEETLE, the popular name of many species of coleopterous insects of the tribe *elaterides* (see ELATER), the parents of the destructive larvæ too well known to farmers by the name of wire-worms (q.v.). They derive the name click-beetle from the sound which they make when, being laid on their back on any hard substance, they regain their feet by a spring, in the manner characteristic of the tribe to which they belong. The British species are numerous, the largest not quite half an inch long; none of them brilliantly colored; all very similar in form, rather elongated, and the thorax and abdomen nearly of equal breadth throughout. SKIP-JACK is another popular name for them. The striped click-beetle (*agriotes* [*cataphagus* or *elater*] *lineatus*) is the parent of a very destructive kind of wire-worm.

CLIENT. See AGENT AND CLIENT. See also PRINCIPAL AND AGENT, PATRON, COUNSEL.

CLIFFORD, WILLIAM KINGDON, F.R.S., late prof. of applied mathematics and mechanics at University college, London, and one of the foremost mathematicians of his time, was b. at Exeter, May 4, 1845. He was educated at a school in his native town, at King's college, London, and at Trinity college, Cambridge. While at Trinity, he did not confine himself to examination subjects, but read largely in the great mathematical writers, and was second wrangler in the mathematical tripos of 1867. At this time, while excelling in gymnastics, he would also solve and propound problems in the pages of the *Educational Times*, and could discuss with ease complicated theorems of solid geometry without the aid of paper or diagram. A high-churchman at first, C. before taking his degree threw off all conventional restraints, and eagerly discussed some of the religious questions of the day. In Aug., 1871, he was elected to the chair of mathematics and mechanics at University college, London, which post he retained until his untimely death at Madeira, Mar. 3, 1879. C. first established his reputation as an original thinker with the faculty of expressing scientific thought in plain and simple language by a lecture at the royal institution, *On Some of the Conditions of Mental Development*. He was a valued member of the London mathematical society, contributing to the *Proceedings;* for a time he acted as secretary, and afterwards vice-president of the mathematical and physical section of the British association; he also lectured to the Sunday lecture society on such subjects as *Ether; Atoms;* and *The Sun's Place in the Universe*. The versatility of his mind for philosophical and scientific discussion was further shown by his varied contributions to periodical literature. Besides these articles, he issued the first part of a larger text-book, *Elements of Dynamics* (1878).—See C.'s *Lectures and Essays*, edited by Leslie Stephen and F. Pollock, 1879.

CLIFTON, a beautiful and favorite watering-place in the s.w. of Gloucestershire, forming the western suburb and part of the parliamentary borough of Bristol. It is built on the sides and top of a carboniferous limestone hill, 308 ft. high; commands fine picturesque views; and is separated from a similar cliff by a deep chasm on the s., through which flows the navigable Avon. The rock abounds in fossils and quartz, or Bristol diamonds. It has a tepid spring of 73° F. which contains carbonic acid and salts of magnesia, and was brought into notice about 1695; but the former popularity of the spa has declined, and the pump-room has been destroyed. At the time of the great Lisbon earthquake, this water became red; and the Avon, which rises here 35 ft. at high water, suddenly turned back. On Clifton Down are some remains of a Roman camp, 510 by 300 feet. An extensive camp is in good preservation on the opposite side of the gorge, with which C. is connected by a suspension bridge, 275 ft. above low water, and 702 ft. in span. C. college ranks among the best English schools. See BRISTOL.

CLIFTON, a t. in Ontario, Canada, on the Niagara river, a m. below the falls; pop. about 3,500. It has a large trade with the United States, and is an important station on the Great Western, and Erie and Michigan railways. Its situation near the falls attracts to it a great number of tourists.

CLIMACTERIC YEAR. It was long believed that certain years in the life of man had a peculiar significance to him, and were the critical points, as it were, of his health and fortunes. The mystical number 7 and its multiples (e.g., 35, 49) constituted crises of this kind. The most important of all was the 63d year, called, by way of eminence, the "climacteric year" or "grand climacteric," which was supposed to be fatal to most

men; its influence being attributed to the fact, that it is the multiple of the two mystical numbers 7 and 9.

CLIMATE (from the Greek *klima*, a slope or inclination, afterwards applied to a tract of country, with reference to its supposed inclination to the pole, and the effect of the obliquity of the sun's rays upon the temperature), a term now employed as including not merely the conditions of a place or country with regard to temperature, but also its meteorological conditions generally, in so far as they exercise an influence on the animal and vegetable kingdoms. The effect of the sun's rays is greatest where they fall perpendicularly on the surface of the earth, and diminishes as their obliquity increases; the surface which receives any given amount of the sun's rays increasing with their increased obliquity; whilst at the same time the oblique rays being subjected to the influence of a greater number of particles of the atmosphere, a greater amount of their heat is absorbed before they reach the surface of the earth at all. The greater or smaller extent of surface receiving a certain amount of heat, also makes important differences to arise from *exposure* by slope towards the equator or towards the nearest pole. *Elevation* is a most important cause of differences of climate. As we ascend from the level of the sea to the greatest mountain altitudes, even at the equator, the temperature gradually diminishes, owing to the diminished density of the atmosphere, and we reach a region of perpetual snow, as in approaching the poles. The progressive diminution of the temperature is, however, affected by many other causes, so that the line of perpetual snow is far from being at the same elevation in all places of the same latitude. Thus, the snow-line on the southern side of the Himalayas is depressed by the moisture of the aërial currents from the Indian ocean; and that on the northern side is elevated by the radiation of heat in the vast dry table-lands of Central Asia, and the consequent ascending streams of warm dry air; so that the difference between the two is not less than 4,000 ft. in favor of the *northern* side of the mountain-ranges; and Humboldt says, "millions of men of Thibetian origin occupy populous towns in a country where fields and towns would, during the whole year, have been buried in snow, if these table-lands had been less continuous and less extensive." As the actual temperature of the atmosphere depends not so much upon the direct rays of the sun as upon the radiation from the heated surface of the earth, the diversities in the character of that surface are productive of great effects in modifying climate. A sandy desert, a tract of country clothed with luxuriant vegetation, and an expanse of water, absorb and radiate heat in very different degrees. A newly plowed field both absorbs and radiates heat much more rapidly than a field covered with grass. A sandy desert heats the atmosphere above it much more than either a fertile tract or a watery expanse, and a watery expanse still less than a fertile tract; but, on the other hand, the desert cools sooner by radiation; whilst the heat absorbed by the water being diffused through a larger mass—partly by reason of the motion continually taking place in the fluid substance—and affecting greater depths, the influence of the ocean, of seas, and of great lakes, is very powerful in maintaining a greater equality in the temperature of the atmosphere. Thus maritime places, and particularly islands and peninsulas, have a more equal temperature, with less diversity of the extremes of summer and winter, than more inland or continental places otherwise similarly situated. The effect of the sea is modified by many circumstances, and particularly by currents, of which the Gulf stream (q.v.) affords a notable instance, the heated water conveyed by it from the equatorial to the polar regions having a great influence on the C., particularly of the n.w. of Europe. The temperature of Europe is also in part dependent on the warm s. winds, which have absorbed heat from the great sandy deserts of Africa; and over the world generally, atmospheric currents must be regarded as exercising even a greater influence on C. than oceanic currents. The quantity of rain or snow that falls in the course of a year, and the times and manner of its falling, are circumstances which have a great effect on climate. These are circumstances much influenced by the distribution of land and water, and by the elevation and character of the surface of the land, which, doubtless, also influence electric and other meteorological conditions, less understood, but certainly not unimportant.

The relations of C. to vegetation are determined not merely by the mean annual temperature, but in a great measure also—and, with regard to many plants, entirely—by the duration and C. of summer. Thus, maize, which may be mentioned as an important example, succeeds well in climates of which the winter-cold is severe, the summer season alone being sufficient for its whole life; whilst, on the other hand, such plants as fuchsias, some kinds of laurel, and even the common hawthorn, which succeed well enough where maize would scarcely put forth an ear, would perish from the colder winters of countries where it is profitably cultivated. The polar limit of particular species of animals, except those which hibernate, is generally determined by the degree of winter-cold which they can bear without injury.

Bogs and marshes exercise an unfavorable influence on C., cooling the air and causing fogs, as clay-soils also to some extent do, through their retentiveness of moisture; whilst marshes of some kinds, and in some situations, abound in exhalations very unfavorable to health. Similar remarks apply to large tracts of forest. The clearing, drainage, and cultivation of land have generally favorable effects on C.; although plantations are often beneficial for shelter; and a too complete removal of natural forests may pre-

vent the deposition of moisture from the atmosphere to such a degree as to cause droughts, a result strikingly exemplified in some of the smaller West India islands, and the tendency to which is said to be manifested on the great scale in the eastern part of the continent of North America.

The important and difficult subject of C. will be found further elucidated in some of the principal geographical articles, and in the articles AGRICULTURE, ARBORICULTURE, ATMOSPHERE, METEOROLOGY, MONSOONS, RAIN, SEASONS, STORMS, TRADE-WINDS, WIND.

CLI'MAX, a Greek word signifying primarily a *stair*, and in rhetoric, that artifice which consists in placing before the mind of the reader or hearer a series of propositions or objects so arranged that the least forcible strikes it first, and the others rise by successive gradations in impressiveness.

CLIMBERS, *Scansores*, in ornithology, an order of birds generally characterized by having two toes before opposed by two toes behind, so as to adapt their feet in a remarkable degree for the purpose of grasping the branch of a tree or any similar object. Many have not two toes permanently directed backwards, but have the power of turning one of the front toes backwards at pleasure. Some have only three toes, but yet on other accounts are unhesitatingly ranked in this order. The families of the C., however, differ very much in many respects, although agreeing in the structure of their feet. To this order belong parrots, toucans, trogons, barbets, woodpeckers, and cuckoos. It has been objected to the name C., that although very descriptive of the habits of some birds of this order, as woodpeckers, it is not very applicable to others, as cuckoos, whilst there are birds of other orders, as creepers, which possess this habit in the greatest degree; and the name has been changed by some ornithologists into *yoke-footed* or *zygodactylous birds*. It is generally the outer front toe which is directed backward in this order; but in the trogons, the first and second toes are opposed to the third and fourth.

CLIMBING FERN, *Hygodium palmatum*, a species of fern found, rarely, from Massachusetts to Virginia and Kentucky, remarkable for climbing or twining around weeds and shrubs. The leaves are broadly palmate, and the fertile frondlets form a panicle upon the upper portion of the stem. It is prized for interior decoration of houses.

CLIMBING PERCH, *Anabas scandens*, the only well-ascertained species of a genus of fishes, from which the family *anabasidæ* (q.v.) derives its name. It is a native of rivers and ponds in most parts of the East Indies. It is about 6 in. long. In general form, it somewhat resembles a perch, and the resemblance is increased by the large scales and the spiny dorsal fin. That this fish climbs trees, has been asserted by observers whose veracity and accuracy cannot easily be questioned; yet others, who have enjoyed ample opportunity of observation, express great doubt concerning this habit. In climbing, the fish is said to suspend itself by its spiny gill-covers, and by fixing its anal fin in cavities of the bark, urging its way upwards by distending and contracting its body. There is no doubt that it often leaves pools when they are in danger of being dried up, and travels in search of water. Though these fish are sometimes compelled in their distress to travel by day, and have been met in the glare of noon toiling along a dusty road, their migrations are generally performed at night or in early morning, whilst the grass is still wet with dew. Climbing perches are plentiful in the Ganges, and the boatmen have been known to keep them for five or six days in an earthen pot without water, using daily what they wanted, and finding them as lively as when just caught.

CLIMBING PLANTS, or CLIMBERS, are, in the most extensive and popular sense of the term, those plants which, having weak stems, seek support from other objects, chiefly from other plants, in order to ascend from the ground. This, however, is accomplished in very different ways. Some climb by means of small root-like processes growing from the stem, as the ivy; some by means of *cirri* or tendrils, which twine round branches of trees, etc. (see CIRRUS); some by adhering disks, of which a beautiful instance is to be seen in the well-known Virginian creeper; and many by the twining of their own stems around those to which they cling. Twining plants generally turn only in one direction, either from right to left, or from left to right. The scarlet-runner and passion-flower are examples of the former; the honeysuckle and hop of the latter. Twining plants are not always included under the designation climbing plants. The woody twining plants, which form one of the most remarkable features of tropical forests, are often called *lianas* (q.v.).

CLINCH, a co. in s.e. Georgia, on the Florida border, intersected by the Little Suwannee river and the Atlantic and Gulf railroad; 1000 sq.m.; pop. '80, 4,138—838 colored. It is a level and swampy region; chief productions, rice, corn, cotton, oats, etc. Co. seat, Magnolia.

CLINCHER-BUILT, or CLINKER-BUILT, is a name applied in ship-building, when the lower edges of the side-planks overlap the row next under them, like slates on the roof of a house. If the planks are all smooth, meeting edge to edge, the construction is called *carvel-built*. This construction requires that the seams should be very close, and calked with oakum. Boats are often *diagonal-built;* two layers of planking, rising in opposite directions from the keel at an angle of 45°. In iron ships, the clincher arrangement is called *lap-jointed*, and the carvel arrangement *jump-jointed*.

CLINCH RIVER, rising in s.w. Virginia, flows into Tennessee between Clinch and Powell mountains, joining with the Holston, and forming the Tennessee. Its length is about 200 miles.

CLINGMAN, THOMAS LANIER, b. N. C., 1812; graduated from the university of North Carolina in 1832; practiced law, and was elected a member of the state legislature and of congress. In 1858, he was appointed to fill a vacancy in the U. S. senate. In the rebellion he sided with the confederacy, was expelled from the senate, and served as a col. in the confederate army.

CLINGMAN'S DOME, the highest peak of the Smoky mountains in North Carolina on the border of Tennessee. It is 6,600 ft. above the sea level; and is the second highest of the Appalachians.

CLINIC BAPTISM (Gr. *klinē*, a bed), in the ancient church, baptism administered to a person on a sick-bed or death-bed. The practice and the term alike indicate notions concerning baptism which have no foundation in Scripture, and which, although once extremely prevalent, have now almost entirely disappeared.

CLINIC MEDICINE is that department of the art which is occupied with the investigation of diseases at the bedside, or individually.

CLINKSTONE, or PHONOLITE, is a grayish green feldspathic rock, remarkable for its tendency to lamination, which is sometimes such that it affords tiles for roofing. It is a compact homogeneous rock, passing gradually into gray basalt. The slabs give a metallic ring or "clink" when struck with a hammer, whence its name. It occurs in volcanic districts.

CLINOM'ETER, an instrument for the purpose of taking the dip and strike of a stratum. It consists of a compass provided with a small spirit-level, and on the lid—which can be fixed at right angles to the compass-box—there is a small graduated quadrant, and a plumb-line.

CLINTON, a co. in s.w. Illinois, on Kaskaskia river, intersected by the Ohio and Mississippi and the Illinois Central railroads; 420 sq.m.; pop. '80, 18,718. It consists of fertile prairies with tracts of forest land. Productions chiefly agricultural. Co. seat, Carlyle.

CLINTON, a co. in central Indiana, reached by the Indianapolis, Cincinnati, and Lafayette railroad; 432 sq.m.; pop. '80, 23,473. Its surface is mostly of forest and prairie lands; chief business, agriculture. Co. seat, Frankfort.

CLINTON, a co. in e. Iowa, on the Mississippi river, intersected by the Chicago and North-western railroad; 696 sq.m.; pop. '80, 36,764. It has a surface of prairie and forest, with generally fertile soil, producing the usual agricultural crops. Co. seat, Clinton.

CLINTON, a co. in s. Kentucky, on the border of Tennessee, bounded n. by the Cumberland river; 350 sq.m.; pop. '80, 7,212—310 colored. The surface is hilly, and in some parts mountainous. Agriculture is the chief business. Co. seat, Albany.

CLINTON, a co. in central Michigan, on Grand, Maple, and Looking-glass rivers, reached by the Detroit, Lansing, and Lake Michigan, the Jackson, Lansing, and Saginaw, and the Detroit and Milwaukee railroads. The chief business of the people is agriculture. Co. seat, St. John's. Pop. '80, 27,534.

CLINTON, a co. in n.w. Missouri, reached by the Hannibal and St. Joseph, the Cameron and Kansas City, and a branch of the North Missouri railroads; 460 sq.m.; pop. '80, 16,073—975 colored. The surface is chiefly prairie, but there is plenty of woodland. Productions agricultural. Co. seat, Plattsburg.

CLINTON, a co. in n.e. New York, on the Canada border, bounded e. by lake Champlain, and s. by Ausable river, and traversed by the Vermont and Canada, the Montreal and Plattsburg, and the Whitehall and Plattsburg railroads; 952 sq.m.; pop. '80, 50,901. The soil is fertile, level near the lake, and hilly further inland. There is abundance of iron ore of the best quality. Chief productions, wheat, corn, oats, buckwheat, hay, butter, wool, and maple sugar. The Clinton state prison is at Dannemora, in this county. Co. seat, Plattsburg.

CLINTON, a co. in s.w. Ohio, traversed by the Cincinnati and Muskingum Valley, and the Marietta and Cincinnati railroads; 467 sq.m.; pop. '80, 27,539. Surface undulating, and soil fertile. The chief business is agriculture. Co. seat, Wilmington.

CLINTON, a co. in central Pennsylvania, on the Susquehanna river, traversed by the West Branch canal, the Philadelphia and Erie, and a division of the Pennsylvania Central railroads. Surface mountainous; chief occupations, agriculture and lumbering. Co. seat, Lock Haven. Pop. '80, 26,278—284 colored.

CLINTON, a city in Clinton co., Iowa, on the Mississippi river, 42 m. above Davenport; pop. '70, 6,129. It is on the Chicago and North-western railroad, at the junction of several other railroads. The Mississippi is crossed at Clinton by a bridge 4,100 ft. long. In the city are the repair shops of the railroad, and a number of manufactories. It has a large and rapidly increasing trade.

CLINTON, the seat of justice of East Feliciana parish, La.; 85 m. n.w. of New Orleans; pop. '70, 930—207 colored. There is railroad communication with Port Hudson.

CLINTON, a t. in Worcester co., Mass., 32 m. w. of Boston, on the Nashua river; pop. '80, 8,030. The people are extensively engaged in manufacturing carpets, cotton and woolen goods, boots and shoes, etc. The Boston, Clinton, and Fitchburg, and the Worcester and Nashua railroads reach the village.

CLINTON, a t. in Hunterdon co., N. J., 31 m. n.w. of Trenton, on the s. branch of Raritan river, and the New Jersey Central railroad; pop. '80, 2,975; of the borough, 785. It is in the midst of a fine agricultural region, and has many important manufactories.

CLINTON, a village in Oneida co., N. Y., on Oriskany creek and the Chenango canal, and the Utica and Binghamton railroad; pop. '70, 1640. It is the seat of Hamilton college, and a place of important manufacturing business.

CLINTON, a village in Huron co., province of Ontario, Canada, 13 m. from Goderich, on a branch of the Grand Trunk railroad; pop. about 2000. Near the place are valuable salt wells, and a deposit of rock-salt 20 ft. thick. There are various manufactories.

CLINTON, CHARLES, 1690–1773; a native of Ireland, and progenitor of the Clintons of New York, of whom his grandson De Witt was the most famous. The grandfather of Charles was an adherent of Charles I., and fled to the n. of Ireland on the fall of the king. After a voyage in which a number of the emigrants starved to death, C. landed at cape Cod in 1729, and in 1731 settled in Ulster co., N. Y., where he was a farmer, a land surveyor, and a judge of the local court. In 1756, with two of his sons, he served in the campaign against Fort Frontenac.

CLINTON, DE WITT, an American statesman of English origin, son of a maj.gen. in the U. S. army, and descended, on his mother's side, from the Dutch family of De Witt, was b. in 1769, at Little Britain, state of New York. Being admitted to the bar, he became private secretary to his uncle, gen. George Clinton, till the end of his administration in 1785. In 1797, he was elected a member of the New York legislature, and in 1801, chosen a senator of the United States. Subsequently, he was elected mayor of New York, from which office the violence of political parties occasioned his retirement in 1815. Between 1817 and his death in 1828, he was repeatedly governor of New York state. The formation of the great canal from lake Erie to the Hudson was mainly owing to his persevering endeavors. He was a member of most of the literary and scientific institutions of the United States, and of several of those of Great Britain and the continent of Europe. Besides various fugitive pieces, his productions consist of speeches, governor's messages, discourses before various institutions, addresses to the army, communications regarding Lake Erie canal, and judicial opinions.

CLINTON, DE WITT (*ante*), 1769–1828; b. N. Y., was the son of James Clinton and Mary De Witt, and grandson of Charles the immigrant from Ireland. His paternal ancestors, although long resident in Ireland, were of English origin, and his mother was of Dutch-French blood. He was educated at Columbia college, graduating with high honors. Choosing the law for his vocation, he studied under Samuel Jones, afterwards chief justice of the United States superior court. Admitted to the bar in 1788, C. entered immediately into political life, becoming an ardent supporter of his uncle, George Clinton, who was governor of the state (from 1777 to 1795 and from 1801 to 1804), and the leader of the republican party. Young C. took an active interest in the adoption of the federal constitution, and reported for the press the proceedings of the convention held for that purpose; about the same time and afterwards acting as his uncle's private secretary. His first office was secretary of the board of regents of the university; and the next, secretary of the board of commissioners of state fortifications. He opposed the administration of John Adams, and also that of John Jay, governor of the state; but while opposing Adams's hostility to France, he raised and commanded an artillery company to resist the French in case war should come. In 1797, he was elected to the state assembly as a representative of New York city, where he made his residence, and the next year was chosen state senator for four years. By virtue of his senatorial office, C. became a member of the council of appointment, a body consisting of one senator from each district to whom the governor made nominations for state and local offices. Up to this time the governor had exercised the exclusive right to make nominations; but C. vigorously attacked the system, and succeeded in procuring an amendment to the constitution giving the members of the council of appointment equal rights of nomination with the governor. During this period C. found time to devote himself to scientific and social questions, studying natural history, and other sciences. The protection and improvement of the public health, and the enactment of laws in favor of agriculture, manufactures, and the arts, and especially the use of steam in navigation, engaged his restless mind. He labored also for the abolition of slavery, and of its kindred barbarism, imprisonment for debt. In 1799, when but 33 years of age, he was appointed a senator of the United States, where he greatly increased his popularity, particularly by his wise and moderate counsel in a high excitement then existing against Spain in con-

sequence of alleged violation of treaty stipulations affecting the Mississippi and its trade. Before his term in the senate expired, C. resigned to accept the office of mayor of New York, an appointment made by his uncle, the governor, and the council of appointment. He held the mayor's office four years; was removed; again appointed in 1809; again removed in 1810; finally appointed in 1811, again holding four years, through the period of the war with England. He was also a member of the state senate from 1805 to 1811; lieutenant-governor for the next two years, and for part of this time again a member of the council of appointment. In 1804, his uncle, the governor, was elected vice-president of the United States, and soon afterwards, by reason of age, retired from political life, leaving the partisan scepter of the Clintons in the hands of De Witt, who speedily became the leader of the republican party in New York, and their candidate for president, near the close of Madison's first term. Madison, backed by his war record, was easily nominated by the republican congressional caucus; but the New York section of the party insisted on running Clinton. The result was a disastrous defeat for the latter, he having but 89 electoral votes to 128 for Madison. This severe blow led C. to a temporary cessation of political work, and he turned his attention to less exciting subjects. His partisan opponents considered his political life at an end; but they were wrong. He took a leading part in establishing the free-school system of New York city, and in the establishment and promotion of various institutions of science; in the improvement and modification of criminal laws; in the extension of agriculture and manufactures; in the relief of the poor, the improvement of morals, and the advancement of all worthy objects. For many years no important movement was made in these and kindred matters with which he was not identified, and oftener than otherwise as the master spirit. All these, however, were little in comparison with the great object on which his fame securely rests—the Erie canal. He was an early and energetic advocate of internal improvements, especially such as could connect the great lakes by navigable channels with the tide-water of Hudson river, and no man so eloquently or so prophetically set forth the great advantages that such works would bring to New York city. How these prophecies have been fulfilled the position of that city as the commercial center of the two Americas will attest. It would require many pages to record with what zeal, tireless energy, patience, and hope, he labored for this great object. "Clinton's folly" was the by-word of scoffers through dark years of discouragement, but he never despaired, never yielded an inch, until, a dozen years after his great political defeat, a line of cannon stationed at intervals along the much ridiculed "ditch," and starting their firing at Buffalo, awakened the people of the "Empire State" to the fact that the waters of lake Erie were pouring through the canal, bearing on their waves the message that the great lakes were on that day wedded to the ocean. In the mean time he was never entirely out of the political field. In 1816, the governor (Daniel D. Tompkins) was chosen vice-president, and resigned the governorship. C. was brought forward for the place, bearing not only the odium of advocating the "big ditch" and of the crushing defeat as a presidential candidate four years before, but the additional ignominy of having been but one year before removed from the office of mayor of New York by a council of appointment controlled by his own party. To run for governor seemed madness, yet the innate power and greatness of the man gave him an easy victory, and he was elected by a heavy majority. He was re-elected in 1820, in 1824, and in 1826. In 1822, he was out of the field, and his enemies once more celebrated his political funeral, adding, in the course of their two years' rule, the indignity of removing him from the office of commissioner of the canal then under way. This outrage was more than the people could bear, and C. was at once brought forward for governor, running against Samuel Young. The disgraced canal commissioner was elected by 17,000 majority. He died suddenly in his chair while engaged in official duty at Albany. Among his published works are *Discourse before the New York Historical Society; Memoir on the Antiquities of Western New York; Letters on the Natural History and Internal Resources of New York; Speeches to the Legislature;* and many historical and scientific addresses.

CLINTON, GEORGE, 1739–1812; b. N. Y.; youngest son of Charles Clinton. His first noteworthy adventure was connected with privateering in the French war of 1763. He was an officer in the expedition against fort Frontenac, and after the war went into the law and politics. He was chosen to the colonial assembly and to the continental congress, was made brig.gen. in the revolutionary army, and in 1777 was elected first governor of the state of New York. He was re-elected, and occupied the executive chair in all for 18 successive years, and in 1800 was chosen for one more term, making 21 years as governor. In 1804, he was elected vice-president of the United States, holding the office until his death, or during all except 10½ months of Madison's two administrations.

CLINTON, Sir HENRY, 1738–95; grandson of Francis, sixth earl of Lincoln. Sir Henry was a maj.gen. of the British army in the American revolution, was in the battle of Bunker Hill, and took possession of New York after the defeat of Washington's forces in the battle of Long Island, Aug. 26, 1776. In 1778, he succeeded sir William Howe as commander-in-chief. He returned to England in 1782, and in 1793 he was made governor of Gibraltar, where he died.

CLINTON, HENRY FYNES, a very distinguished classical scholar, was b. Jan. 14, 1781, at Gamston, in Nottinghamshire; educated at Southwell school, and afterwards at Westminster. In 1799, he went to Oxford, and in 1805 took his degree of M.A. Next year, he entered parliament as member for Aldborough, which he continued to represent until 1826. He died Oct. 24, 1852. C.'s two great works are the *Fasti Hellenici* (1824–34), and *Fasti Romani* (1845–50). They are known to all European scholars, and contain an immense store of learning.

CLINTON, JAMES, 1736–1812; b. N. Y.; fourth son of Charles the immigrant, and father of De Witt. He went into the English army, serving as a captain in the French war, distinguishing himself in the capture of fort Frontenac. In the revolution he took the side of the colonies, and was made brig.gen. He was wounded at the capture of fort Clinton by the British, but escaped with a part of the garrison across the Hudson river. He was engaged against the Indians in gen. Sullivan's Iroquois expedition, and was present at the siege of Yorktown and the surrender of Cornwallis, and at the evacuation of New York by the English. He was a delegate to the New York convention which adopted the federal constitution.

CLINTON STATE PRISON, in Clinton co., N. Y., in the t. of Dannemora; pop. of township, '75, 1863. The prison comprises a number of buildings inclosed in a stockade which surrounds 37 acres of land. This location was chosen for the purpose of employing convicts in the mining and manufacture of iron, there being abundance of that ore on the tract belonging to the prison, or to the state. It is also in a densely wooded region, and the timber furnishes the charcoal used in the furnaces. The prison was begun in 1844.

CLIO, a genus of shell-less pteropodous mollusks, of which one species, *C. borealis*, is extremely abundant in the Arctic seas, and constitutes a principal part of the food of whales, so that indeed the name *whale's food* is often given to it by whale-fishers. It is scarcely an inch long; the head is furnished with six retractile tentacula; the organs of locomotion are two delicate fins, attached to the neck, and which in swimming are brought almost in contact, first above, then below. It is an active little creature, often coming for an instant to the surface of the water in calm weather, and then suddenly diving away into the depths. Myriads are seen together, and the water is sometimes so full of them that a whale cannot open its mouth without engulfing them in great numbers. *C. australis* is almost as abundant in the southern seas as *C. borealis* in the northern.

CLI'O, in Grecian mythology, the daughter of Jupiter and Mnemosyne, the mother of Hyacinthus and Hymenæus. She was the muse of history and epic poetry, and was represented as bearing a half-opened roll of a book.

CLIPPER is a name familiarly given to a ship built expressly for speed. The requirements of trades in which the merchandise carried was of a perishable nature, and rendered a quick passage desirable, were probably among the first causes which directed scientific attention to the *lines* of vessels for the purpose of ascertaining the form adapted to offer least resistance to the water. For many years the fruit-clippers have been celebrated for their rapid passages; and the opium-clippers, and slavers, have attained an unenviable notoriety for speed. The modifications of the old form of vessel have been gradual, the desideratum aimed at being the combination of the greatest carrying capacity with the form best adapted for speed. Perhaps the most successful improvements have been those of the Aberdeen builders, the Americans, and Mr. Scott Russell. A C., as compared with an ordinary sailing-ship, is longer and narrower (though of late the tendency has been to increase the beam); very sharp at the bows, which are generally hollowed more or less below the water-line; gracefully fined away towards the stern, which is usually elliptical; and, altogether, presenting the contrast of the race-horse to the beast of burden. Some of the C. ships now running from Liverpool to America and to Australia are among the most magnificent vessels in the world. The *Lightning*, during a voyage from Melbourne to Liverpool, ran 2,550 English miles in one week, or at the rate of 15½ m. an hour during the whole period. The Americans have fully done their part in introducing rapid C. ships, both for ocean and for river navigation, for steamers and for sailing-ships.

CLIPPING THE COIN. See COINING.

CLIS'THENES, or CLEISTHENES, an Athenian, grandson of the tyrant Sicyon, who, after the expulsion of Hippias from Athens, took the side of the common people against the would-be tyrant Isagoras, and effected some changes in the constitution which tended to increase the rights and privileges of citizens, his object being to destroy the old aristocracy. He is said to have been the first to introduce the punishment of ostracism, and the first to suffer from it. He was banished by the Athenians, and 700 families of his followers also were sent away; but Isagoras finally failed of his purpose, and Clisthenes and the banished families were recalled.

CLI'THEROE, a parliamentary and municipal borough in the w. of Lancashire, on the left bank of the Ribble, 28 m. n. of Manchester. It lies on a low eminence of carboniferous limestone, at the base of Pendle hill, which is 1803 ft. high. Pendle forest

is celebrated as the locality of the exploits of the Lancashire witches. The main street runs along the ridge of the eminence, and at its s. end are the ruins of a castle, founded in the time of William Rufus by the Lacys. C. has print works, cotton manufactures, and limekilns. It sends lime to all parts of the kingdom. About 5 m. w. of C. lies Stonyhurst college, the principal seat of the Jesuits in England. Pop. '71 of the parliamentary borough, 11,786. It returns one member to parliament.

CLITUMNUS (now CLITUMNO), a small river in Umbria, Italy, celebrated for the clearness of its waters and the beauty of the cattle raised upon its banks. Its source is near Spoleto, and after a course of 9 m. it takes the name of Timia. It was once so famous that Caligula, Honorius, and other great people made special visits to its banks. Near the river was a grove of cypresses, and close above the water was a temple to Clitumnus, supposed to be the same now occupied as a Christian chapel. The white cattle peculiar to the valley of the Clitumnus were held in great demand for sacrifices to the gods.

CLITUS, or CLEITUS, foster-brother of Alexander the Great, who saved Alexander's life at the battle of Granicus 334 B.C. when, with a blow of his sword, he severed the arm of Spithridates which was stretched out to slay the king. He held high positions in Alexander's armies, and in 328 was made satrap of Bactria; but on the night before he was to leave for his satrapy a feast was given by Alexander in honor of the Dioscuri. Both the king and Clitus became excited with wine, and a wrangle ensued in which Alexander thrust him through with a spear and killed him.

CLIVE, ROBERT, Lord, Baron of Plassey, one of the greatest warrior-statesmen of whom England can boast, the founder of British supremacy in India, was b. at Styche, in Shropshire, 1725. At school he exhibited little aptitude for learning, but was noted for his mischievous propensities and his fearless disposition. The monotony of a clerkship in the India Civil Service at Madras, where he arrived in 1744, had literally nearly been the death of him; it was with great joy, therefore, that he abandoned the pen for the sword, when, some three years after his arrival, the troubles accumulating upon the English in India gave him an opportunity of doing so. C. had now found his true sphere. The bold, fearless character had now scope enough for its development; the intellect which, chained to the desk, had seemed of the dullest and most common-place kind, in the freedom of the field became at once quick, comprehensive, and original. When C. grasped the sword, English influence in India was almost extinct; the French and their allies had scarcely left them even a material footing. Yet, in less than a half-a dozen years after, C. had, in Aug., 1751, with 200 English infantry and 300 sepoys, marched out of Fort St. David on his hazardous enterprise to attack Arcot, a city of 100,000 inhabitants, and garrisoned by 1,200 or 1,500 of Chunda Sahib's best troops, amply supplied with artillery, the decisive battle of Plassey had been fought, and English power established on the ruin of that of France and the native princes. The daring displayed in the capture of Arcot, and the intrepidity and fortitude exhibited in its defence by C. and his little band, reduced to 200 men, against an army of 10,000, was the foundation of England's subsequent greatness and glory in India. C.'s name henceforward was a tower of strength in India, where he was surnamed by the natives *Sabat Jung*, or "the Daring in War." Victory marched with him alike against native warriors, French, and Dutch. Unscrupulous as to his means, he would undoubtedly have found himself involved in many difficulties had not his questionable actions been invariably crowned, and thus—in the lax political notions of the time—justified, by success. Nothing remaining for him to do in India, he returned to England in 1760, and received the warm thanks of the company and an Irish peerage from the government for his services. His wealth, arising from shares in various spoils, presents, and grants of territory from native princes, was enormous. After his departure from India, the company's affairs, through the dishonesty of its servants, high and low, fell into a state of the greatest confusion, and C., in 1764, was chosen to set them right. He proved himself as competent an administrator as he was a warrior. Uncompromising and resolute, he bore down every opposition to his plans, all the more sternly that he found it in some cases assuming the form of threats. In less than 18 months, he had "restored perfect order and discipline in both the civil and military services, and brought back prosperity to the well-nigh ruined finances of the company." He returned to England in 1767, and was received with the distinction to which his important services entitled him. But the energetic way in which he had righted matters in India, gave offence to those who suffered from the suppression of dishonest practices, many of whom were not without considerable influence in the mother-country. This influence they employed to stir up ill-feeling against C.; and his proceedings in India were made the subject of animadversion in parliament in 1772, and, in the following year, matter for the inquiry of a select parliamentary committee; who, however, failed to find that C. had acquired his great wealth by abuse of power, as his enemies had asserted. The form of acquittal, however, was not quite satisfactory to C., who never got over the disgrace implied in the trial; and ended his life by suicide, Nov. 22, 1774.

CLŌA'CA. See the article BIRDS. A similar anatomical arrangement is found in one order of mammals, the monotremata (q.v.), in all reptiles, and in many fishes.

CLOACA MAXIMA. This was a subterranean passage of vast extent, by which the whole, or a great part, of the filth of ancient Rome was conveyed to the Tiber. Drains from the lower parts of the city around the forum, and from the other valleys, were commenced by Tarquinius Priscus; but the construction of the C. M. is attributed by Livy to Tarquinius Superbus. Niebuhr is of opinion that it was at first intended to drain the valley of the forum; but it appears to have been subsequently extended, and connected with the smaller cloacæ. Running from the forum past the temple of Vesta, it terminated at the Tiber, where the mouth of it is still visible. It consisted of 3 large arches, one within the other. The space inclosed by the innermost vault was upwards of 13 ft. in width, and of a corresponding height. The arches were built of large blocks of stone, fixed together without cement, of the uniform size of rather more than 5 ft. 5 in. long, and 3 ft. high. The species of stone used bears evidence to the antiquity of the construction, being the material which was employed in the most ancient public edifices. The sewer was kept in a state of efficiency by a continual stream of superfluous water from the aqueducts. Large portions of this and of the other cloacæ remain, in some places still visible, but generally buried, by the accumulation of soil, at a considerable depth below the present level of the streets. During the republic, the surveillance of the Roman cloacæ was one of the duties performed by the censors. The C. M. was subjected to repair by Cato and his colleague in the censorship. Agrippa, when ædile, obtained praise for his exertions in cleansing and repairing the cloacæ, and is recorded to have passed through them in a boat. Under the empire, officers called *curatores cloacarum urbis* were appointed for their supervision. So thoroughly was the city undermined by these large sewers, that Pliny calls it *urbs pensilis*, a city suspended in the air rather than resting upon the earth. Drains of the same description, but of smaller dimensions, existed in some others of the ancient Roman cities.

CLOACI'NA, in Roman mythology, the goddess of sewers, mentioned in very early times. Pliny derives the name from a verb which meant to wash or purify. (See CLOACA MAXIMA, *ante.*)

CLOCK BELL-METAL is principally an alloy of copper and tin with smaller quantities of bismuth, antimony, lead, and zinc. A common alloy is 80 parts of copper, 10 tin, 5½ zinc, and 4½ lead. The bismuth and antimony make the bell more brittle, but they communicate a better tone; and where the proportion of tin rises as high as 20 per cent., or 1 part of tin to 4 of the other metals, a very much more sonorous bell is obtained.

CLOCKS, CURIOUS. Among remarkable clocks, one of the best known is that in the Strasbourg cathedral. Another, illustrating the elaborateness to which clock-work is sometimes carried, was placed on exhibition in New York in the summer of 1880. It is the work of Felix Meier, who spent more than 10 years on its construction. It is 18 ft. high, 8 wide, and 5 deep. It has 2,000 wheels, runs by 700-lb. weights, and is wound up once in 12 days. Above the main body of the clock is a marble dome, upon which Washington sits in his chair of state, protected by a canopy which is surmounted by a gilded statue of Columbia; on either side of Washington is a servant in livery, guarding the doors, which open between the pillars that support the canopy; on the four corners of the main body of the clock are black walnut niches; one of the niches contains the figure of an infant, the second the figure of a youth, the third of a man in middle life, the fourth of an aged graybeard, and still another, directly over the center, contains a skeleton, representing father Time. All of these figures have bells and hammers in their hands. The infant's bell is small and sweet-toned; the youth's bell larger and harsher; the bell of manhood strong and resonant; that of old age diminishing in strength, and the bell of the skeleton deep and sad. A figure of William C. Bryant, and another of prof. Morse rest upon the pillars that support the planetary system. The astronomical and mathematical calculation, if kept up, would show the correct movement of the planets for 200 years, leap years included. When the clock is in operation it shows local time in hours, minutes, and seconds; the difference in time at Chicago, Washington, San Francisco, Melbourne, Pekin, Cairo, Constantinople, St. Petersburg, Vienna, London, Berlin, and Paris; the day of the week, calendar day of the month, month of the year, and seasons of the year, the signs of the zodiac, the revolutions of the earth on its own axis, and also around the sun; the revolutions of the moon around the earth, and with it around the sun; also, the moon's changes from the quarter to half, three-quarters, and full; the correct movement of the planets around the sun, comprising Mercury, which makes the revolution once in 88 days; Venus, once in 224 days; Mars, once in 686 days; Vesta, once in 1,327 days; Juno, once in 1,593 days; Ceres, once in 1,681 days; Jupiter, once in 4,332 days; Saturn, once in 10,758 days; Uranus, once in 30,688 days. There is, therefore, a movement in this wonderful piece of machinery which cannot regularly be repeated more than once in 84 years. But the inventor has a crank attachment to the clock, by means of which he can hasten the working of the machinery, in order to show its movements to the public. By turning continuously 12 hours a day, for 16 days and 8 hours, a perfect revolution of the planet Uranus around the sun would be made. At the end of every quarter hour the infant in his carved niche strikes with a tiny hammer upon the bell which he holds in his hand. At the end of each half hour the youth strikes; at the end of three-quarters

of an hour the man, and at the end of each hour the graybeard, death then follows with a measured stroke to toll the hour. A large music box, manufactured at Geneva expressly for this clock, begins to play at the same time that the skeleton strikes the hour, and a surprising scene is enacted upon the platform beneath the canopy. Washington slowly rises from his chair to his feet, extending his right hand, presenting the declaration of independence; the door on the left is opened by the servant, admitting all the presidents from Washington's time, including president Hayes. Each president is dressed in the costume of his time. Passing in file before Washington, they face and raise their hands as they approach him, and walking naturally across the platform disappear through the opposite door, which is promptly closed behind them by the second servant. Washingington retires into his chair, and all is quiet, save the measured tick of the huge pendulum, and the ringing of the quarter hours, until another hour has passed.

CLOCKS AND WATCHES. See HOROLOGY.

CLODIUS PULCHER, PUBLIUS, (real name, PUBLIUS CLAUDIUS PULCHER), appears in history, 70 B.C., serving under Lucullus in Asia, and in civil affairs in 69, when he impeached Catiline for extortion in Africa; but Catiline bribed the accuser and escaped. Clodius appears to have been avaricious and unscrupulous. Near the close of the year 62, Clodius was said to have had an intrigue with Pompeia, wife of Julius Cæsar, on the occasion of the celebration of the Bona Dea in Cæsar's house. Clodius was tried for violation of the sacred mysteries, but was acquitted, it was charged because he had bribed the judge. He was elected tribune in 59, and one of his first acts was to exile Cicero, who had refused to defend him in the trial for sacrilege, but the great orator was soon afterwards recalled in spite of Clodius's opposition. He went on from bad to worse, gathering around him the worst elements of the people, until he became a candidate for the prætorship (53 B.C.) in opposition to Milo. Both candidates worked with the energy and recklessness supposed to be characteristic only of modern times. The contest was ended in an unexpected manner, Jan. 20, 52 B.C. Milo set out on a journey to Lanuvium. On the way he met Clodius, who was on his road to Rome. Both were accompanied by armed followers, but passed each other without disturbance. However, some of the men in the rear guard of each party began to quarrel, a fight followed, and Clodius was killed.

CLOG AL'MANAC, the name given in England to a primitive kind of calendar or almanac, called also a "rim stock" and "prime staff." In Scandinavia it was called a "Runic staff," from the Runic characters used in its numerical notation. It was generally of wood (whence its name of "clog," *i.e.*, log or block), but was sometimes of brass, of bone, or of horn. When of wood, it was most commonly of box; but elm, fir, and oak, were also employed. "This almanac" says Dr. Plot, in his *Natural History of Staffordshire*, written in 1686, when it was still in use among the common people of that county—"is usually a square piece of wood, containing three months on each of the four edges. The number of days in them are expressed by notches; the first day by a notch with a patulous stroke turned up from it, and every seventh by a large-sized notch. Over against many of the notches are placed on the left hand several marks or symbols, denoting the golden number or cycle of the moon. The festivals are marked by symbols of the several saints issuing from the notches. Some are perfect, containing the dominical letters as well as the prime and marks for the feast, engraven upon them, and such are our primestaves in the museum at Oxford; others imperfect, having only the prime and the immovable feasts on them, and such are all those I met with in Staffordshire; which yet are of two kinds also, some public, of a larger size, which hang commonly here at one end of the mantle-tree of their chimneys, for the use of the whole family; and others private, of a smaller size, which they carry in their pockets." Examples of the C. A. may be seen in the British museum (one cut apparently towards the end of the 17th c.); in the Ashmolean museum, and the Bodleian library, at Oxford; in St. John's college, Cambridge; and in the Cheetham library, at Manchester. The Flemish antiquary, Gruter, delineates one at Rome, which he believes to have been used by the Goths and Vandals; but there is no reason to suppose that the C. A. was known to any European nation before its conversion to Christianity. It is described by the Swedish historian, Olaus Magnus, in the 16th c.; and by the Danish antiquary, Olaus Wormius, in the 17th c. It has been found in France and elsewhere. In Denmark it seems to have been generally flat, divided into six columns; but six-sided examples are not unfrequent. Some of the clog almanacs show a peculiar numerical notation. The first four digits are marked by dots; the fifth, by a sign like the Roman numeral V; the next four, by this sign and additional dots; and the tenth, by the sign +.

CLOGHEEN', a t. in the s.w. of Tipperary co., 14 m. w.s.w. of Clonmel, in lat. 52° 17′ N., and long. 7° 57′ W. Pop. '71, 3,176. The rich limestone soil of Tar vale produces fine wheat crops, and there are extensive flour-mills here. Six m. n.w. of C. are the famous limestone caves of Mitchellstown, with beautiful limestone concretions. The caves consist of galleries and vaults, 800 by 570 feet.

CLOGH'ER, a decayed episcopal city of Ireland, in the south of Tyrone, on the Launy, a tributary of the Blackwater, 104 m. n.n.w. of Dublin. The see is now united

to that of Armagh. St. Patrick is said to have been the first bishop of C., in 444. Pop. '71, 1515.

CLOISTER (Fr. *cloître, claustrum*, an enclosure), a covered passage, or ambulatory, running round the walls of certain portions of monastic and collegiate buildings. The C. usually surrounded, or ran along three sides of a quadrangular area, which was called the *C. garth*. The roof of the C., which was often vaulted, was supported on the side next to the quadrangle by pillars and arches, which were frequently ornamentally combined like trifolial arches, and, like them, occupied by tracery. The upper portions of these arches above the mullions were often glazed; and sometimes latterly even the whole arches, so that they became a row of windows, as at Gloucester. Cloisters were used for exercise and recreation by the inmates of the religious houses. Occasionally, when wholly glazed, they had cells or stalls for study on the inner side; and very frequently a stone-bench may still be seen, which runs along the same side. Many of the larger monasteries had more cloisters than one; and so characteristic were they of the religious houses, that the term C. came to be used in a general sense for the whole establishment, which is still the sense of the word *kloster* in German. See MONASTERY.

CLONAKIL'TY, a t. in the south of Cork co., Ireland, at the head of a small inlet, 26 m. s.w. of Cork. Its chief export is grain. Pop. '71, 3,568.

CLONES, a market t. of Ireland, in the co. of Monaghan, 12 m. w. from the t. of that name. It is situated on a rising ground on the high-road between Monaghan and Belturbet, and near the Ulster canal, and is in general well built, and has some ancient remains, including the ruins of a monastery, dating, it is said, from the 5th c., and of a round tower. It has manufactures of linen, corn mills, and a brewery, and is the seat of a poor-law union. Pop. '71, 2,170.

CLONMEL' (Vale of Honey), a parliamentary and municipal borough in the s. of Tipperary co., with a little in Waterford, on both banks of the Suir, and two islands. 14 m. s.s.e. of Cashel. It chiefly stands on the Tipperary side of the Suir, and on one of the isles in the river. One of the bridges over the Suir has 20 arches. The main street is a mile long, and parallel to the river. Pop. '71, 10,112, of whom 8,729 are Roman Catholics, 1,119 Protestant Episcopalians, and the rest of other denominations. C. returns one member to parliament. It has manufactures of cotton, and large flour-mills. The chief exports are agricultural produce and cattle. Barges of 20 to 50 tons ply on the Suir to Waterford. C. had formerly walls, of which one gate remains. In 1650, Cromwell besieged the town, and demolished the castle. C. gave birth to Sterne and Lady Blessington, and was the chief scene of O'Brien's attempted rising in 1848. Here Mr. Bianconi first established the cheap and rapid car traveling over the southwest of Ireland; and C. is now a great center for Irish tourists.

CLONTARF', a t. of Ireland, in the co. of Dublin, about 3 m. e.n.e. of Dublin city. It is much frequented during the summer months for sea-bathing, and there are many handsome villas in the vicinity. C. is celebrated in history as the place where, in 1014, Brian Boroimhe (q.v.) won a great victory over the Danes. Pop. '71, 3,442.

CLOOTS, JEAN BAPTISTE, Baron, better known as Anacharsis Cloots, was perhaps the most singular of all the enthusiasts brought to the surface of society by the French revolution. He was born near Cleves in 1755, and from his 11th year was educated in Paris. Through ardent study of the ancients, his imagination, naturally extravagant, became so heated with the political constitutions of Greece, that he undertook the mission of spreading the democracy of Sparta and Athens throughout the world; and with this view he traveled through most of the countries of Europe, under the name of Anacharsis, everywhere expending upon his philanthropic schemes large sums of his very considerable private fortune. The union of all nations in one family was the ultimate aim of all his cosmopolitan schemes. The breaking out of the French revolution brought his enthusiasm to a head, as he saw in it the fulfillment of his dreams and plans. He returned to Paris, constituted himself the "orator or advocate of the human race," and presented numerous petitions to the national assembly. On the 19th of June, 1790, he appeared at the bar of the assembly at the head of a number of strangers, dressed in the costumes of different nations, as the representatives of the whole earth, and presented an address of thanks for the stand made against the tyrants of the world, and a request that all the strangers then in Paris should be made French citizens. As a member of the constituent assembly, he offered to raise a Prussian corps, to be called the vandal legion; proposed to lay a price on the head of the duke of Brunswick; called the king of Prussia the Sardanapalus of the north; and eulogized count Ankarstrom for having assassinated the king of Sweden. What is singular is, that these extravagances were received often with storms of applause. He called for the apotheosis of Gutenberg in the Pantheon, as the "creator of the word," and also for that of an apostate priest. On the occasion of the general armament of France, he deposited 12,000 francs on the altar of the country. In 1792, he was elected a member of the convention, and continued to weary the house with his extravagant motions. He hated Christianity no less than royalty; declared himself the enemy of its founder; and, as an adherent of the worship of reason, preached downright materialism. At the trial of Louis XVI. he gave his vote for death "in the name of the human race," and took occasion at the same time to pass

sentence on the king of Prussia. Some time after, on the motion of Robespierre, he was excluded from the club of the Jacobins, on the ground that he was wealthy and a nobleman. Robespierre hated and feared the enthusiast; and when St. Just brought his impeachment against Hebert and his adherents, C. was involved in it, and was condemned to death, and executed Mar. 23, 1794. He heard his sentence with the greatest composure, comforted the companions of his fate, and continued to preach materialism to his friend Hebert on the way to the place of execution. At the foot of the scaffold, he requested that his turn might be last, in order that he might have time to establish a few more principles, while the heads of the others were falling. He then laid his head with equanimity on the block, after asserting his innocence, and protesting against his sentence, "in the name of the human race." He left a number of writings, all of the same extravagant character, of which we may mention here *Certitude des Preuves du Mohammédisme* (Lond. 1780); *L'Orateur du Genre Humain* (1791); and *Base Constitutionale de la Republique du Genre Humain* (1793).

CLOQUET, HIPPOLYTE, 1787–1840; a physician of Paris distinguished as a teacher of anatomy. He wrote valuable works on descriptive and comparative anatomy, and on odors and the sense of smell. In his later days, he was afflicted with mental imbecility.

CLOQUET, JULES GERMAIN, b. 1790; brother of Hippolyte, and also a physician and surgeon; eminent especially in the latter science. He was for many years professor of surgery in the faculty of Paris. Among his works are one on the human anatomy, in three volumes, profusely illustrated; others are on hernia, on calculi, and diseases of the urinary organs; on the preparation of skeletons, on the lachrymal apparatus in serpents, and on the anatomy of intestinal worms. He made many new surgical instruments, and invented improved methods of performing operations. In 1860, he received the cross of the legion of honor, and in 1867 was made a baron.

CLOSE, in heraldry. When the wings of a bird are down and close to the body, it is described as close. The term is used only with reference to birds addicted to flight, such as the eagle, falcon, etc. Of dunghill cocks, and other domestic fowls, it is understood that their wings are in this position. Barnacles, and bits for horses, are said to be *close* when they are not to be understood as extended,

CLOSE'-HAULED, in seamanship, is the mode in which the sails are arranged, in order to make the ship move in a direction the nearest possible towards that point of the compass from which the wind blows. Fore and aft vessels, especially cutters, sail closer to the wind than square-rigged ones. Ships of some sizes and shapes can attain this result better than others; but it is a quality scarcely to be calculated beforehand.

CLOSET, in heraldry, the half of the bar (q.v.).

CLOSSE, RAPHAEL LAMBERT, d. 1662; a Canadian pioneer famous for fighting Indians. He came from France in 1642, and was made serg.maj. of the garrison at Montreal. He had many severe contests with the aborigines, on one occasion engaging 300 Iroquois with only 34 men, killing 50 and wounding 37 of them, with the loss of only one man killed and one wounded. In 1655, he acted as governor of Montreal. He was killed in a fight with Indians in 1662.

CLOTAIRE I. AND II., Kings of the Franks. See MEROVINGIANS.

CLOTHES-MOTH, a name common to a number of species of small moths of the genus *tinea*, the larvæ or caterpillars of which are extremely destructive to woolen clothes, furs, stuffed quadrupeds and birds, etc. *Tinea destructor* is one of the most annoying of these insect pests. It is of a satiny buff color, the wings deflexed when at rest. The larva is about a quarter of an inch long, with only a few hairs, white, with a slate-colored line down the back, an ocherous head, and 16 legs. *T. tapezana* has the upper wings black at the base, the rest of the wing white. *T. sarcitella* is another very common species of a silky gray color; the head, thorax, and base of the superior wings white; the wings folded flat on the back when at rest. The larva is covered with scattered hairs. These moths are most abundant in the warmer seasons of the year, but their larvæ carry on their destructive operations even during winter. Guided by instinct, the female moth lays her eggs where the larvæ may find their appropriate food, consisting of substances indigestible to almost every other creature; and the larvæ being furnished with minute but strong and sharp jaws, not only begin to eat as soon as they are hatched, but to cut the fibers of the substances on which they feed into little bits, and to unite them by means of a glutinous silk of their own producing, so as to form for themselves cases, lined internally with silk; and in these they constantly abide, adding to them at the anterior end as their own increase of size requires, and also widening them, by slitting them down the middle, and mending them with additional materials. All this may be beautifully observed by transferring the same moth-larva to different pieces of flannel in succession, of different colors. The larva of *tinea tapezana* works its way through woolen stuffs in an arched gallery, carrying its little case with it. *T. pellionella* makes similar tunnels in furs. *T. granella* is destructive to books as well as to grain. See CORN-MOTH. The best means of preventing the ravages of moths are perfect cleanliness, frequent inspection of articles, and their exposure to light and air. Spirit of turpentine is used

for killing them; the vapor arising from a sponge dipped in this liquid is fatal to such as it sufficiently reaches; they are also killed by the heat of a brisk fire or of an oven.

CLOTHING, ARMY, is one of the departments of the British military system into which, within recent years, much change and improvement have been introduced.

In the time of HENRY VIII., the soldiers' dress was principally white, with green or russet for special corps. In queen Elizabeth's reign, a sum of 1*s.* 8*d.* was allowed weekly for each soldier's clothing. The uniform then consisted of a cassock of Kentish broadcloth, a canvas doublet, kersey stockings, trousers of kersey broadcloth, neat's leather shoes, and holland shirt. In 1678, an infantry soldier's dress was valued at £2 13*s.*, and a dragoon's as high as £6 10*s.* At one time, lords-lieutenant attended to the C. of the troops, each in his own county; but the duty was afterwards transferred to the state. Captains of companies clothed the men, stopped the money out of the pay, and made a profit on the transaction. The privilege afterwards passed to the colonels of regiments. The sum provided by the state every year was for the "effective" strength of the regiment; and any vacancies put an additional sum into the pockets of the colonel. From 1746 to 1855, soldiers' pay was debited with "off-reckonings," as a means of paying for the clothes supplied to the men. Under this system, the colonel received from the state so much money annually for clothing his regiment, and then contracted with wholesale tailors for a supply on the lowest terms. In 1854, just before a change was made in the system, the colonel's profit, on the C. for a private in the line, was 15*s.* 3*d.* per man.

The disasters during the early months of the Crimean war having created a national demand for reforms in military matters, a change in the mode of army C. was one of the results. By a royal warrant, dated June 21, 1855, the colonels of regiments were awarded certain annual sums of money in lieu of off-reckonings. These sums varied from £1200 to £500, and were to be given in addition to the pay. From that date, all the troops have been clothed by the government, the off-reckonings being calculated nearly as before, but paid by the country to the colonels. When the war office was remodeled about the same time, a clothing department was added to it; and it was now found that the C. for a full regiment of 1091 non-commissioned officers and rank and file, in the line, cost about £2,500 per annum. The C. is now contracted for more openly than under the former system; and better materials are hence obtained without any increase in cost. The government has a factory on its own account, but a large part of the supply is obtained by contract. Formerly soldiers' coats were too often made of very loose, spongy materials; but now the inspection is rendered much more severe; and the cloth provided for privates is as good as that worn by sergeants a few years ago, while the cloth worn by sergeants now is correspondingly improved.

The net amount of the parliamentary vote for army clothing in 1877–78 was £805,587 (of which a proportionate part is repaid by the Indian government). The cost of a suit of uniform varies from £2 15*s.* 4*d.* for a private in the line, to £8 15*s.* for a life-guardsman. The issue of new uniforms takes place on the 1st of April of each year. Under some circumstances, the men may receive money instead of C., at a certain price for each garment.

CLOTHING, NAVY. The seamen of the royal navy are provided, while on the ship's books, with C. by the government; but a certain sum is subtracted from their pay, to defray the greater part of the cost. The navy estimates group "victuals and clothing" together. The total vote under this head for the year 1877–78 amounted to £1,178,610, of which sum £344,742 was the amount allotted to thus provide clothing for the fleet, the coast-guard service, etc. Cast-off seamen's C. is among the "marine stores" sold by auction every year by the admiralty. In 1859, when there was a strong desire to facilitate the manning of the navy, the admiralty offered improved terms to sailors who would enter the royal service; and among other items, the following arrangements were made in reference to C.: "To every man on his first entering the navy for ten years' continuous service, and to all boys on being advanced to man's rating, a suit of clothes consisting of the following made-up articles to be furnished free of charge: A blue cloth jacket (No. 2 cloth), 17*s.* 8*d.*; a pair of blue cloth trousers, do., 11*s.* 7*d.*; a blue serge frock, 8*s.* 6*d.*; a duck frock, 2*s.* 9*d.*; a pair of duck trousers, 2*s.* 7*d.*; a black silk handkerchief, 2*s.* 10*d.*; and a pair of shoes, 6*s.* 7*d.* In the case of a seaman being already provided with clothes approved by his captain, a corresponding amount in money is to be placed to his credit." The above figures will about show the market-value of the usual kinds of seamen's clothing.

CLO'THO, a genus of spiders, of which the only known species, *C. quinquemaculata*, a native of the s. of Europe and n. of Africa—about half an inch long, long-legged, brown, with black abdomen, marked with five yellowish spots—is interesting on account of its habits and the sort of tent which it spins for itself. This curious structure is in shape like a limpet shell, about an inch in diameter, and is fastened to the under side of stones or in crevices of rocks, not by its whole circumference, but by seven or eight points only. Within this the eggs are deposited in several bags of lenticular form. The parent creeps in and out under the edges of her tent, and supplies the young with food for some time.

CLOTHO, one of the three Moiræ, Parcæ, or Fates; daughter of Erebus and Nox, or of Jupiter and Themis. She was the youngest of the dreaded sisters, and her symbol was a distaff, from which she was supposed to spin the threads of mortal life. By some she is represented in a parti-colored robe, wearing a crown with seven points or stars.

CLOTILDA, Saint, 475–545; a daughter of Chilperic, king of Burgundy, and wife of Clovis, king of the Franks. Her father, mother and brothers were murdered by Gundebald, her uncle, but he spared and educated her. He opposed her marriage with Clovis, but she eluded him and was wedded, and converted the Frank king to the Roman Catholic religion in 496. He avenged the murder of her family, and made Gundebald his tributary. After the death of Clovis, Clotilda persuaded her sons to renew the quarrel, and a war followed which ended with the union of Burgundy to the Frankish empire. Clotilda then retired to Tours, and practiced the austerities of a devotee until her death. She was buried in the church of St. Genevieve, which her husband had built in Paris, and was canonized a few years afterwards. During the revolution a devout abbe, fearing that her remains might be desecrated, had them exhumed and burnt, and the ashes are now in an urn in the church of St. Leu. There is a statue of her in the Luxembourg, and a fine church in her honor was built in Paris a few years ago.

CLOUD, a co. in n. Kansas on Republican and Solomon rivers; 720 sq.m.; pop. 80; 15,346. The productions are almost entirely agricultural. Co. seat, Concordia.

CLOUD, St., a t. of France, in the department of Seine-et-Oise, situated on the declivity of a hill near the Seine, 5 m. w. of Paris. Its present name is said to be a corruption of St. Clodoald, the name of a grandson of Clovis, who retreated to the little village of Novigentum, to escape the fury of his uncle, Clotaire, and became a monk. After his death, the village took the name of the pious prince, whose relics were sacredly preserved, and whose tomb was the scene of many miracles. St. C. figures often in the wars of the middle ages. Henry III. was assassinated here in 1589, by the fanatical monk Jacques Clement. St. C. was long famous on account of its magnificent château, built by Mazarin, and embellished by successive dukes of Orleans, who possessed it till 1782, when it passed into the hands of Marie Antoinette. Here Bonaparte, in 1799, was named first consul; and in this place Charles X. signed the ordinances which produced the revolution of 1830. But during the siege of Paris, on the 13th Oct., 1870, the château was set on fire and almost entirely destroyed by the French artillery from mont Valerien; apparently because it was supposed to be the head-quarters of the German staff. Pop. '76, 4,747.

CLOUD'BERRY, *Rubus chamæmorus*, a plant of the same genus with the bramble, although of very different appearance, having a herbaceous single-flowered stem destitute of prickles. The plant is of humble growth, 8 to 10 in. in height; the leaves few, large, lobed, and somewhat kidney-shaped; the flower large and white, male and female flowers on separate plants, the female plant producing an orange-red fruit equal in size to a bramble-berry, and of an agreeable flavor. It is a native of the northern parts of Europe, Asia, and America. In Britain, it is chiefly confined to elevated moors; in Norway and Sweden, it is much more abundant, and the fruit is highly valued and made into excellent preserves. Unfortunately, the plant is of difficult cultivation, and no attempt to make it produce fruit freely in our gardens has yet been successful.—Somewhat similar to the C. is *rubus geoides*, which yields a very agreeable fruit as large as a raspberry, one of the few native fruits of Terra del Fuego and the Falkland islands.

CLOUDS are masses of fog, consisting of minute particles of water, often in a frozen state, floating in the atmosphere. When air saturated, or nearly so, with vapor, has its temperature lowered, either by ascending and becoming rarer, or by meeting a colder current, a portion of the vapor loses its gaseous form, and becomes condensed into minute specks of water. See Evaporation, Dew, Rain, Snow-line. A cloud, therefore, does not consist of vapor, in the proper sense of the word, but of water in the form of dust, as it were. How this water-dust is suspended in the atmosphere—why the particles do not descend as soon as formed, has never been satisfactorily explained. It has been assumed that the watery particles are hollow, like blown bubbles. But there is no proof of this; nor would the hollowness of the particles account for their floating, unless it could be shown that they must be filled with a gas lighter than the surrounding air. Prof. G. G. Stokes holds that they are prevented from falling mainly by the friction and drag of the air-particles, just as fine powders remain suspended in liquids of much less specific gravity than themselves. But, as sir J. Herschel says, rising and horizontal air-currents must also oppose the fall of C.; for at night, in the absence of rising currents, they often descend to and dissolve in lower and warmer levels. The conditions under which C. are formed, and afterwards deposited in rain, are more fully considered under Evaporation, Dew, Rain, Snow-line. The present article is confined to a description of the various kinds of C., and of the weather they indicate.

A general haze of precipitated vapor covering the sky, and coming down to the earth is termed a *fog* or *mist;* and the term cloud is usually confined to masses of fog floating

in the higher regions, and not descending to the ground. They are mostly within a mile of the earth's surface; and none are more than 5 or 6 m. above it. They rise higher in the equatorial regions than towards the poles. C. spread and move with the wind in varied, often grand forms; they are generally disposed in beds parallel to the earth's surface; vertical C. occur rarely, if at all.

Mr. Luke Howard's classification of C., proposed in 1802, into three primary forms —cirrus (Ci.), cumulus (Cu.), and stratus (St.); three intermediate—cirro-cumulus (Ci.-cu.), cirro-stratus (Ci.-st.), and cumulo-stratus (Cu.-st.); and one compound form, nimbus (Ni.) —has been universally adopted, and holds good in all climates and atmospheric conditions.

Cirrus, or curl cloud, consists of parallel, curling, flexuous, diverging, and partly straight fibers, increasing in any or in all directions by elongation, branching, or addition of new fibers. It is the highest and least dense of C.; forms at least 3 m. above the earth; varies most in extent, direction, and shape; retains longest its varied outlines; and is the longest illuminated after sunset and before sunrise. It resembles a mare's or cat's tail, a lock of hair, fine trellis-work, or thin silvery streaks, and it may cover all the sky. Cirri seem to arise from the mixing of parallel air-currents, or are the relics of dissolving clouds drawn out in fibers by wind. Threads and groups of Ci., during gentle wind after severe weather, presage serene settled weather. But after a long tract of fair days, whitish filaments or parallel bands of Ci. crossing the sky, with the ends converging by perspective in each horizon, and traveling longitudinally, though seemingly stationary, foretell a change to wet. Ci., being so high, must consist of minute snow crystals, whose refractions and reflections produce the halos, coronæ, and mock suns and moons almost restricted to this cloud and its derivatives the Ci.-st. and Ci.-cu. The fibers often wave back and fore, or to and from each other. Ci., especially with fine tails, varying much in a few hours, presage rain or snow, and windy variable weather.

Cumulus, ball of cotton, day or summer cloud, consists of dense, convex, hemispherical, or conical heaps of small roundish C., piled or stacked on each other. The heaps enlarge upwards from a horizontal base, and have crenated tops; they sometimes unite into stupendous white-topped mountains. It forms, says sir J. Herschel, in summer calms by the rise of columns of vapor from marshes, lakes, and rivers, into the colder and quickly saturable lower regions of the air; for one liquid traverses another in cylinders. Cumuli begin after sunrise as a few scattered specks in the clear sky; these specks enlarge and unite to form C., which often nearly cover the sky in the afternoon, and generally decrease and vanish about sunset; but rain follows if they increase in number and darkness in the evening. Their tops become Ci. in very dry air. Cu., of pleasing forms, dispositions, and colors, and of moderate size, presage fine dry warm and calm days; but cold, rain, and tempest follow dark, abrupt, dense, shaggy Cu., covering the sky, and rolling on each other. Hemispherical silvery white Cu. presage thunder.

Stratus, fall or night-cloud, the lowest of C., is a widely extended, horizontal sheet, of varied thickness, of white mist touching or near the earth. In density it is between Ci. and Cu., and it increases from below. It is common in summer and autumn often from sunset to sunrise, and is densest at or after midnight. It arises in calm clear evenings, after warm days; from the cooling of moist air on damp ground, marshes, lakes, rivers, or from the cooling of moist air mixed with smoke enveloping great cities. From a height, it is seen spreading around like a sea, and creeping up hillsides. After sunrise, it rises from the ground, breaks up into Cu., and vanishes with the increasing heat, to be followed by a serene day; but it may quietly accumulate in layers, and become a Ni. It does not wet objects it touches, and thus differs from a variety of Ci.-st. of like external aspect.

Cirro-cumulus, or sonder-cloud, consists of Ci. sinking in the air, and compressed into dense roundish-white cloudlets, or woolly irregular tufts, generally at great heights. It often forms a beautiful sky in beds like flocks of sheep at rest. It is often seen through breaks in lower C., moving differently. It may vanish or pass into Ci. or Ci.-st. Solar and lunar coronæ appear in it. It occurs in warm dry weather, and between summer showers, and presages increased heat. Ci.-cu. very dense, round, and close, and with Cu.-st., presages a storm or thunder. In winter, it precedes a thaw and warm wet weather.

Cirro-stratus, or vane-cloud, consists of long, thin, horizontal clouds, with bent, or undulated edges. It often resembles shoals of fish, or has a barred appearance—the mackerel-backed sky. It alone, or with Ci.-cu., forebodes rain, snow, and storm. Waved Ci.-st. generally attends heat and thunder; it often forms an extended shallow bed or thin veil, through which the sun and moon shine faintly. This variety oftenest presents the finest solar and lunar halos, parhelias and paraselenes, and it is the surest prognostic of rain and snow.

Cumulo-stratus, or twain-cloud, is a Ci.-st. mixed with Cu. heaps, or a wide flat base surmounted by a bulky Cu., with fleecy protuberances or rocky and mountain masses. It resembles a thick-stemmed fungus, with a flat, anvil-shaped, or cirrose top. It is much denser than Cu., though the air is not dry enough to round off sharply its tops. It often forms vast banks of cloud, with overhanging masses. It is common towards night in dry windy weather, when it has a leaden hue. It generally arises from Cu. becoming

denser, wider, and protruding in large irregular projections over the base. It tends to overspread the sky, and partly or wholly to become Ni., and to fall in showers. Cu.-st. is intermediate between clouds indicating fair, and those indicating rough, rainy weather, and attends sudden atmospheric changes. Distinct Cu.-st. forms before thunder. Cu.-st. increases the grandeur of mountain scenery, and drops on and envelops mountain-tops like a curtain.

Nimbus, or cumulo-cirro-stratus, the black rain-cloud, is a cloud or mixed system of clouds, ending in showers of rain, snow, or hail. It is a dense, continuous, horizontal black or gray sheet, with fringed edges, a cap of Ci., and Cu. on the sides and below. Before rain, vast towering masses of Cu. often pass into Cu.-st., which, increasing in density, darkness, irregularity, and extent, become Ni. capped by Ci.-st. Thunder-storms are always accompanied by ni. in its most perfect form.

The term *scud* has been applied to loose vapory fragments of C. driven by wind, and *cumulonus* to shaggy cumuli.

The formation and height of C. vary with the quantity of vapor in the air, the course and height of air-currents, the climate, season, temperature, disposition, and extent of sea and land, and the height of land. Cloud-strata on the Pyrenees vary in average thickness from 1600 to 3,400 feet. The lower surfaces of considerable masses of clouds in all climates are probably 2,500 to 3,000 ft. above the earth. Remarkable cloud-rings prevail over the calm zones of the equator, and over those of Cancer and Capricorn. Clouds, viewed from above in bright sunshine by the aëronaut or mountaineer, appear as dense volumes of steam or masses of white cotton. Kaemtz regards the usual height of Ci. as 10,000 to 24,000 ft.; Cu., 3,000 to 10,000; Ni., 1500 to 5,000; but Ci. may descend to 2,000 or 3,000 ft., and Ni. to within a few hundred ft. of the earth.

C. moderate the sun's rays during day, and the earth's radiation during night. They always exhibit positive or negative electricity, but of greatest tension in thunder-storms. They are the sources of the moisture required by plants; of the water of springs, lakes, and rivers; and of the polar, glacial, and winter snows, which cover temporarily or permanently parts of the earth.

In Britain, six or seven tenths of the sky is on an average daily obscured by clouds. There is most cloud in winter, and about midday, and least in May or June, and during night. Summer and autumn nights are freest of clouds. All the forms of C. may be seen in one day, often very much commingled.

CLOUDY BAY. See NEW ZEALAND.

CLOUGH, ARTHUR HUGH, 1819–61; the son of a cotton trader of Liverpool, who emigrated to Charleston in 1823. The boy went back to England in 1828, and was educated at Rugby and Oxford, becoming a tutor in Orriel college. He resigned in 1848, and in 1852 visited the United States, where he made the acquaintance of Emerson, Longfellow, and other literary men. On his return the next year, he was appointed examiner in the education office of the privy council. Afterwards he traveled in Europe, and was on a tour in Italy when he died suddenly of a fever. His poems are his principal works. He revised Dryden's translation of Plutarch's *Lives*, and wrote a series of tales under the title *Mari Magno*.

CLOUTED or CLOTTED CREAM is obtained by heating milk in a shallow wide pan on a hot plate or over a slow charcoal fire. The milk must be strained, as soon as it comes from the cow, into the pan, where it must stand for 24 hours before heating. It usually takes from half an hour to three quarters of an hour to heat the milk completely; but it must not boil. It then stands for 24 hours, when the cream is skimmed off, and a little sugar thrown on the top. The result is C. C., which, mixed with new milk, is eaten with strawberries, raspberries, tarts, etc. Devonshire is famous for its clouted cream.

CLOVE-BARK, another name for culilawan bark (q.v.).—Another bark which occurs in commerce under the name of C. B. is that of the *myrtus caryophyllata*, a native of Ceylon and the Mascarene isles. It is in sticks 2 ft. long, formed of several pieces of very thin and hard bark, rolled up one over the other, of a deep brown color, and of a taste similar to that of cloves. It possesses properties analogous to those of cinnamon.

CLOVER, or TRE'FOIL, *Trifolium*, a genus of plants of the natural order *leguminsæ*, sub-order *papilionaceæ*, containing a great number of species, natives chiefly of temperate climates, abounding most of all in Europe, and some of them very important in agriculture as affording pasturage and fodder for cattle. The name C. is indeed popularly extended to many plants not included in this genus, but belonging to the same natural order, and agreeing with it in having the leaves formed of three leaflets, particularly to those of them which are cultivated for the same purposes, and sometimes collectively receive from farmers the very incorrect designation of *artificial grasses*, in contradistinction to *natural grasses*, i.e., true grasses. See MEDICK and MELILOT. The true clovers (*trifolium*) have herbaceous, not twining stems; roundish heads or oblong spikes of small flowers; the corolla remaining in a withered state till the ripening of the seed; the pod inclosed in the calyx; and containing one or two, rarely three or four seeds. About 17 species belong to the flora of Britain. The most important of all to the British farmer is the COMMON RED C. (*T. pratense*), a native of Britain and of most parts of Europe, growing in meadows and pastures. It is a perennial, but is generally

treated as if it were a biennial. Its heads of flowers are oval or nearly globular, very compact, about an inch in diameter, purple, more rarely flesh-colored or white; the tube of the calyx is downy; the stipules run suddenly into a bristly point. The leaflets have very often a whitish horseshoe mark in the center. This plant was formerly reputed very noisome to witches; knights and peasants wore the leaf as a potent charm against their arts. It is supposed that C. found its way into England from the Netherlands about the time of queen Elizabeth; but it was not until the close of the last century that it was introduced into Scotland, where it is now universally prevalent. The ZIGZAG C. (*T. medium*), also called MEADOW C., MARL-GRASS, and COW-GRASS, much resembles the common red C., but is easily distinguished by the smooth tube of the calyx, and by the broader, less membranaceous, and gradually acuminated stipules. The stems are also remarkably zigzag, and more rigid than in *T. pratense;* the heads of flowers are larger, more lax, more nearly globose, and of a deeper purple color; and the leaflets have no white spot. It is a common plant in Britain and most parts of Europe.—WHITE or DUTCH C. (*T. repens*) is also a common native of Britain and of most parts of Europe. When a barren heath is turned up with the spade or plow, white C. almost always appears. It is said to be a native also of North America, where, however, it is perhaps only naturalized. The flowers of all kinds of C. are the delight of bees, but those of this species perhaps particularly so.—ALSIKE C. (*T. hybridum*), a perennial, regarded as intermediate in appearance between the common red C. and the white C., has of late attained a very high reputation. It was introduced into Britain from the s. of Sweden rather more than twenty years ago.—CRIMSON C., or ITALIAN C. (*T. incarnatum*), an annual, native of the s. of Europe, with oblong or cylindrical spikes of rich crimson flowers, is much cultivated in France and Italy, and has of late been pretty extensively grown in some parts of England, producing a heavy crop.—MOLINER'S C. (*T. Molineri*) very much resembles crimson C., but is biennial, and has pale flowers. It is cultivated in France and Switzerland.—ALEXANDRIAN C., or EGYPTIAN C. (*T. Alexandrinum*), an annual species, a native of Egypt, universally cultivated in its native country, where it is the principal fodder for cattle, has been tried in Britain, but the colder climate has been found to render it less luxuriant and productive. It is supposed to be one of the best kinds of C. for many of the British colonies. It has oval heads of pale-yellow or whitish flowers.—YELLOW C., or HOP TREFOIL (*T. procumbens*), is very common in dry gravelly soils in Britain, but not much esteemed. It has smaller leaves and heads of flowers than any of the cultivated species. The flowers are yellow.

It is little more than a century since clovers were introduced into field-culture in Britain. They are now universally cultivated on large farms in alternation with grain crops. The kinds most generally sown are the *common red, cow-grass, Dutch white, yellow,* and *alsike.* The *common red* is the finest and most valuable, but it is difficult to grow unless on naturally rich soils. In America it grows well on sandy loams, though sown every alternate year on the same land. But in Britain the land is thought to become "clover-sick" when sown too frequently with this crop. An interval of not less than eight years is thought advisable. From 6 to 20 lbs. of seed per acre is the quantity sown. Red C. is most esteemed for being mixed with rye-grass for the making of hay. When it grows well, it bears to be cut more than once a year. *Cow-grass* much resembles the common red C. It is coarser but hardier, and better suited for pasture, as it bears more herbage, and comes better up after being eaten close down by stock. *Dutch white C.* is only esteemed for pasture; it grows short and thick on the ground, but throws out fresh stems and flowers during the most of the growing season. In the s. of England, it is sometimes sown with but little rye-grass seed along with it; in Scotland, as much as a bushel or a bushel and a half of rye-grass is mixed with it for pasture. *Yellow C.* is chiefly sown on ground where neither the white nor red grows freely. It is not sown so frequently as it probably ought to be, for it rises early in spring, and a mixture of it with other clovers forms good pasture on all grounds. *Alsike C.* has been recently introduced; it rises much higher than white C., and offers to be a useful addition to our pasture-plants. Land must be thoroughly cleaned of perennial weeds before it is sown with C., as the land cannot be subjected to cultivation while it is under this plant; C., therefore, is always sown in the end of the rotation, or as near the fallow or turnip crop as possible. It is sown early in spring among the winter-wheat, or with the barley crop, and slightly harrowed in; for the seeds being small are not difficult to bury. Farm-yard manure is as good as any for clovers. A well-manured soil greatly assists in keeping the plants from dying out in spring. Clovers, like grasses, play a most important part in restoring fertility to land which has been exhausted by grain-crops. Their leaves gather food—carbonic acid and ammonia—from the atmosphere, which they store up in their roots and stems; and these, on decomposing, afford food for cereals or other crops which are more dependent on a supply within the soil.

The caterpillars of a number of species of moth feed on the leaves of different kinds of C.; but the insects most injurious to the C. crops are weevils of the genera *apion* and *sitona.* See CLOVER-WEEVIL and PEA-WEEVIL.

CLO'VER-WEE'VIL, *Apion,* a genus of small pear-shaped weevils (coleopterous insects, section *tetramera,* family *rhynchophora*), different species of which feed on the leaves, and their larvæ on the seeds of clover, some also on those of tares and other leguminous plants. Like the other weevils, the perfect insect has the head very much

elongated into a sort of muzzle. *A. apricans* often does much injury to fields of common red clover, particularly interfering with the production of seed. It lays its eggs among the flowers, and the little grubs eat their way through the calyx into the pod. It is of a bluish-black color, little more than a line long. *A. flavipes* is attached in like manner to white clover, and other species of clover have their particular weevils.

CLOVES (Fr. *clou*, a nail) are the flower-buds of the clove-tree (*caryophyllus aromaticus*). The genus to which this tree belongs is of the natural order *myrtaceæ;* the calyx has a cylindrical tube and 4-cleft border; the corolla consists of four petals united by their tips; the stamens are in four clusters; and the fruit is an oblong dry berry with one or two cells and as many seeds. The clove-tree is from 15 to 40 ft. high, with a beautiful pyramidal head. The leaves are large, ovate-oblong, acuminated at each end, evergreen: the flowers are small, but produced in great profusion in cymes. Leaves, flowers, and bark have an aromatic odor. The ripe fruit in shape resembles an olive, but is not quite so large; it is of a dark-red color; it sometimes appears in commerce in a dried state, under the curious name of *mother cloves;* it has an odor and flavor similar to C., but much weaker: the broken fruit-stalks are sometimes also used for the same purposes as C.; but the flower-buds themselves are the principal product of the tree. They are gathered, and are dried by exposure to the smoke of wood fires, and afterwards to the rays of the sun, or by the latter alone. When first gathered, they are reddish, but become of a deep-brown color. The unexpanded corolla forms a little round head at the end of the calyx tube, which is about half an inch long, and thus the appearance is not unlike that of a little nail, whence the name. The clove-tree is a native of the Moluccas, and the Amboyna C. are still esteemed the best; but the tree is now cultivated in Sumatra, Bourbon, Mauritius, and some parts of the West Indies, and will probably soon be common in many other tropical countries. The Dutch, in order to secure to their own colonists a monopoly of the trade in this spice, destroyed the trees in the other Molucca islands, and confined the cultivation of them to the isle of Ternate. It is not deemed quite certain that C. are the *karyophyllon* of the ancient Greeks; but before the discovery of the Spice islands, eastern merchants brought them from Arabia, Persia, and Egypt, to the harbors of the Mediterranean, from which the Venetians and Genoese diffused them over Europe.

The wild clove-tree of the West Indies is *myrcia acris*. See MYRCIA.

The properties of C. depend chiefly on an essential oil, *oil of C.*, which forms one fifth or one sixth of the whole weight. They are used for flavoring dessert dishes and articles of confectionery. They have a hot taste and a characteristic odor. The oil of C. is obtained by repeatedly distilling C. with water, when two oils pass over, one of which is lighter and the other is heavier than water. The oil has a hot acrid taste, is of a light yellow when pure, and brown red when not so carefully prepared. It has a well-known odor, and is soluble in ether, alcohol, and the fixed oils. It is useful in medicine to check nausea and griping, caused by the administration of purgatives. It is also employed in the scenting of soap, and by the distiller. *Tincture of C.* is obtained by treating C. with alcohol for several days, and then straining, or by a solution of the oil of C. in spirits of wine. It is added, in medicine, to stomachic, tonic and purgative mixtures

CLOVIS (old Ger. *Choldwig*, i.e., "famous warrior;" modern Ger. *Ludwig*, Fr. *Louis*), king of the Franks, was b. 465 A.D., and by the death of his father, Childeric, became king of the Salian Franks, whose capital was Tournay. His first achievement was the overthrow of the Gallo-Romans under Syagrius, near Soissons. He then took possession of the whole country between the Somme and the Loire, and established himself in Soissons. In 493, he married Clotilda, daughter of a Burgundian prince. His wife was a Christian, and earnestly desired the conversion of her husband, who, like most of the Franks, was still a heathen. In a great battle with the Alemanni, at Tolbiac, near Cologne, C. was hard pressed, and as a last resource, invoked the god of Clotilda, offering to become a Christian, on condition of obtaining a victory. The Alemanni were routed, and on Christmas day of the same year, C. and several thousands of his army were christened by Remigius, bishop of Rheims. Most of the western Christian princes were Arians, but C. was strictly orthodox, and, in consequence, was saluted by pope Anastasius as the "Most christian king." In 507, love of conquest concurring with zeal for the orthodox faith, C. marched to the s.w. of Gaul against the heretic Visigoth, Alaric II., whom he defeated and slew at Vouglé, near Poitiers, taking possession of the whole country as far as Bordeaux and Toulouse; but was checked at Arles, in 507, by Theodoric, king of the Ostrogoths. C. now took up his residence in Paris, where he died in 511. His great aim was the subjugation of all the Frankish princes, and the union of the whole Frankish people into a single powerful kingdom. The means he employed to secure this end were cruel and unscrupulous, but the end itself would have been very beneficial, if he had not frustrated it at his death by redividing the newly organized realm among his four sons, and exposiug it to the very perils from which he himself had rescued it.

CLOWES, JOHN, 1743–1831; an English clergyman, one of the first followers of Swedenborg in England. He translated the *Arcana Cœlestia*, and published *Restoration of the Pure Religion*, and two volumes of sermons.

CLOWES, WILLIAM, 1779–1847; the first English printer to use steam presses (in 1823). He was the printer and publisher of the *Penny Magazine* and the *Penny Cyclopædia*. The establishment founded by him in London is still one of the largest in England.

CLOYNE, an ancient episcopal t. in the s.e. of Cork co., 15 m. e. by s. of Cork. The see was founded in the 6th c. by St. Colman, the abbey in 707, and the cathedral in the 13th century. Near the cathedral is a round tower, 92 ft. high. About 1430, the see was united to that of Cork, separated in 1678, and reunited in 1835. There are valuable marble quarries near. Berkeley was b. here, and was bishop of C. in 1678. Brinkley, the astronomer, was also bishop of Cloyne. Pop. in 1861 was 1713, but in 1871 had fallen below 1500.

CLUB. The word is probably allied to *cleave* (Ger. *kleben*), "to adhere," so as to form one body or mass. Among other significations, it is used to mean a company or association met for some common purpose, whether of hilarity, literature, politics, or economy. C., in its usual English acceptation, means a body of persons meeting for social or recreative purposes, and consisting of members belonging for the most part to some one class or occupation. Occasionally, other meanings are given to the word. Societies for political objects are sometimes called clubs; and *benefit clubs* are another name for *benefit societies*. What is known as club-life, as exhibited in London, had its origin in the days of Elizabeth, when the Mermaid tavern, in Fleet street, enlivened by the wit and wisdom of Shakespeare, Raleigh, Ben Jonson, Beaumont, and Fletcher, became the home of a sort of club. Ben Jonson afterwards founded a second C. at the Devil tavern, in the same street. Such clubs were meetings for social recreation, to which all were welcome who could bring wit and humor with them. In subsequent reigns, meetings of a similar racy character were very frequently held in taverns, but without much club formality. In last c., Brooks' and White's clubs, and a few others named after the proprietors of the houses in which the meetings were held, were established by politicians of opposite parties, as the headquarters for parliamentary tactics.

The modern clubs of London, in which the *restaurant* or dining-room is an important feature, arose after the termination of the great war in 1815. Many naval and military officers, being no longer needed for war, were placed upon half-pay; and this half-pay was insufficient to support them without careful economy. If they could dine together at a C., it would be cheaper than if each maintained a separate establishment. Hence originated the United Service C.; and the success of this speedily led to the founding of others for different classes of society, and for persons of different political opinions. At the present time, there are about 100 such clubs in the metropolis, of which the following may be named: Alpine, Army and Navy, Arthur's, Athenæum, Brooks', Carlton, Civil and Military, Conservative, East India United Service, Garrick, Guards', Junior Carlton, Junior United Service, Naval and Military, New University, Oriental, Oxford and Cambridge, Reform, Travelers', Union, United Service, United University, White's, Whitehall, and Windham's. All these, and some of the others, combine the *tavern* system with the *club* system. There are also about 20 workingmen's clubs. Clubs are not confined to the metropolis.

Each principal C. comprises a certain definite number of members; it may be, for instance, 500, 1000, or 1500, and this number cannot be exceeded without a formal change in the rules. In some clubs, the managing committee are empowered to admit distinguished persons to membership; but the general mode of admission is by ballot, each member having a vote. In some clubs, one single black ball or "No" suffices to exclude a candidate; but, generally, the rules are not so stringent. The members pay a sum of money on entrance, and then an annual subscription—the amounts varying much in different clubs. The entrance-money may be required as capital, to assist in building the club-house, etc.; while the annual subscriptions, after paying current expenses, leave a surplus for future contingencies. The more important clubs comprise morning or news-rooms, libraries, coffee-rooms, dining-rooms, drawing-rooms, and a very complete culinary establishment. There are no arrangements for the members to sleep at the club-houses; except at certain establishments called club-chambers, which, however, are not properly clubs. Some of the clubs are furnished with bath-rooms, card-rooms, billiard-rooms, and smoking-rooms. The *restaurant* department is usually very complete; everything is of the best, and is supplied to the members as nearly as can be at prime cost. In nearly all the clubs, hard drinking is discouraged. It has been ascertained at two or three of them, that the average cost of dinners is about half-crown, and that the wine scarcely exceeds half a pint to each diner.

It may here briefly be mentioned, that some of the club-houses rank among the most elegant modern buildings in London. The Carlton, the Reform, the Conservative, and the Army and Navy club-houses are especially to be named in this respect.

Before the first revolution, it was attempted to get up political clubs in Paris on the English plan, but they were prohibited by the police. With the meeting of the national assembly, and the outbreak of the revolution, political societies, about 1789, sprang into unwonted activity. These associations mostly assumed the English name—such as the club des Feuillans and the Jacobin club; but they had quite a different character: they were popular societies. In them were concentrated the great political parties of the nation, by means of systematic organization and affiliation. The Jacobin club thus came

in the end to embrace all France, and to rule it. Similar associations sprang up in Germany, Italy, Spain, and wherever the revolution took any root. In Germany, these unions were prohibited in 1793 by a law of the empire; and the prohibition of all political unions and meetings was renewed in 1832 by an act of the Germanic confederation. The suppression of the clubs in France followed the extinction of the revolution, and their place has since been taken by secret societies. After the revolution of 1848, clubs revived in great force in Italy and Germany, after the style of the first French revolution, but speedily came to an end along with that which had given them birth.

CLUBBING, in cabbages, turnips, and other plants of the genus *brassica*, a diseased growth of tubercular excrescences in the upper part of the root or lower part of the stem, caused by the larvæ of the cabbage fly (q.v.), and of other insects, by which the vigorous growth of the plant is prevented, and crops are often much injured. It is common for gardeners to cut away these excrescences, with their contained larvæ, in planting out young cabbages, etc.; and where they are not so numerous that the injury done by the knife is necessarily great, this plan succeeds very well. Dressings of quicklime, wood-ashes, etc., have been recommended, and appear to have proved partially successful in preventing this evil, probably by deterring the parent insect from approaching to lay her eggs; but change of crop, when practicable, is of all things the most commendable. C. is sometimes confounded with anbury (q.v.), from which it is quite distinct.

CLUB-FOOT (Lat. *talipes*) is a distortion or twisting of the foot by one or more of its muscles being permanently shortened. It may exist from birth, or occur in early childhood after convulsive fits. Surgeons recognize four varieties of C.: turning inwards (*varus*), outwards (*valgus*), downwards with elevation of the heel (*equinus*), or upwards with depression of the heel (*calcaneus*).

As age advances, the bones alter in form from the pressure exerted upon them, the ligaments shorten, and the foot becomes rigidly molded in its unnatural position. It cripples the person's movements, and in many instances has proved a great affliction. Lord Byron's whole life seems to have been embittered by one of his feet being inverted.

Although Lorenz, in 1784, cut the tendo Achillis to lower the heel in talipes equinus, yet, owing chiefly to the dangers of cutting across tendons, club-foot was practically incurable till 1731, when Dr. Little, of London, having himself a club-foot, after seeking relief from many surgeons at home and abroad, found his way to Dr. Stromeyer, at Erlangen. This ingenious surgeon introduced a narrow-bladed knife, and divided the tendons of the contracted muscles with such a small external wound that scarcely any inflammation resulted. Dr. Little being cured, published a treatise on the subject, and at the present day no deformity of the foot is considered irremediable. However, it must be remembered that the division of tendons must be followed by judicious manipulations, and generally by the application of some suitable apparatus to prevent the foot returning to its former position. Of such apparatus, Scarpa's shoe, as it is termed, may be mentioned as the one most frequently in use.

CLUB-MOSS. See LYCOPODIACEÆ.

CLUB-RUSH. See SCIRPUS.

CLUNCH, a name given locally by miners to any tough indurated clay, such as is sometimes found in the coal-measures, or in the newer strata. The term has also been applied to the lower and harder beds of the cretaceous rocks, which are sometimes used for the stone-work of the interior of ecclesiastical buildings.

CLUNIACS, or CONGREGATION OF CLUNY, an order founded at Cluny, in France, in 909, by the Benedictines. It spread rapidly, and at one time had more than 2,000 convents. It was suppressed in 1790 by the constituent assembly. Among its great men were Gregory VII., Urban II., and Pascal II.

CLUNY, or CLUGNY, a t. in France, in the department of Saone-et-Loire, 12 m. n.w. of Macon; pop. 4,000. There is considerable agricultural trade, and manufactures of pottery, paper, etc. Its importance lies chiefly in its ancient architecture, including, besides the celebrated abbey, the church of Notre Dame, dating from the 13th c., the church of St. Marcel, with a beautiful spire; the ruins of St. Mayeul; portions of the ancient fortifications; and picturesque houses dating from the 12th c. and onward, all classed among the historical monuments of France. Before the erection of St. Peter's at Rome, the abbey church at Cluny was the largest building of its kind in Europe, being 650 ft. long by 130 wide. During the wars of the 16th c., the buildings were much damaged, and in the revolution (1789) a considerable number were demolished. Large restorations have been made; and now the abbot's palace contains a museum and a library, the cloisters are occupied by a school, and the site of the abbey church affords room for a government stud. The college of Cluny, founded in 1269, has disappeared.

CLUPEIDÆ, an important family of malacopterous (q.v.) fishes, nearly allied to the *salmonidæ*, and differing from them chiefly in the want of an adipose fin. They are all scaly fishes, but the scales are very easily detached. None of the fins have any spinous rays. The ventral fins are nearly in the middle of the body. The dorsal fin is always solitary. The gill-openings are very large. The teeth are small, and generally numerous.

The maxillary bones are composed of three pieces, easily separated. The body is generally elongated, and much compressed; the belly thin, and almost reduced to a sharp edge, frequently denticulated by the edges or points of a series of small bones attached to the skin. The air-bladder is always large; the roe consists of a vast number of eggs. The fishes of this family are almost exclusively marine, only a few of them ascending rivers. They generally congregate in shoals, and some of them periodically visit certain coasts in vast multitudes. They are very widely diffused over the world; some of the particular species have a wide geographic range. To this family belong the herring, pilchard, sprat (garvie, kilkie), anchovy, sardine, white-bait, etc. See these articles. The herring may be regarded as the type of the order, and of the genus *clupea*. But the genera most important in an economical point of view have been very differently distinguished by different ichthyologists.

CLUPESO'CIDÆ, a family of malacopterous fishes, so named from being regarded as exhibiting characters intermediate between those of the *clupeidæ* (herring, etc.) and of the *esocidæ* (pike, etc.). Some of them are marine, and some are fresh water fishes. They are mostly tropical; none are British, To this family belongs the interesting genus *arapaima* (q.v.), and the genera *heterotis* and *butirinus*, containing fishes of very curious structure and appearance, highly prized for the table.

CLUSERET, GUSTAVE PAUL, b. Paris, 1823; educated in the military school of St. Cyr; in 1848, made a maj. of the *garde mobile*, participating in the suppression of the insurrection in June of that year. He served in the Crimea, where he was wounded; and against the Kabyles in 1856; resigning his commission in 1858. In 1860, he joined Garibaldi's staff, and commanded the French legion. In 1862, he came to the United States, took service on gen. McClellan's staff, and afterwards served with Fremont. He became brig.gen. of volunteers in 1862, and two years afterwards resigned and became editor of a weekly paper in New York, advocating Fremont, and opposing Lincoln for a second term. He returned to France in 1867, but was expelled for certain publications concerning a great railway project in the United States in which some officers of the French government were interested. In the war with Germany, he opposed Louis Napoleon's government, and engaged in some unimportant insurrectionary attempts in Lyons and Marseilles. Under the commune he was made minister of war, but was suspected of treachery, and for a time imprisoned. He escaped to Switzerland on the downfall of the commune, and in 1872 was formally sentenced to death.

CLU'SIA (named in honor of the great botanist L'Ecluse or Clusius), a genus of tropical trees and shrubs of the natural order *guttiferæ* (q.v.) or *clusiaceæ*, some of which are commonly called balsam trees, from their resinous or balsamic products. They are very often *epiphytes*, growing on larger trees, over the bark of which their roots spread in search of chinks or decayed parts where they may obtain nourishment; and if it cannot be obtained in sufficient quantity, a root is sometimes sent straight down to the ground, and in due time becomes a kind of stem. The fruit is very curious, a sub-globular capsule, with a number of cells, opening as by meridian lines from top to base. *C. rosea*, a native of the West Indies and tropical parts of America, yields an abundant resin, which is used as an external application in veterinary medicine, and for covering boats instead of pitch. A great quantity of resin exudes from the disk of the flowers of *C. insignis*, the WAX-FLOWER of Demerara, which is used to make a gently stimulating and soothing plaster. This is one of the productions of Demerara, to which the colonists, in preparation for the "Great Exhibition" (of 1862), sought to draw general attention.

CLUSIUM. See CHIUSI, *ante*.

CLUSO'NÉ, a t. of Lombardy, northern Italy, situated near the left bank of the Seiro, 17 m. n.e. of Bergamo. It has manufactures of linen, a trade in corn and iron, and in the neighborhood are vitriol works and copper foundries. Pop. 3,000.

CLUSTERED COLUMNS, or, as they are sometimes called, compound piers, form one of the richest features in Gothic ecclesiastical architecture. The columns or shafts are sometimes attached to each other throughout their whole length, sometimes only at the base and capital. When surrounded by floriated fillets, they have been very aptly compared by sir Walter Scott to "bundles of lances that garlands have bound."

CLUVER, PHILIP, 1580–1623; a German, who traveled in Poland and other countries; first studied law, but forsook it for geography with Joseph Scaliger at Leyden for his teacher. He served two years in the army, visited England, where he married; passed some time in Scotland and France, and returned to Holland, where he published a number of works on geography, all relating to antiquity, except *Introductio in Universam Geographiam.*

CLWYD, a river of North Wales, rises in the Bronbanog hills, in the s.w. of Denbighshire, and runs 30 m., first s., then e.n.e., and lastly n., through Denbigh and Flint shires, past Ruthin, St. Asaph, and Rhuddlan, into the Irish sea. Below Ruthin, and between barren hills, lies the fertile, populous, and level vale of the C., 15 by 5 to 7 miles. At St. Asaph, the C. receives the Elwy, 20 m. long, from the west, and increases much in size. It then enters the fertile and extensive marsh of Rhuddlan, and falls into

the sea by a small estuary. It is navigable for vessels of 70 tons up to Rhuddlan, a distance of 2 m. from its mouth.

CLYDE, a river in the s. of Scotland, the only great British river, besides the Severn, flowing west. Commercially it is the most important river in Scotland, and the romantic beauty of its scenery is widely celebrated. It rises by several large streams in the semicircular range of the Lead, Lowther, and Moffat hills and drains the shires of Lanark, Renfrew, and Dumbarton. The main and southmost source, the Daer, runs n., and receives the Powtrail, the Clyde (a smaller stream, after junction with which, the main stream is called the C.), and other streams, preserving its mountain character to Roberton, upwards of 20 m. below the source of the Daer. The C. then bends round Tinto hill towards Biggar,* from whence it flows n.w., w., and s.w., to about 4 m. above Lanark, thence pursuing a n.w. course through Lanarkshire, and between Dumbarton and Renfrew shires, past Lanark, Hamilton, Glasgow, Renfrew, and Dumbarton, near which town it opens into the firth of Clyde. In this course it receives a number of streams, and flows through a rich, fertile, wooded valley, often extending into level plains, and often with bold wooded banks. From 2 m. above to 4 m. below Lanark occur the celebrated falls of the C., a series of cascades and rapids, the largest in Scotland for quantity of water—the total descent, in the course of 6 m., being 230 ft., over old red sandstone rocks, amid very picturesque scenery. Two of the falls are above, and two below Lanark. Bonniton linn, 2 m. above Lanark, is a cascade of 30 ft., with some parts only 4 ft. broad. Corra linn, half a mile below the last, is the grandest fall, forming three distinct leaps—in all, 84 ft. high. Dundaf fall is ten ft. high. Stonebyres linn, 2 m. below Corra linn, forms three distinct falls—in all 70 feet. Below Glasgow, the C. expands into an estuary, navigable by the largest vessels, and at Greenock it attains a breadth of about 4 miles. Opposite this point it communicates with the Gareloch, and a little below, with Loch Long on the north. Its course, which from Glasgow has been w.n.w., now turns suddenly s., in which direction, inclining a little to the w., it continues to flow between Argyle and Bute, and Cantire on the w., and Renfrew and Ayr shires on the e., until it becomes identified with the North channel at Ailsa Craig, where its breadth is about 30 miles. The C. from its source to Glasgow is, by its windings, 75 m. long, and from Glasgow to the south end of Cantire, 48 miles. Its basin occupies 1500 sq.m., and consists of carboniferous strata and trap rocks, the latter chiefly forming the bordering mountains. Floods sometimes raise its waters 20 ft., and it has changed its course at Renfrew, which was once close to it. Clydesdale, or the valley of the C., is noted for its coal and iron mines, orchards, and horses. Bell, in 1812, launched on the C. the first boat in Europe successfully propelled by steam.

CLYDE, a village in the t. of Galen, Wayne co., N. Y., on Clyde river, the Erie canal, and the N. Y. Central railroad, 38 m. w. of Syracuse; pop. about 2,500. It is a place of active trade, and has a considerable manufacturing industry.

CLYDE, LORD. See CAMPBELL, Sir COLIN.

CLYMER, GEORGE, 1739–1813; b. Philadelphia; one of the signers of the American declaration of independence. He was a member of the council of safety, and with four others was appointed to take the place of the Pennsylvania delegation in the continental congress which had refused to sign the declaration of independence. He filled various important positions, both military and civil, until the peace of 1783. Afterwards he was sent to the legislature, and in 1787, was a member of the convention that framed the U. S. constitution. He was also a member of the first federal congress, and held many honorable offices in Philadelphia.

CLYS'TER (Gr., from *klyzo*, I wash out), called also *enema*, a medicine administered in the liquid form by the rectum, or lower end of the intestine. It is used either for the purpose of procuring evacuation of the bowels, or of conveying stimulating or nourishing substances into the system. For the latter purpose, wine and beef-tea, or milk, in quantities of a few ounces at a time, are employed; for the former, simple warm or cold water in sufficiently large quantity to distend the bowels, and produce evacuation; or in special cases, various cathartics may be used in addition, such as colocynth, aloes, castor oil, or turpentine made into an emulsion with yelk of egg, and sometimes carminatives, to expel air. Narcotic clysters are also employed, but should only be used under medical superintendence. An injecting syringe, with a flexible tube, and a double-action valve, is usually employed for the administration of this remedy.

CLYTEMNES'TRA, in Homeric legend, the daughter of king Tyndareus and of Leda, and the twin-sister of Helena, became the wife of Agamemnon, and bore him a son, Orestes, and two daughters, Iphigenia and Electra. During the absence of Agamemnon on his expedition to Troy, she formed a connection with Ægisthus, murdered her husband on his return, and reigned for seven years with Ægisthus, till she was murdered by her own son, Orestes.

CLYTIE, a water nymph in love with Apollo. Meeting with no return for her affection, she was changed to a sunflower. In that form she gazed upon Apollo (the sun),

* In very high floods, the waters of the Clyde sometimes overflow in the boggy ground there, and a portion runs into the Biggar Water, and so into the Tweed.

and hence the notion that this flower turns on its stalk as the sun moves along the sky, always presenting its full face to that luminary.

CNEPH, the name under which the Egyptians adore the creator of the world.

CNI'DUS, or GNIDOS, a city on the promontory of Triopion (now cape Krio), in Caria, in Asia Minor, a Lacedæmonian colony, and one of the six cities of the Doric league. C. (according to Strabo) had two ports, one of which could be closed. In front of what was the town, lies a lofty island, about 600 yards long, which was connected with the mainland by a causeway (now a sandy isthmus). The southern port was formed by two moles, carried into the sea to the depth of nearly 100 ft., one of which is nearly perfect at the present day. The city was famous for several temples of Venus, who was therefore sometimes called the Cnidian goddess. One of these temples contained the famous statue of the naked Venus by Praxiteles. It was of Parian marble, and so beautiful, that Nicomedes, king of Bithynia, offered, in return for this masterpiece of Grecian sculpture, to pay the entire debt of the city, which was very large. The Cnidians, in the excess of their devotion to art, refused. During the wars in ancient times, C. was often mercilessly plundered. The site of the city is "covered with ruins."

CNOSSUS, or GNOSSUS, a city of Crete on the n. side of the island, 3 m. from the coast, said to have been founded by Minos, a traditional king of the island. Tradition says that Jupiter was born, married, and buried near Cnossus; and it is also said to have been the site of the labyrinth in which the Minotaur was confined. This fable may have arisen from the many intricate caverns in the region. The inhabitants were Dorians, with Dorian manners, customs, and political institutions. With the other parts of the islands it finally became a Roman colony. Among its great men were Ænesidimus, the skeptic philosopher, and Chersiphron, the architect of the temple of Diana at Ephesus.

COACH is a general name for a vehicle drawn by horses, designed for the conveyance of passengers, as distinguished from a wagon or cart, for the conveyance of goods. Coaches or inclosed carriages, drawn on wheels, and intended for passengers, were inventions which have been claimed by Hungary, England, Italy, France, Spain, and Germany. The name is derived by Wedgwood from Fr. *coucher*, to lie, which becomes in Dutch *koetsen*, whence *koetse* or *koets-wagen*, a litter or carriage in which you may recline. The earliest record found by Beckmann relates to about the year 1280, when Charles of Anjou entered Naples, and his queen rode in a *caretta*—apparently a small but highly decorated car, from which the modern *charet* or *chariot* was derived, as well as other vehicles named *chares* and *chariettes*. It is believed that most of these vehicles had broad wheels, the only form suited for the wretched roads of those ages; and it is certain that all those of early date were open overhead. Many of the coaches used by the continental princes and nobles in the 16th c. were closed only to this extent—that they had canopies supported by ornamental pillars, and curtains of cloth, silk, or leather, which could be drawn easily aside. A *glass* C., or C. with glass windows, is specially mentioned as being used by an infanta of Spain in 1631. The traces of the coaches were at first made of rope; those only belonging to the highest personages were made of leather. It is believed to have been in the time of Louis XIV. that coaches were first suspended by leathern straps, in order to insure ease of motion.

The first C. ever seen in England is said to have been one made in 1555 by Walter Rippon for the earl of Rutland; and in 1564, the same builder made a showy vehicle for queen Elizabeth. Later in the reign, the royal carriages had sliding panels, so that the queen could show herself to her loving subjects whenever she desired. During the closing years of Elizabeth's reign, and early in the 17th c., the use of pleasure-carriages extended rapidly in England. The coaches had first to struggle against the opposition of the boatmen on the rivers, and then against that of the sedan owners and bearers; but they gradually came into very general use. The successive steps whereby the coaches of those days gave way to the elegant vehicles of the present, need not be traced in detail, even if there were the means to do so.

The following are some of the chief kinds of pleasure-carriages: The *dennet* is a two-wheeled vehicle for one horse, with a jointed hood or head covered with leather, and a driving-box. The *stanhope* bears some resemblance to the dennet. The *tilbury* is in like manner a two-wheeled vehicle for one horse; but it has pliable leathern braces between the springs and the body of the vehicle, together with suspension brackets. The *cabriolet* belongs to the same class as the tilbury. The name *cab* is an abbreviation of cabriolet, but it has come to be applied to a four-wheeled vehicle. The *curricle* is a two-wheeled vehicle for two horses; there are no shafts, but a pole, fixed to a frame which supports the body, passes between the horses, and is suspended from a metal bar resting on their backs. The *phaeton* is a four-wheeled vehicle which may be drawn either by one or two horses; its front body is something like that of a dennet or stanhope, and behind this is an open seat, supported on a kind of large box. The *coach* is a closed four-wheeled vehicle for two or more horses, with two seats inside, and a skillfully constructed arrangement of springs to insure ease of motion. The *chariot*, or chaise of modern days, usually differs from the C. in having only one seat. The *landau* is a C. made to open occasionally. The *barouche* is permanently open, with only a leathern hood or head over it. The *britzschka* is a kind of small barouche. In addition to these, our age has witnessed the manufacture of the *brougham*, a miniature coach

usually for two persons, but in which four may be accommodated; and the *clarence*, a pair-horse carriage with movable glazed panels and hood, and for two or more persons.

The manufacture of carriages, whether pleasure-vehicles or omnibuses, ranks in the highest class of mechanical labor. There is a necessity for the best materials and the best workmanship: since, owing to the severe strains and jerks to which the vehicles are subject, cheap construction is in the end unprofitable. Many different kinds of wood are employed in the construction. The body of the C. is made by one set of workmen, the under-framing by another; the former partaking more than the latter of the nature of cabinet-work. The steel-spring making is delicate work, owing to the necessity for combining strength with lightness and elasticity; and the various pieces of iron-work require careful adjustment, especially the axles. The covering of the upper part of the body of a C. with leather is one of the most difficult parts of the manufacture; one single hide is employed, the leather being worked round the corners by repeated currying while wet; and all must be rendered smooth, without even a puncture. The best coaches receive as many as 20 to 30 coats of oil-paint; and the polishing processes are numerous and carefully conducted. The carving, gilding, herald-painting, lace and fringe work, metal ornamentation, etc.—all are among the best examples of their respective handicrafts.

English carriages are considered to be the best in the world; none else combine so much strength with an equal degree of beauty. The artisans employed in this trade, especially coach-body makers and coach-spring makers, command a very high rate of wages.

COACH-DOG, or DALMATIAN DOG, a variety of dog apparently allied to the hounds, although it is said to be deficient both in keenness of scent and in sagacity. It is often kept in stables, becomes attached to the horses, and may be seen running after carriages. Its general light color and numerous dark brown or black spots are constant characteristics; as are also its short hair, tail destitute of brush, and inoffensive disposition. Its origin is uncertain; the name Dalmatian is probably altogether misleading; and it is supposed that it may have been brought from India, where a very similar kind of dog exists.

COACH-WHIP SNAKE, a serpent of the United States, having a long narrow head, small neck, long body, and a tail like the lash of a whip. It is sometimes more than two yards long. It is not venomous, but will defend itself with great courage by twining its long folds around an enemy. It lives on birds and small animals. Found only in the states of South Carolina, Georgia, and Florida.

COADJU'TOR (Lat.), a fellow-worker not as principal but as second, an assistant. Technically, it is applied in ecclesiastical law to one appointed to assist a bishop, whom age or infirmity has disabled. By 52 Geo. III. c. 62, coadjutors to bishops and archbishops in Ireland are empowered to exercise all the powers of their principals except that of presenting to benefices. See EXECUTOR.

COAGULATION, the amorphous (q.v.) solidification of a liquid, or part of a liquid, as when the caseine of milk is solidified by rennet in making cheese (q.v.), or the white of an egg by boiling. The process varies in various substances. Albumen, or the white of an egg, coagulates at a temperature of 160°. Milk is coagulated or curdled by the action of rennet or by acids. The fibrin in the blood, chyle, and lymph of animals is coagulated by the separation of these fluids from the living body. See BLOOD.

COAHO'MA, a co. in n.w. Mississippi, on the Mississippi river; 750 sq.m.; pop. '80, 13,563—11,154 colored. It is low and level, and much of the land is frequently inundated; but the soil is good, producing chiefly corn and cotton. Co. seat, Friar's point.

CÖAHUI'LA, a state of the Mexican confederation, is separated from Texas, in the United States, by the Rio Bravo del Norte, in lat. 24° to 30° n., and long. 100° to 103° east. It contains 50,000 sq.m., and (1873) 98,397 inhabitants. The capital is Saltillo, with a pop. of 8,105; there are besides the towns of Coahuila and Santa Rosa. It possesses ses some silver mines; but it is valuable chiefly for its pasturage.

CÖAT'TA. See ATELES.

COAL, in the sense of a piece of glowing fuel (and hence a piece of fuel, whether dead or alive), is a word common to all the languages of the Gothic stock (Icel. *kol*, Ger. *kohle*), and seems allied to the Lat. *caleo*, to be hot; as also to *glow*, and *kiln*. The different sorts of fuel are distinguished by prefixes, as *char*coal, *pit*-coal, *sea*-coal; but in England, owing to the absorbing importance of mineral or pit-coal, the word C. alone has come to be used in this special signification (Ger. *steinkohlen*, Fr. *charbon de terre*).

C. is one of the most important of all minerals; it consists chiefly of carbon, and is universally regarded as of vegetable origin. Its geological relations are noticed in the article CARBONIFEROUS SYSTEM. It generally occurs in strata or beds; it is always of a black or blackish-brown color; some of the varieties have a very considerable degree of vitreous or resinous luster, and some are very destitute of luster; some have a shell-like fracture, and some have a sort of slaty structure, and are readily broken into cubical or rhomboidal fragments. The precise characters of C. as

a mineral species are not easily defined, and both in Britain and other countries important cases have occupied courts of law, in which this difficulty was strongly felt, as in the great Scottish lawsuit concerning the *Torbanehill Mineral* (q.v.). C., indeed, is rather a commercial than a scientific term, but in a general way we may define it as a fossil fuel of black color and stony consistency, which, when heated in close vessels, is converted into coke with the escape of volatile liquids and gases. The variety known as blind C. or anthracite no doubt gives off scarcely any volatile matter, but this is because it has undergone a natural distillation through metamorphism or other cause. We may therefore divide C. into two primary divisions, namely, (1) *Anthracite*, which does not, and (2) *Bituminous C.*, which does flame when kindled. Anthracite (q.v.) sometimes contains as much as 94, and if we exclude the ash, 98 per cent of carbon, and as this element decreases in amount it graduates into a bituminous coal. The term anthracite is, however, still applied to some coals which do not contain more than 80 per cent of carbon. Various synonyms, such as stone C., glance C., culm, and Welsh C., are also used to designate this substance, which is used chiefly for smelting purposes and for raising steam. It is difficult to kindle, but gives out a high heat in burning. Bituminous C. includes an almost endless number of varieties, one of the best marked being *cannel* or *parrot C.* Cannel C. is so called from burning with a bright flame like a candle, and the name parrot C. is given to it in Scotland from the crackling or chattering noise it makes when burned. That of different localities varies much in appearance, but it is most commonly dull and earthy, or with only a slight luster; some examples are, however, bright and shining. In texture it is nearly always compact, and certain beds of it admit of being polished in slabs of considerable size, which approach black marble in appearance. Of this material vases, inkstands, boxes, etc., are made. Cannel C., from the large percentage of ash which it contains, is not suitable for house fires, and is for the most part consumed in making gas, of which it yields from 8,000 to 15,000 cubic ft. per ton. When distilled at a low red-heat it yields paraffin oil. The other varieties of bituminous C. are so numerous that, as an admiralty report states, there are as many as 70 denominations of it imported into London alone. Still, among these there are three leading kinds—1. *Caking C.*, which cakes or fuses into one mass in the fire. It breaks into small uneven fragments, and is found largely at Newcastle and some other localities. 2. *Splint or hard C.*, occurring plentifully in Scotland, which is hard, and has a kind of slaty fracture. It is not very easily kindled, but when lighted makes a clear lasting fire. 3. *Cherry or soft C.*, which breaks easily into small irregular cubes, has a beautiful shining luster, is readily kindled, and gives out a cheerful flame and heat. It is common in Staffordshire. Brown C. or lignite (q.v.), though inferior to true C., is nevertheless an important fuel in some countries in default of a better kind.

The use of C. does not seem to have been known to the ancients; nor is it well known at what time it began to be used for fuel. Some say that it was used by the ancient Britons; and at all events it was to some extent an article of household consumption during the Anglo-Saxon period as early as 852 A.D. There seems to be reason for thinking that England was the first European country in which C. was used to any considerable extent. About the end of the 13th c., it began to be employed in London, but at first only in the arts and manufactures; and the innovation was complained of as injurious to human health. In 1316, the parliament petitioned the king, Edward II., to prohibit the use of C., and a proclamation was accordingly issued against it; but owing to the high price of wood, its use soon became general in London. It was for a long time known there as *sea C.*, because imported by sea.

Several theories as to the mode of the origin of C. have been put forth from time to time. The one now generally believed in is that the rank and luxuriant vegetation which prevailed during the carboniferous age grew and decayed upon land but slightly raised above the sea; that by slow subsidence this thick layer of vegetable matter sunk below the water, and became gradually covered with sand, mud, and other mineral sediment; that then, by some slight upheaval of the sea bottom or other process, a land surface was once more formed, and covered with a dense mass of plants, which in course of time decayed, sank, and became overlaid with silt and sand as before. At length, thick masses of stratified matter would accumulate, producing great pressure, and this, acting along with chemical changes, would gradually mineralize the vegetable layers into coal. Some experiments made by Dr. Lindley, a few years ago, showed that of a large number of plants kept immersed in water for two years, the ferns, lycopodiums, and pines were those which had the greatest powers of resisting decay, and C. appears to be mainly composed of the substance of the ancient representatives of these three orders of plants. The interesting fact has also been lately proved by Huxley, Morris, Carruthers, and others, that in many instances the bituminous matter in C. is almost wholly formed of the spore cases and spores of plants allied to our club-mosses and ferns.

As will be seen from the following table, wood, peat, lignite or brown C., and true C. indicate by their composition the changes which vegetable matter undergoes by decay and pressure; and a table in which a considerable number of examples of each substance could be given would show how gradually these substances pass into each other:

	Wood.	Peat.	Lignite.	Coal.
Carbon	50.0	60.0	65.7	82.6
Hydrogen	6.2	6.5	5.3	5.6
Oxygen	43.8	33.5	29.0	11.8
	100.0	100.0	100.0	100.0

In each of these bodies there is usually a small percentage of nitrogen, which in the above table has not been separated. In passing from wood or peat to C., the proportion of oxygen and hydrogen decreases, these substances being given off in the form of marsh-gas and carbonic acid in the process of decay.

Since the prosperity of our great national industries, as well as much of our domestic comfort, depends on the continuance of an abundant supply of cheap fuel, much anxiety has arisen in Great Britain of late years regarding the future supply and price of coal. Since the fall of 1872, a great rise has taken place in its price. This is partly owing to the unusually high rate of miners' wages which has prevailed, and partly to the fact that some of the richest and most easily worked English coal-seams are becoming exhausted. There is therefore some cause for apprehension, yet, as the following figures taken from the estimate in the report of the royal commission on C., dated 1871, will show, we have still vast supplies of fossil fuel.

Taking into account the coal which probably exists under the permian, new red sandstone, and other superincumbent strata in the United Kingdom, the C. commissioners increase their estimate of the quantity still available for use to 146,480 millions of tons. At the present rate of annual production—namely, 122,500,000 tons, this would last 1186 years. But, as may be supposed, the estimates which have been put forth regarding the probable duration of our coal-fields are very various, some authorities asserting that, owing to increase in population, and the increasing consumption of coal in manufactures, about 100 years will suffice to exhaust them. Between this and the other extreme of about 1000 years, formed on the assumption that hereafter the population of the country will but slightly increase, there are innumerable conjectures and estimates.

AVAILABLE COAL IN THE CHIEF BRITISH COAL-FIELDS AT DEPTHS NOT EXCEEDING 4000 FEET, AND IN SEAMS NOT LESS THAN 1 FOOT THICK.

	Tons.
South Wales	32,456,208,913
Midland (Yorkshire, Derbyshire, and Nottinghamshire)	18,172,071,433
Northumberland and Durham	10,036,660,236
Lancashire and Cheshire	5,546,000,000
Bristol	4,218,970,762
North Staffordshire	3,825,488,105
Lesser English coal-fields	5,952,740,019
Total of Scottish coal-fields	9,843,465,930
Total of Irish coal-fields	155,680,000
Grand total	90,207,285,398

On the continent of Europe, productive coal-fields occur in Belgium, France, various parts of northern Germany, Spain, and Russia. By far the largest in area are those of Russia, and they are known to contain many valuable beds of C., although, as yet, comparatively little has been worked. C. is also found in India, China (where the coal-fields are estimated to cover 400,000 sq.m.), Japan, and the Malayan archipelago, in Australia and New Zealand, and in Africa. Turning to the new world, there is evidence of promising coal-deposits in several South American countries, but, owing to the great supply of wood in their forests, there is little temptation to work them. In Canada, Nova Scotia, New Brunswick, and Newfoundland, there are small though valuable coal-fields; but, in the United States, enormous fields of fossil fuel are found. The entire area of these is about 200,000 sq.m., being 38 times greater than the area of the coal-fields of Great Britain. But although the coal-measures of the states are of vast extent, and contain many valuable coal-seams—a few of them 40 and even 50 ft. thick at certain places—it has been doubted whether the amount of workable C. in them is not greatly exaggerated by American writers. In proportion to the extent of the seams, the quantity of C. annually raised in the states is small, being only about 40,000,000 tons.

Coal-trade.—The production and sale of C., like every other important branch of industry, was long fettered with legislative regulations. At a very early period, the corporation of the city of London undertook the duty of either weighing or measuring the C. brought into the port, and by a series of statutes, commencing with 7 Ed. VI. c. 7, the mayor and aldermen of London, and the justices of the counties, were empowered to fix the price of C. to be sold by retail; and in case of refusal by the parties to sell at the prices fixed, to enter their wharves, or other places of deposit, and to cause it to be sold at the prices which they had set. In addition to the general supervision which they thus possessed, and the sums which they were empowered to exact for their

trouble, the corporations of London and other towns have exacted, and still continue to exact, dues on C. for local purposes. These were first imposed in London, in 1667, after the great fire, in order to enable the corporation to repair the ravages which it had committed; and they have been since continued as a fund for civic improvements, though, as Mr. M'Culloch has remarked, no improvement could be equal to a reduction in the price of coal. In the reign of William III., a general tax, payable to government, was laid on all *sea-borne C.*—a tax which was in the highest degree unjust to places which were dependent for their supply on the coasting-trade, and oppressive to the whole country, inasmuch as it amounted to more than 50 per cent on the price paid to the owner at the pit's mouth. The tax varied in amount, not only at different periods, reaching its highest point of 9*s.* 4*d.* per chaldron during the great war, but also in different parts of the country, being higher in London and the s. of England, and lower in Ireland and Wales, whilst Scotland for a considerable period was altogether exempt. The tax itself, with all its inequalities, was abolished in 1830, and there is now no tax on C. except that collected for local purposes in London, and a few other towns. The repeal, in 1845, of the duty on C. exported to foreign countries, was a measure of much more doubtful policy. The average annual quantity of C. exported from Great Britain during the three years ending 1877, was about 14,000,000 tons.—For the provisions of the recent statutes for the regulation and inspection of mines (23 and 24 Vict. c. 151, and 35 and 36 Vict. c. 76), see MINES. The circumstances in which coal-mines are regarded as a pertinent of land, and those in which they form a separate estate, are stated under MINES.

Coal-note, a particular description of promissory-note, used in the coal-trade in the port of London (3 Geo. II. c. 26, ss. 7, 8). See COAL-SUPPLY.

COAL (*ante*). In North America the carboniferous strata are divided by geologists into two principal groups: the lower or sub-carboniferous, which corresponds to the carboniferous limestone of Europe; and the carboniferous, which includes the millstone grit and the coal-measures. The first of these is about 5,000 ft. thick in Pennsylvania, consisting mainly of shales and sandstones; but in the Mississippi valley, in Illinois, Iowa, and Missouri, a considerable thickness of limestone is developed in this part of the series. In the former region some thin coal-seams are found, the relation between the two areas being in this respect similar to that of the carboniferous limestone in England to the coal-bearing formations of similar age in Scotland. The millstone grit forms a mass of sandstone and conglomerates from 1200 to 1400 ft. thick in e. Pennsylvania, but thins rapidly to the w., being only from 100 to 250 ft. thick in Ohio and Tennessee. In Arkansas the compact silicious rock known as novaculite, or Arkansas hone-stone, occurs in this member of the carboniferous series. The coal-measures proper occur in a very large part of the United States and Canada. First in importance is the Appalachian coal-field, covering about 60,000 sq.m. extending through parts of Pennsylvania, Ohio, Virginia, Kentucky, Tennessee, and Alabama. The maximum thickness of strata is from 2,500 to 3,000 ft.; 120 ft. near Pottsville, 62 ft. at Wilkesbarre, and 25 ft. at Pittsburg, showing a gradual diminution in a westward direction. The most persistent coal deposit is the Pittsburg seam, which is known over an area measuring 225 by 100 m., but with a thickness varying from 2 to 14 feet. The anthracite district of Pennsylvania occupies an area of about 650 sq.m. on the left bank of the Susquehanna. The strata between Pottsville and Wyoming, which belong to the lowest portion of the coal-measures, are probably about 3,000 ft. thick, but it is difficult to come at an exact estimate owing to the numerous folds and contortions. There are from 10 to 12 seams above 3 ft. in thickness; the principal one, known as the Mammoth or Baltimore vein, is 29 ft. thick at Wilkesbarre, and in some places exceeds even 60 feet. The Illinois and Missouri basin covers a considerable part of these states, as well as of Indiana, Kentucky, Iowa, Kansas, and Arkansas. Its area is estimated at 60,000 sq.m., the thickness varying from 600 ft. in Missouri to 3,000 ft. in w. Kentucky. The aggregate thickness of C. is about 70 feet. A good furnace C. is found in Indiana, the so-called block C. near Indianapolis, which, like the splint C. of Scotland and of Staffordshire, can be used in blast furnaces without coking. In Michigan a nearly circular area of coal-measures of about 5,000 sq.m. occurs in the lower peninsula between lakes Erie and Huron. The thickness is only 120 ft., and the C. is unimportant. There are also coal-bearing areas of less value in Texas and Rhode Island.

The carboniferous strata are largely developed in the e. provinces of the dominion of Canada, notably in New Brunswick and Nova Scotia. The lower carboniferous group here consists of about 6,000 ft. of red sandstones and green marls with thick beds of fossiliferous limestone, accompanied by gypsum. The overlying coal-measures, including the millstone grit, occupy an area estimated at 18,000 sq. miles. The whole thickness of this group in one place is about 14,750 ft., with 76 included coal-seams, together 45 ft. in thickness, which are contained in the middle division of the series. At Pictou there are six seams, together measuring 80 ft. in thickness. The coal-measures in this area approach nearer to the great coal-fields of Europe in thickness than those of the other American carboniferous districts. Rocks of the carboniferous age occur in various places on both flanks of the Rocky mountains, and in the Arctic archipelago, but they have not been explored. Lignite-bearing strata of cretaceous and tertiary age occupy a considerable area in the central and western portions of North America, especially in the

upper Missouri and Saskatchewan valleys, in Utah, Texas, California, Oregon, and Vancouver island. In the last locality for several years past, C. has been extensively mined near Nanaimo, on the e. coast, in strata of the cretaceous age. Tertiary lignites are worked in Bellingham bay, at Coosa bay in Oregon, and at monte Diablo near San Francisco. The lignite formations of the e. flank of the Rocky mountains, which are considered by Hayden to occupy a position between the cretaceous and the eocene tertiary strata, cover an area estimated at about 50,000 sq.m. within the United States, and extend n. into Canada and s. into Mexico.

In South America, coal, probably of the carboniferous age, is found in the Brazilian province of São Pedro, Rio Grande do Sul, Santa Catharina, and in the neighboring state of Uruguay. The largest area is that known as the Candiota coal-field, which is exposed for about 50 m. in the valley of the river of the same name. The sections exposed show five seams from 9 to 25 ft. each, or in all about 65 ft. of coal. Other basins are known at San Sepé, and San Jeronima, on the Jacahahay river. The latter is the only point at which mines are worked, as the C., though thinner than that of other localities mentioned, is situated within the reach of navigable waters, needing a land carriage of only 8 m. to the river.

On the w. coast of South America cretaceous coal is worked at Lota in Chili, and at Sandy Point in the straits of Magellan. In Peru both secondary and carboniferous coal is known at various points in the interior, the former occupying a position on the first rise of the Andes, while the latter occurs in higher ground, and at a greater distance from the coast. Good coal is also found at many points in the Santa valley. Much of the Peruvian coal has undergone considerable disturbance and metamorphism subsequent to its deposition. At Porton, 45 m. e. of Truxillo, a ridge of coal-bearing sandstones has been changed into a hard quartzite, with an interstratified seam of anthracite in a nearly vertical position. The coal is remarkable as containing a large amount of sulphur.

The annual production of coal throughout the world was roughly estimated for 1874 at 260,000,000 tons, including about 17,000,000 tons of lignite and C. from formations newer than the coal-measures of Europe. Nearly one half of the total was raised in Great Britain. Excluding lignite the figures are as follows:

	Tons.		Tons.
Great Britain.....	125,000,000	Russia.....	1,000,000
United States.....	48,000,000	Spain.....	750,000
Germany.....	35,000,000	India.....	700,000
France.....	17,500,000	Other Europe.....	125,000
Belgium.....	17,000,000	British N. America.....	750,000
Austria.....	4,700,000	Chili.....	200,000
New S. Wales.....	1,300,000	Australia.....	50,000

In America the first C. discovered was by father Hennepin, near what is now Ottawa, Ill. The first mining of C. was in 1813, when five boat-loads of flinty C. were floated down the Lehigh river and sold in Philadelphia for $21 per ton. The fuel of the period was almost entirely of wood, Liverpool C. being a rare luxury. As late as 1821 only 22,122 tons of C. (Liverpool) were imported into the United States. The first regular shipments of C. from the Pennsylvania mines began in 1820. The C. industry of Pennsylvania has reached enormous proportions, the annual product being valued at over $50,000,000. Besides more than 20,000,000 tons of anthracite C. there are mined in Pennsylvania near 10,000,000 tons of bituminous C. per annum. Of bituminous C. the states of Ohio and Illinois produce the next most extensive yield, each about 3,000,000 tons annually. In 1870, there were 1566 collieries in the United States, employing 92,454 hands, and invested capital to the amount of $110,000,000. In 1820, the total C. product of Pennsylvania was less than 2,000 tons. It is now more than 30,000,000 tons per annum. See ANTHRACITE.

COAL-BEDS. See CARBONIFEROUS SYSTEM.

COALBROOK DALE, an English coal-field in the valley of the Severn, which supplies considerable quantities of coal and iron. The group of strata which includes the coal-beds is from 700 to 800 ft. thick.

COAL-FISH, *Merlangus carbonarius* a fish of the same family with the cod and haddock (*gadidæ*), and of the same genus with the whiting. It is not unlike the whiting in form, and in its fins, which, however, are not proportionally so large; but is of a very different color, the upper parts being nearly black. It attains, also, a much larger size, being often 2 or 3 ft. in length. It is celebrated among fishermen for its voracity; and is commonly found in large shoals, which, when attracted by bait, will keep near a boat till great numbers are taken. It is rather a coarse fish, but is much used in the northern parts of the world, both fresh and salted, or dried. It is found in the most arctic regions, even on the shores of Spitzbergen, and both on the European and American sides of the Atlantic. It is very plentiful on the British coasts, and in Scotland is generally known as the *sethe*. The fry are taken in great numbers by juvenile fishers stationed on rocks, and are called *podleys* on the e. and w. coasts of Scotland, *sillocks* and *cuddies*

on some of the Scottish coasts, and *coalseys* in the n.e. of England. This fish forms an important part of the food of the Orkney and Shetland islanders, and of the inhabitants of some of the Hebrides. Vast numbers of the fry are sometimes caught by means of blankets in the mouths of streams in the Hebrides. The liver of the coal-fish abounds in oil, which is used for lamps.

COALITION, in politics, is applied to the union of two parties, or, as it generally happens, portions of parties, not of the same opinion, who yet agree to sink their differences, and act in common. Pitt the elder, when he took office in 1757, coalesced with the whig aristocracy represented by the duke of Newcastle. The ministry always spoken of, however, as the great C. was formed in 1782, when Fox, the leader of the reformers, took office along with lord North, the leader of the opposite party. When lord Derby's ministry resigned in 1853, there was a short C. between the Whig party, under lord John Russell, and the more moderate of the conservative party, under lord Aberdeen.

COAL-SUPPLY. Referring to CARBONIFEROUS SYSTEM and COAL for various details connected with the localities of coal-beds, the diversity of qualities, and the modes of working, we shall treat here of a question which has recently been accepted as one of great importance to the welfare of the nation—viz.: the amount of available supply. All the coal now existing was formed untold ages ago, when the conditions of temperature and moisture on the earth's surface were different from those now prevailing. Coal is not a growth annually renewable, but an accumulation which we are gradually spending. We are living, not on the interest of our coal, but on the capital. This is a truth which scientific men have recognized for some time past; but statesmen and manufacturers, mine-owners and merchants, have paid singularly little attention to the subject, under the supposition that the existing stock will last for so great a period as to relieve us from all anxiety on the matter. John Williams in 1789, sir John Sinclair in the *Statistical Account of Scotland*, Robert Bold in 1812, and Dr. Buckland in 1830, were almost the only writers, until recently, who cautioned England that her supply of coal will not last forever. Two volumes on the *Coal Question*, however, by Mr. Hull and Mr. Jevons respectively, effectually roused public attention to the matter.

At the Newcastle meeting of the British association in 1864, sir W. G. Armstrong, as chairman, forcibly urged the subject on the attention of scientific and practical men. He said: "Contemplating the rate at which we are expending those seams of coal which yield the best qualities of fuel, and can be worked at the least expense, we shall find much cause for anxiety. . . . We have already drawn from our choicest mines a far larger quantity of coal than has been raised in all other parts of the world put together; and the time is not remote when we shall have to encounter the disadvantages of increased cost of working, and diminished value of produce." He urged especially that we ought not to squander our coal as at present. We waste nearly all the smoke, heated air, and heated gases from our furnaces; we waste sadly in our open fire-places; and there is a vast quantity of small-coal recklessly burned at the pit's mouth. Various statistics as to supply and consumption had furnished sir W. G. Armstrong with his data. So widely have estimates differed as to available quantity still in store, that between 1792 and recent times, the conjectures, for Northumberland and Durham alone, varied from 200 years to 1700 years, as the period during which the whole nation could be supplied from this one coal-field; but more earnest attempts have been made in late years to arrive at approximate figures. In 1857, M. De Carral, a Prussian mining-engineer, estimated the coal-mining of that year in all countries at 125 million tons, with an average value of 7*s.* per ton at the pit's mouth; he credited Prussia with enough unexhausted coal to supply all the world for 900 years. In 1861, Mr. Robert Hunt ascertained, by reliable mineral statistics, that Great Britain raised 86 million tons in the year; that the quantity was increasing by nearly 3 million tons every year; and that we were working our mines at thrice the rate which had been in force 20 years before. These facts had much influence in drawing the attention of public men to the subject. The produce of Great Britain in 1861 was from 3,052 collieries; and the different districts joined in the supply as follows: Durham and Northumberland, 19 million tons; Lancashire, 12; Yorkshire, 9; Staffordshire and Worcestershire, 7; South Wales, 7; Derbyshire and Nottinghamshire, 5; Scotland, 11; all other districts, 16—amounting to a total of 86 million tons. M. Burat, in his *Situation de l'Industrie Houillère en* 1864, estimated the coal-produce of the world at 141 million tons, of which he credited Great Britain with about four-sevenths. In the same year, sir W. G. Armstrong, taking Mr. Hull and Mr. Hunt as his authorities, estimated the available stock of coal in the United Kingdom at 80,000 million tons, rejecting all seams below 4,000 ft. as too deep to work, and all less than 2 ft. thick as too thin to work. Taking 1864 as a standard of consumption, it would last 930 years; but at the rate of increase of recent years, it would only last 212 years, because this rate would be geometrical and not merely arithmetical in its progression.

In the year 1866, the question came into the arena of the British parliament. On April 17, during a discussion in the house of commons on the malt-tax, Mr. J. Stuart Mill dwelt on the fact that coal is one of our greatest sources of national wealth; and he accepted as trustworthy the calculations of Mr. Jevons—that in three or four generations we shall have scarcely any usable coal at a less depth than 4,000 ft., a depth which

will either be unworkable, or workable only at a greatly increased cost. This speech made a great impression on the house; and the government, a few days afterwards, undertook to ascertain what facts the officers of the geological survey possessed on the subject. On May 3, the chancellor of the exchequer, Mr. Gladstone, made his financial statement for the year, in which he accepted Mr. Mill's views, based as they were on the opinions of sir Roderick Murchison, sir John Herschel, sir W. G. Armstrong, Dr. Percy, Mr. Hull, Mr. Jevons, and other authorities. He assented to the probability that by the year 1970, if matters go on at their present rate, we shall have no coal left. "I disbelieve and disapprove," he added, "of all attempts to limit by law the consumption of coal. In vain would it be to think of stopping the consumption of coal in this country; in vain would it be to think of diminishing that consumption by the imposition of a tax; and it would be more vain still to think of prohibiting its exportation." In other words, the remedy, if any, can *not* be by legislation. The question was brought to a decisive point on June 12, when Mr. Hussey Vivian moved an address to the crown, praying for the appointment of a royal commission to investigate the whole matter. In an elaborate speech, he stated his reasons for believing that the forebodings of Mr. Hull and Mr. Jevons are too gloomy—that advancing science will enable miners to contend against the temperature and pressure of deeper mines than have hitherto been thought practicable; that we shall be better able than ever to ventilate and drain the deep workings; that the area of coal workable even with our present means is larger than has been estimated; that the magnesian limestone and new red sandstone beds are likely to afford an opening for new stores of coal quite incalculable in amount; that the theory of an increase of consumption in a geometrical ratio is not tenable; and that we shall probably economize consumption in future years by the adoption of new processes, new furnaces, new stove-grates, smoke-consuming apparatus, and the utilization of waste heat and gases. Although entertaining these favorable views, he nevertheless suggested official inquiry. The government assented; and a royal commission, comprising the duke of Argyle, sir Roderick Murchison, sir W. G. Armstrong, Mr. Vivian, Mr. Prestwich, Dr. Percy, Mr. Jukes, Mr. Robert Hunt, and several other experienced men, was appointed in July, 1866.

The coal commissioners gradually collected a large body of information concerning the quantity of coal raised annually in the United Kingdom; the probable future rate of increase; the quantity still remaining at available depths underground; and the best means of economizing coal in future. They obtained a great mass of evidence, which was published in 1871, with maps, plans, and diagrams. They reported that the deepest of our mines are about 2,000 ft., but that 4,000 ft. might possibly be worked with improved lifting and ventilating appliances. They estimated the coal of the United Kingdom, at all depths down to 4,000 ft., at 90,207 million tons—viz., 46,000 millions in England; 34,000 millions in Wales; 10,000 millions in Scotland, and a mere trifle in Ireland. The largest single coal-field they found to be that of South Wales, 32,000 million tons. Many geologists believe that coal underlies the new red sandstone and permian formations, and that an additional quantity of 56,000 million tons might possibly be obtainable from this source. Supposing the available total to be 146,000 million tons, the commissioners endeavored to estimate how long it would last. The quantity raised in 1869 was 107,000,000 tons, of which 97,000,000 were retained for home consumption. Taking into account all the circumstances which had to be considered, the commissioners expressed an opinion that our coal-supply will be exhausted in 300 years.

Since 1871, the subject has been much discussed. The balance of opinion tends towards a greater duration than 300 years; but all is vague guessing on this point. The coal-harvest of Great Britain in 1872 was 123,000,000 tons; in 1873, 127,000,000 tons; and in 1876, 133,000,000 tons.

Consequent on the revelations concerning our (future) coal-famine, other nations have made renewed investigations respecting their own reserve deposits.

COAL-TAR. See GAS-TAR.

COAL-WHIPPING, the name given to a mode of unloading coal from vessels at anchor in the Thames. About 2,000,000 tons of coal are annually transferred from vessels in the river to barges, which convey them to the wharves. The operation is called coal-whipping, and the men, *coal-whippers*—names, the origin of which does not seem to be known. The men work in gangs of nine—a *basket-man* and eight others. Some of them shovel the coal from the hold of the ship into baskets or boxes; some haul up the boxes by ropes and pulleys; and some empty the contents into the barges.

This is all the operation—a mere example of muscular labor of the coarsest kind. It would not have called for notice in this work, had not legislative interference given a factitious importance to it. Some years ago, when the number of these men was about 2,000, public-house keepers got into the habit of acting as middlemen, a position which gave them the power of compelling the men to spend nearly all their earnings in drink. The trade fell into such a state, that the men were virtually slaves to the publicans. They asked for the interference of the legislature; and this was granted in 1843. An act was passed expressly for these 2,000 coal-whippers. A coal-whippers' board was formed, comprising members named by the board of trade, others named by the corporation of London, and one by the shipowners' society. This board assumed the functions

of a middleman or master coal-whipper; contracted for the whipping of ships of coal, and employed the men. No one but men registered on the books of the board was allowed to work on the Thames as a coal-whipper, with the exception of the crews of the ships and the servants of the coal-owners. This exceptionally-protected trade was maintained on the same basis by other acts passed in 1846 and 1851. In 1856, however, a further renewal was refused; and a committee of the house of lords, in 1857, while sympathizing with the men, declined to recommend any further special legislation for them. The coal-owners agreed with the board of trade to maintain a whipping office, to give the men a refuge from the publicans, but without interfering with the liberty of coal-shippers to employ whom they pleased; and this plan has since been acted on. The office is at the coal exchange, with a men's rendezvous near Ratcliff. The necessity for coal-whippers has been much lessened of late years by the use of a floating derrick in the Thames, by which the contents of a coal-ship can be transferred to the barges in a few hours by steam-power.

COAM'INGS, in a ship, are small frame-works on the deck, to prevent sea and rain water from running down the hatchways, ladder-ways, and scuttles.

COAN, TITUS, D.D., b. Conn., 1801; ordained a Congregational minister in Boston in 1823, and in that year made a trip of exploration to Patagonia, where he wished to establish a mission. Circumstances being unfavorable, he returned, but soon afterwards he went to the Sandwich islands and was stationed as a missionary at Hilo. Besides his work as a missionary he has published in the *American Journal of Science* and elsewhere many valuable papers on scientific subjects.

CÖAN'ZA, a river of Lower Guinea, western Africa, which, after a course of about 500 or 600 m., enters the Atlantic s. of St. Paul de Loando, in lat. about 9° 10′ s. It is navigable for a considerable distance, but a bar at its mouth renders it inaccessible save to small vessels.

COAST-GUARD, an organization formerly intended to prevent smuggling merely, but now constituted so as to serve as a defensive force also. The old coast-guardsmen were in the employment of the customs department; they were posted along the shore at spots commanding extensive views of the beach, and were expected to be always on the look-out for smugglers. In 1856, the coast-guard was transferred to the admiralty, and under this arrangement the admiralty may, from time to time, issue orders for the augmentation of the coast-guard, not to exceed 10,000 men in all. Lands, not exceeding three acres each, may be bought by the admiralty for coast-guard stations. The coasts of the United Kingdom have been divided into 9 districts. Each district is under a navy captain, who has an iron-clad guard-ship at some port in the district. All the revenue cruisers and defense-gunboats are attached as tenders to the ships, and are manned therefrom. The able seamen, borne on the ships' books, and employed on shore in coast-guard service, are in three classes—chief boatmen, commissioned boatmen, and boatmen. They receive high sea-pay, besides 1*s.* 4*d.* per day in lieu of provisions, and house-rent and medical attendance free. In war-time, all of these men may be called upon to serve as regular sailors on board ship; but their families are allowed to live rent-free during this time. The coast-guard are taught naval gunnery, gunboat exercise, and the serving of land-batteries. The guard-ships are also employed as training-ships for the navy. The whole of the coast-guard comprised, in 1879, 4,300 men, and the charge for their maintenance and that of their ships is about £500,000.

COASTING-TRADE, the commerce carried on by sea between the different ports of the same country. In Great Britain, "coastwise" is defined to mean "from any one part of the United Kingdom to any other part thereof." Vessels engaged in this commerce are subject to different rates and regulations from over-sea traders, and the masters must keep books showing that their cargoes come strictly within the definition of coasting-trade. Formerly, no goods or passengers were allowed to be carried from one port of the United Kingdom to another, except in British vessels; but this restriction was repealed in 1854, and the coasting-trade of Great Britain is now open to all the world. In other countries, the exclusive policy still prevails. The regulations under which the coasting-trade are conducted are contained in the customs consolidation act, 16 and 17 Vict. c. 107 (see M'Culloch's *Commercial Dictionary*).

COASTING-TRADE (*ante*). This trade in the United States is far more extensive than in any other country. Of the 38 states now in the union, 18 border on the Atlantic ocean and the gulf of Mexico, and two border on the Pacific, to which may be added the territory of Washington, and the enormous coast-line of the newly acquired territory of Alaska. There is an immense amount of coastwise trade, especially along the Atlantic and the gulf. In the time of the early settlements such trading was done in small shallops, sloops, and schooners, and there was very little of it. The introduction of steam-vessels made a great change, and the trade rapidly grew in importance. At the present time many hundreds of steamers and more hundreds of sailing craft are constantly plying from Maine to Texas, transferring the cotton, sugar, and rice of the southern to northern, and the lumber, grain, and manufactured goods of the northern to southern markets. The swift propeller brings the oranges and strawberries of Florida

to Maine, and takes back the ice of the Penobscot. In summer, these coasting steamers do a large share of the passenger as well as trade traffic. The thoroughness of the coast survey, and the recent introduction of the weather service whereby mariners are duly forewarned of danger, have done much to prevent the disasters which were common not long ago, and even the dreaded cape Hatteras has lost much of its terror.

COAST-LINE, the ocean boundary of any continent, island, or section of land. Such lines vary in length with the amount of indentation by gulfs and bays. Europe has nearly 20,000 m. of coast-line; Africa, 15,000; Asia, 30,000; North America, 23,000, and South America, 15,000.

COAST RANGE, or COAST MOUNTAINS, in California, running in a course almost parallel with the ocean from near the boundary of Oregon into Lower California. The range has a width of 30 to 40 m., and has numerous spurs which usually run toward the ocean. Between these are well-watered and exceedingly fertile valleys. The chief peaks of the range are San Bernardino, 11,600 ft.; Helena, 3,700. The principal passes are from 686 to 3,780 ft. above sea level. The mountains are usually rocky and steep. Those near the sea are covered with timber, while those far inland are nearly bare.

COAST SURVEY, a scientific department of the government of the United States, established for the purpose of making geodetic and hydrographic surveys to determine the coast-line, and of making charts of harbors and tide-waters, and of the bottom of the ocean along the coast. It extends its observations to all parts of the globe, as may be thought serviceable to navigation; and it makes such other observations (as of the tides and currents, and of the nature of the sea and river bottoms) as will permit calculations of changes to be expected in the future. Its office is also to indicate positions for the erection of light-houses and all other useful signals, and to make various meteorological and other observations. The inception of the organization was contemplated in the message of president Jefferson to congress in 1807. An act was passed authorizing him to cause a survey of the coasts of the United States, including islands, shoals, and places of anchorage within 20 leagues of the shore, and of St. George's bank; and to take soundings and observations upon currents beyond such limits, to the gulf stream. This act appropriated $50,000 for the object. Plans were requested from scientific men, and that proposed by Mr. F. R. Hassler, a native of Switzerland, was adopted. It was, in the first place, to determine the positions of certain prominent points of the coast by astronomical observations, and to connect them by trigonometrical lines from which to make a nautical survey; but nothing was done till 1811, when he went to Europe to obtain instruments and material for the work. He was, however, detained till the close of the war with Great Britain. On his return he was appointed superintendent of the coast survey, but did not begin active labors till 1817, when, in the vicinity of New York, he measured a base-line west of the Palisades on the Hudson, for the triangulation of New York harbor; but the work was not extended beyond this, for want of funds, except that a few detached surveys were made by the navy, and by the topographical engineers of the army. An interval of ten years elapsed, and in 1832, after a small appropriation had been made by congress, Mr. Hassler resumed the active duties of his office, and was authorized to employ, in addition to the naval and army officers designated for that service, such astronomers and other persons as he might deem necessary. He continued to superintend the survey till his death, in 1843. The work which he accomplished was to extend the survey at New York as far eastward as Point Judith, R. I., and as far s. as cape Henlopen, Del. The triangulation extended over an area of 9,000 sq. m., determining the positions of about 1200 stations, to be used in the delineation of about 1600 m. of shore line. Mr. Hassler was succeeded by prof. A. D. Bache. In 1845, surveys were begun on the coasts of Virginia and North Carolina, and during the next two years they were extended to Georgia and the gulf states, and afterwards to the Florida reefs and keys. Many observations on the gulf stream were taken during the time of the superintendency of prof. Bache, and extended observations were made upon the tides and currents in various rivers, for the purpose of deducing the laws by which they are governed. The magnetic force and direction in parts of the earth included in the survey were observed, and various meteorological observations were taken for the purpose of investigating the laws of storms. The rebellion interrupted the operations of the survey along the coast of the southern states, but many of the coast-survey officers were with the United States vessels, and their knowledge was of the utmost importance in naval operations. Two years after the close of the war, prof. Bache died (1867), and prof. Benjamin Pierce, of Harvard university, was appointed his successor. Since then a more comprehensive system has been prosecuted, extending across the continent; and the Pacific coast has been the subject of extended triangulation, although still far from complete; and the hydrographic survey has been actively carried on. See HYDROGRAPHY, GEODESY, and TRIANGULATION.

COAST VOLUNTEERS, or ROYAL NAVAL COAST VOLUNTEERS, is a corps organized for the special defense of the coasts of the United Kingdom, separate from, but in connection with the coast-guard (q.v.). By an act of parliament passed in 1853, the admiralty was empowered to raise a number, not exceeding 10,000, of C. V., to consist of sea-faring men and others, to be entered for five years' service, and to be exercised 28 days in each year, either on shipboard or on shore; but not to be sent more

than 50 leagues from the coasts of the United Kingdom, unless in cases of emergency, when the distance might be extended to 100 leagues. One year's active service entitles them to discharge in ordinary cases; but in emergencies, they may be called out a second year on receipt of higher pay. Their pay, allowance, and rank during exercise and active service is the same as able seamen's. The bounty to be paid on entering, and the arrangements for arms, clothing, and accoutrements, are left for the admiralty to settle from time to time. An act passed in 1856 invested the command of the C. V. in the coast-guard, the officers of which are to superintend the training and exercising. As a matter of fact, the force is a very small one (600), and a failure.

COAT OF ARMS, in the military trappings of the middle ages, held the place of the *paludamentum* of the ancient Roman captains. It was a coat worn by princes and great barons over their armor, and descended to the knee. It was made of cloth of gold or silver, of fur or of velvet, and bore armorial insignia. The "coat of arms," as understood by heraldry in the present day, is nothing more than a relic of the ancient armorial insignia, divested of the coat on which it used to be embroidered. See SHIELD, HERALDRY.

COATBRIDGE, a rising and prosperous t. of Scotland, in the parish of Old Monkland, about 8 m. directly e. of Glasgow, on the Monkland canal and Caledonian railway. The town is straggling, has some good houses, and a number of small villages or suburbs on its outskirts. There are six churches besides the parish church, two academies, and several other schools, banks, etc. The town is in the center of a mineral district, is surrounded by about 50 smelting-furnaces, and contains 8 malleable-iron works, one tin-work (the only one in Scotland), and several other works connected with the iron manufacture. C., owing to the great increase in the iron trade, has grown very rapidly in size and prosperity within the last 30 years. Pop. '41, 1599; '51, 8,564; '61, 10,501; '71, 13,624; and still rapidly increasing.

COATI, or COATI-MONDI (*nasua*), a genus of quadrupeds of the family *ursidæ* (the bear family); by some naturalists referred to *viverridæ* (the civet family), although their *plantigrade* character allies them rather to the former. They are most nearly allied to the raccoons, and, like them, are exclusively American. They are chiefly remarkable for the elongation of the snout, which is a sort of flexible proboscis, and is turned about in search of food, and employed in rooting up the earth to obtain worms and insects. They are often domesticated in South America, and are very affectionate, active, troublesome, and amusing.

COAT OF MAIL, in the armor of the middle ages, was a suit made of metal scales or rings, linked one within another. See ARMOR.

COATZACOAL'CO, a river of Mexico rising in the Sierra Madre, flowing partially across the isthmus of Tehuantepec, and emptying into the gulf of Mexico. This river, and the region around, have been several times explored with the view of constructing a canal across the isthmus from the gulf to the Pacific, the river being considered an important element in the work.

COBALT (from *Cobalus*, a malicious sprite or gnome) is a metal of no use in the arts and manufactures, but which forms compounds of commercial importance. C. (symbol Co) is found naturally in combination with arsenic (As), as *speiss C.* (CoAs); in combination with arsenic and sulphur, as *C. glance*, the arsenide and sulphide of C. (CoS_2, CoAs), in ores of nickel (q.v.); and in the metallic state, it is found in meteoric stones or aërolites (q.v.). The metal has been obtained in laboratory experiments, and presents a gray color with a reddish tinge, is highly magnetic, and is as hard and infusible as iron. It is a brittle metal, and forms no alloys of commercial use. The protoxide of C. (CoO) is employed in painting on porcelain, for producing a rich blue color. *Zaffre* is the impure oxide obtained by partially mixing C. ore with two or three times its weight of fine sand. *Smalt* is the term applied to a deep blue glass, which owes its color to the presence of oxide of C., and which, when reduced to very fine powder, is employed occasionally by laundresses to correct the yellow color of newly washed linen, and by paper-makers as a blue pigment for staining writing-paper. Smalt is also used in the production of the blue colors in porcelain, pottery glass, encaustic tiles, fresco painting, etc., and forms the principal ingredient in *old Sevres blue*, *Thenard's blue*, *turquoise blue*, and *variegated blue*. See BLUE. A compound containing the oxides of C. and zinc is of a beautiful green color, and is known as *Rinman's green*. The chloride of C., dissolved in much water, may be employed as a sympathetic ink. In dilute solutions, it is of a faint pink color, which is not observable when it is used for writing upon paper; but when heated before the fire, it loses water, and becomes blue, and the writing is then capable of being read. On allowing the paper thereafter to lie in a damp place, or exposing it to the vapor of steam from a kettle, water is again absorbed, and the writing returns to its invisible state. The addition of a little perchloride of iron to the ink, makes the writing appear green; a solution of zinc imparts a red tint; and a salt of copper, a yellow shade.

COBAN', a t. of Central America, Guatemala, in the dep. of Vera Paz, in a fertile valley on the Rio Dolce, 55 m. n. of the town of Guatemala. The inhabitants are nearly

all Indians, are generally industrious and some of them wealthy, and possess plantations of sugar-cane, bananas, pimentos, and various kinds of fruit-trees. Pop. estimated at 14,000.

COBB, a co. in n.w. Georgia on the Chattahoochee river, intersected by the Western and Atlantic railroads; 529 sq.m.; pop. '80, 20,748—6,010 colored. Surface hilly and in part mountainous, soil fertile. Gold has been found. The main products are wheat, corn, cotton, and butter. Co. seat, Marietta.

COBB, DAVID, 1748–1830; b. Mass.; graduated at Harvard, and became a physician. He was an officer in the revolutionary army, member of congress, judge of the common pleas, and lieutenant-governor of Massachusetts.

COBB, HOWELL, 1815–68; b. Ga., graduated at Franklin college, and admitted to the bar in 1836. In 1843, he was sent to congress, where he served until 1851. In 1849, he was elected speaker of the house. He was one of the leaders of the southern party in congress, and favored the extension of slavery into the territory acquired from Mexico. In 1851, he was chosen governor of Georgia, and again to congress in 1855. He was secretary of state in Buchanan's cabinet, resigning Dec., 1860, to join the south in the approaching war. He was the first president of the confederate congress, and afterwards a maj.gen., but made no military reputation.

COBB, SYLVANUS, D.D., 1799–1836; b. Me.; a minister in the Universalist church. He edited a newspaper for 20 years, and wrote a *Commentary on the New Testament*, and other works. His name is more widely known through the literary work of his son Sylvanus, b. 1823, a prolific writer of tales and sketches for many years past.

COBBE, FRANCES POWER, 1822–80; an English authoress, a great-granddaughter of Charles Cobbe, archbishop of Dublin. She became interested in religious studies, and was for a long time a personal friend and admirer of Theodore Parker, editing the English edition of his works, and being with him at Florence in the last days of his life. She traveled in Italy and the east, giving her observations in the *The Cities of the Past*. Among her other works are *Studies New and Old of Ethical Subjects; Hours of Work and Play; Essay on Intuitive Morals; Religious Duty;* and *Darwinism in Morals, and other Essays*.

COBBETT, WILLIAM, a celebrated English political writer, was b. in Mar., 1762, at Farnham, in Surrey, where his father was a small farmer. From his infancy, he was trained in habits of industry and self-dependence. Taking a dislike to rural occupations, he went to London, where he was employed a few months as a copying-clerk—a kind of employment so distasteful to him, that he enlisted into the 54th foot, and with it went out to Nova Scotia shortly after. In this regiment he remained about eight years, in the course of which time his uniform good conduct, activity, and intelligence had secured him the high promotion of sergeant-major. During his soldier-years, he indulged in none of the dissipations common to barrack-life, but devoted the whole of his leisure to the work of self-education. On his return to England, about the end of 1791, he obtained his discharge, married, and went to America in the following year. He settled in Philadelphia, where he commenced his career as a political writer. Under the signature of "Peter Porcupine," he was at this early stage as keen a tory as in later life he was a radical, and he lashed French republicanism and American democracy with a scorn as coarse and personal sometimes as it was always bitter. In America, he was twice prosecuted for libel. He left America in June, 1800, and returned to England. In Jan., 1802, appeared the first number of his famous *Weekly Political Register*, which he continued without intermission until his death in 1835. At first, tory, the *Register* gradually changed its politics, until at last it became the most fierce and determined opponent of the government, then presided over by Pitt, and the most uncompromising champion of radicalism. In 1810, having previously been twice tried and found guilty of libel on certain members of the government, he was sentenced to imprisonment for two years in Newgate, and to pay a fine of £1000, for having in the *Register* made some severe remarks upon the flogging of five militiamen. In 1817, in consequence of pecuniary embarrassments, and the dread of being sent to Newgate again, under the six acts for the suppression of freedom of discussion, C. went once more to America, where he remained more than two years, his articles for the *Register* being transmitted with unfailing regularity across the Atlantic. In 1829–30, C. delivered political lectures in several of the principal towns of England and Scotland, and everywhere met with a most enthusiastic reception as the boldest and most powerful advocate of the people's rights. In 1832, he was returned to the first reformed parliament as one of the members for Oldham. His speeches in parliament, however, did not add to his reputation. He died June 18, 1835. Among C.'s best known works are his *English Grammar; Rural Rides; Cottage Economy; Advice to Young Men and Women;* and *Parliamentary History*. C. was by no means a man of the first order of intellect; he was shut out altogether from the higher and more refined departments of human thought. But in dealing with matters of common-sense merely, he exhibited a native vigor far surpassing that of any writer of his day. Nor can there be any doubt that, in spite of his crotchets, he rendered lasting service to the cause of the people. See Smith's *Life of C.* (1878).

COB'DEN, RICHARD, an eminent English politician, who was very aptly designated "the apostle of free-trade," was b. at Dunford, near Midhurst, Sussex, in 1804. His father, who was the owner of some little property, which he cultivated himself, died while the subject of this article was yet young, leaving his family in comparatively poor circumstances. Richard was received into a wholesale warehouse belonging to his uncle, where he soon exhibited great aptitude for business. After some time, he became a partner in a Manchester house, his presence here being speedily made manifest by the superior quality and tastefulness of the printed calicoes of the firm. In 1834–35, C. traveled in Turkey, Greece, and Egypt, and also visited the United States, the result of his travels appearing in two pamphlets, entitled respectively *England, Ireland, and America*, and *Russia;* the latter intended as an antidote against the "Russophobia" then prevalent. In these pamphlets, he also ridiculed the workings of diplomacy, and asserted England's mission to be the avoidance of war and the extension of commerce. In 1837, he contested unsuccessfully, on free-trade principles, the borough of Stockport; and in 1838 he carried in the Manchester chamber of commerce a motion to petition parliament for the repeal of all duties on corn. This was followed by similar action all over the country; and in the following year, petitions bearing some two millions of signatures for the repeal of the corn-laws were carried to London by 200 delegates. The motion of Mr. Villiers for repeal being rejected by a large majority of the house of commons, the friends of free-trade determined to form the anti-corn-law league (q.v.), of which C. became the most active and prominent member. To his lectures all over the country, and his speeches in parliament (to which he was returned in 1841 by the constituency which rejected him in 1837), all characterized by great information, clearness, and acute and convincing reasoning, was in great part due, as sir Robert Peel acknowledged, the abolition of the corn-laws at so early a period as 1846. Having accomplished this great work, C. again visited the continent, and during his absence he was elected both for Stockport and the West Riding of Yorkshire. He chose the latter constituency, which he continued to represent till 1857, when, on an appeal to the country by lord Palmerston to support him in his Chinese policy, of which C. was a strenuous opponent, he was rejected. Shortly after the repeal of the corn-laws, the public testified its gratitude to him for the services he rendered in this matter by subscribing for him a magnificent testimonial of between £60,000 and £70,000. C. now gave up business, and devoted himself exclusively to politics. He continued to labor assiduously for the extension of free-trade principles, for parliamentary and financial reform, for repeal of the taxes on knowledge, and was particularly earnest in enunciating national and international peace views; and to this feeling with regard to war, he owed his rejection at the general election of 1857. In 1859, having in the interval, on account of ill health, retired from politics altogether, he was, during his absence in America, elected to Rochdale. Lord Palmerston, who was at this time called upon to form a new ministry, with a just appreciation of the great services which C. had rendered to his country, offered him a seat in the cabinet, which C., as the uncompromising opponent of the noble lord's foreign policy, felt bound to decline. After his election for Rochdale, the state of his health did not permit him to take any part in parliamentary proceedings, but as her majesty's plenipotentiary, he (1859–60) arranged and concluded a treaty of commerce with France. C. spoke out strongly in favor of the north during the American civil war. He died April 2, 1865.

COBI'JA, a t. of Bolivia, claims notice chiefly as being the only seaport of the republic. It is situated in lat. 22° 34′ s., long. 70° 21′ w., and forms the capital of the department La Mar. Its pop. is less than 3,000, and its trade inconsiderable, for besides the disadvantage of an open roadstead to seaward, there extends inland the almost impracticable desert of Atacama. Hence most of the maritime commerce of the state (see BOLIVIA) passes, and that in the face of transit-duties, through the Peruvian harbors to the northward.

COBI'TIS. See LOACH.

COB'LE, or COB'BLE, is a low flat boat with a square stern, mostly used by salmon-fishers.

COBLEIGH, NELSON EBENEZER, D.D., LL.D., b. N. H., 1814; a graduate of Wesleyan university; professor in McKendree college, Ohio; in Lawrence university, Wis.; president of East Tennessee Wesleyan university; and editor of two Methodist newspapers, *Zion's Herald*, Boston, 1858, and the *Methodist Advocate*, Atlanta, Ga., 1872.

COBLENZ, a city of Rhenish Prussia, beautifully situated at the junction of the Rhine and the Moselle, the former of which is here crossed by a bridge of boats, and the latter by a fine stone bridge. Being a bulwark of Germany against France, C. is defended by extensive fortifications, forming a fortified camp capable of affording accommodation for 100,000 men. For defense-purposes, C. is connected with the almost impregnable castle of Ehrenbreitstein (q.v.), on the opposite side of the Rhine. Several detached forts also guard the city at various points. In the old town of C., many of the streets are irregular, narrow, and dirty; but in the new town they are generally well built, moderately wide, and cleanly. Among its principal buildings are the church of St. Castor, founded early in the 9th c.; the town-hall; the old castle of the electors of

Treves, repaired in 1845; and the old Jesuit college, now a *gymnasium*. The favorable position of C. secures it an active commerce in wine, corn, mineral waters, etc. It manufactures champagne, cigars, japan-ware, and furniture. Many of the inhabitants are employed in vine culture. Pop. '75, including a garrison of about 4,600 men, 29,290. C. was known to the Romans as *Confluentes*. Till 1796, it belonged to the elector of Treves. In 1798, it was made the capital of the new French department Rhine-Moselle, and in 1815, was given to Prussia.

COB-NUT, a name given to some of the largest and finest cultivated varieties of the hazel-nut (q.v.).—In the West Indies, the name cob-nut is given to the fruit of *omphalea triandra*, a tree of the natural order *euphorbiaceæ*. It is also called hog-nut. The tree has a white juice, which turns black in drying, and in Guiana is used instead of ink. The fruit is a three-celled capsule, each cell containing one seed or nut, which, if the embryo is retained, has very cathartic properties, but after its extraction, is wholesome and pleasant.

COBOURG, a t. in Canada, in Northumberland co., on lake Ontario and the Grand Trunk railroad; 69 m. n.e. of Toronto; pop. '71, 4,422. It is the seat of justice of both Durham and Northumberland. Victoria college is in this town.

CO'BRA DA CAPEL'LO, a name sometimes limited to the *naja tripudians*, and sometimes extended to all the species of the genus *naja*, very venomous serpents of the family *viperidæ*, remarkable for the faculty of dilating the back and sides of the neck, which they do when angry or otherwise excited, and to which they owe their popular name, originally Portuguese, and signifying *hooded snake;* the elevated skin of the back of the neck presenting, when the animal is viewed in front, much the appearance of a hood. It is usually three or four feet long, of a pale rusty-brown color above, and bluish or yellowish-white below, and is characterized by a singular mark on the back of the neck, closely resembling the figure of an old-fashioned pair of spectacles, from which the animal sometimes receives the name of the *spectacle snake*. The C. da C. preys on lizards and other small animals. It is usually a sluggish creature, and is easily killed, even by means of a small stick or a whip. Its venom is extremely powerful, its bite causing death in two hours or less. Yet it is little disposed to use its fangs, except for the purpose of providing itself with food. The C. da C. is often to be found in the vicinity of human dwellings in the East Indies, and even in the houses themselves, attracted apparently by the young of the domestic poultry, and by the moisture of the wells and drainage. When one is found in or near a house, its mate is seldom far off. The Singhalese, when obliged to leave their houses in the dark, carry a small stick with a loose ring, the noise of which, as they strike it on the ground, warns the snakes to leave the path. The poison of the C. da C. is secreted in a large gland in the head of the serpent, which, when the animal compresses its mouth upon any object, flows through a cavity of the tooth into the wound. The poison, though most deadly when introduced into the system through a wound, possesses the curious property of being perfectly harmless if taken internally. Olive oil applied externally, and ammonia taken internally, cauterizing, and ligatures immediately applied, may save the life; but the poison is so deadly, that instances of recovery of bitten persons are very rare. See Buckland's *Curiosities of Natural History*, and Fayrer's *Thanatophidia of India* (Lond.: Churchill). The other species of *naja* are found in the warm parts of Asia, Africa, and Australia.

CO'BURG, a t. of Central Germany, in the duchy of Saxe-Coburg-Gotha, picturesquely situated on the left bank of the Itz, a tributary of the Regen, in lat. 50° 15′ n., and long. 10° 58′ east. In the market-place are some striking old buildings, but the general appearance of the houses is one of cleanliness and comfort. C. is one of the chief ducal residences, and the palace, a Gothic edifice, erected in 1549, is one of the principal buildings in the town. The old castle of the dukes of Coburg, now partly used as a house of correction and prison, occupies a commanding height more than 500 feet above the town. The rooms, and the bed which Luther occupied when in concealment here in 1530, are still exhibited to the visitor, as well as the pulpit from which he preached in the chapel of the castle. During the thirty years' war, the castle was ineffectually besieged by Wallenstein. C., which is the seat of all the high courts of the duchy, has manufactures of woolen, linen, cotton, marquetry, baskets, porcelain, furniture, and carriages, and exports beer. Pop. '75, 14,567.

COBURG FAMILY, a German ducal family dating from the 15th c., remarkable for alliances with the English and continental royal houses. Queen Victoria's mother was a sister of duke Ernest I. The first wife of Ernest's brother Leopold (king of Belgium) was a daughter of George IV. of England, and his second wife was a daughter of Louis Philippe. Albert, the son of Ernest I., was the husband of Victoria.

COBURG PENINSULA, the most northerly part of Australia to the w. of the gulf of Carpentaria, runs out in a n.w. direction towards Melville island, from which it is divided by Dundas strait. On its n.e. side is the bay known as Port Essington, at the head of which, about lat. 11° 22′ s., long. 132° 10′ e., was established, in 1839, the settlement of Victoria—abandoned, on account of its insalubrity, six years thereafter.

CO'CA, *Erythroxylon coca*, a shrub of the natural order *erythroxylaceæ*, of which the leaves are much used by the inhabitants of Peru and Bolivia as a narcotic and stimulant. The dried leaves are chewed with a little finely powdered unslaked lime, or with the alkaline ashes of the quinoa (q.v.), or certain other plants. An infusion is also occasionally used. The properties and effects of C. resemble those of opium, although it is less narcotic, whilst it possesses the property of dilating the pupil of the eye, which opium does not possess. It also lessens the desire for ordinary food, and for some time, at least, enables the person who uses it to endure greater and more protracted exertion than he otherwise could, and with less food. It is especially remarkable for its property of preventing the difficulty of respiration, so common in the ascent of long and steep slopes at great elevations. But when used habitually and in excess, it weakens the digestion, produces biliary and other disorders, and finally induces a miserable ruin both of body and mind. It has been in use from a very remote period among the Indians of South America, and was extensively cultivated before the Spanish conquest. Many of the Indians of the Peruvian Andes are to this day excessively addicted to it, and its use is quite general among them, besides prevailing to a considerable extent among the other inhabitants of the same regions. Its culture and use have extended into Brazil and the countries on the banks of the Amazon, and it is supposed that about 30,000,000 lbs. of the dried leaf are consumed in a year, about 10,000,000 of the human race partaking in the indulgence.

COCCE'JI, HEINRICH FREIHERR VON, b. at Bremen, Mar. 25, 1644, studied jurisprudence and philosophy in Leyden from 1367 to 1670, and went from thence to England. In 1672, he was made professor of the law of nations at Heidelberg; in 1689, he accepted the professorship of jurisprudence at Utrecht; and, in the following year, was appointed to a similar office at Frankfort-on-the-Oder. In 1713, the emperor named him a baron of the realm, on account of his good management of several important affairs. C. died Aug. 17, 1719. As an erudite jurist, C. was the oracle of many courts, and his work on German civil law (*Juris publici prudentia*, 1695) was almost universally used as an academical text-book for this branch of jurisprudence.—His youngest son, SAMUEL, b. at Heidelberg in 1679, acquired no less renown. He, too, in 1703, became professor at Frankfort-on-the-Oder, and afterwards filled several honorable state offices. At last, he was appointed great chancellor, in which function he died, Oct. 22, 1755. His reform of the Prussian administration of justice, and his *Codex Fridericianus* (Berlin, 1747–50), are among the greatest benefits his country owes him.

COCCE'JUS, or **COCK,** JOHANNES, a distinguished theologian, was b. at Bremen, Aug. 9, 1603. After preparatory studies in his native place, he, in 1625, went to Hamburg, where he studied Hebrew. From thence he went to Franeker in 1629. Returning to Bremen in 1630, C. was appointed professor of Hebrew at the athenæum of his native place; called to Franeker for the same office in 1636, and in 1643 appointed professor of theology also. In 1650, he became professor of theology at Leyden, where he died in 1669. C.'s chief work is the *Lexicon et Commentarius Sermonis Hebraici et Chaldaici Veteris Testamenti* (Leyden, 1669) the first tolerably complete dictionary of the Hebrew language. The irrelevant and inaccurate matter which it originally contained, has been weeded out in the course of time by more skillful editors. In spite of his great learning, C. held very peculiar hermeneutical principles, which enabled him to discover the whole New Testament in the Old. The result, of course, was that he virtually transferred the language of the Old Testament to the New. The representation abundantly employed in the former of a covenant between God and man, usurped the place of the New Testament doctrine of the Fatherhood and Sonship; and his theology is simply a modern renewal of the old attempt to Judaize Christianity, which Paul denounced and condemned. C. carried the covenant theology, as it is called, to an absurd extreme. The most complete exposition of his views is in his *Summa Doctrinæ de Fœdere et Testamento Dei* (1648). C.'s principal antagonists were Voetius and Desmarets.

COCCINEL'LA. See LADY-BIRD.

COC'CO, CO'COA ROOT, or ED'DOES, plants of the genus *colocasia*, and of the nearly allied genus *caladium*, of the natural order *araceæ*, very generally cultivated in tropical and sub-tropical countries for their roots, or flat underground corms, which abound in starch, and are used as articles of food, being deprived by roasting or boiling of the characteristic acridity of the order, which, indeed, some of them possess in a comparatively small degree. They are sometimes included under the name *yam*, but are totally different from the true yams. The names cocco, cocoa root, and eddoes, perhaps more strictly belong to *colocasia antiquorum*, a stemless plant with ovate leaves, and flowers inclosed in a cylindrical erect spathe. The taste of its roots is like that of potatoes. *Colocasia esculenta* is a similar plant, a native of tropical America, and is much cultivated. *Colocasia macrorhiza* is the tara (q.v.) of the South Sea islands. In the Himalaya, *C. Himalensis* forms the principal food of many of the inhabitants. The root in its recent state is stimulant, diaphoretic, and expectorant.

COC'COLITHS and COCCOSPHERES, bodies called "bathybius" by Huxley. They are round, or nearly so, and adhere to gelatinous protoplasm found in submarine localities. Prof. Huxley divides the coccoliths into discoliths and cyatholiths, and de-

scribes the discoliths as "oval discoidal bodies with a thick, strongly refracted rim, and a thinner central portion, the greater part of which is occupied by a slightly opaque cloud patch, corresponding to the inner edge of the rim, from which it is separated by a transparent zone;" usually they are concave on one side and convex on the other, the rim being raised on the convex side. In diameter they are one five-thousandth of an inch. The cyatholiths are a little larger, and of the shape of minute studs or buttons. Coccospheres are either compact or loose in texture, and vary from a thirteen-hundredth to the 760th of an inch in diameter. Dr. Wallich thinks that the coccospheres are the progenitors of the coccoliths; and both are the calcareous parts of bathybius. They are found fossil in chalk.

COCCOLOBA. See SEASIDE GRAPE.

COCCOMIL'IA, or COCUMIGLIA, *Prunus coccomilia*, a species of plum, a native of Calabria, and of which the bark—particularly of the root—is much used in that country for the cure of intermittent fevers. Its valuable qualities have been strongly attested by Neapolitan physicians, and it is employed both in private practice and in military hospitals, but it has not come into use in other countries. The C. has obovate leaves, short double flower-stalks, and austere tawny-yellow fruit.

COCCOS'TĔUS, a genus of fossil fishes, peculiar to the Devonian measures. It was nearly related to cephalaspis (q.v.), but differed in having, in addition to the bony helmet of that genus, a cuirass covering both the dorsal and ventral aspects of the body as far down as the origin of the dorsal fin, from which to the tail—comprising more than one half the entire length of the animal—all seems to have been exposed without the protection even of a scale. In a well-preserved specimen in the British museum, the remains of the endo-skeleton can be detected. Seven species have been described from the bituminous schists of the old red sandstone of the north of Scotland.

COCCOTHRAUS'TĒS. See HAWFINCH.

COC'CULUS IN'DICUS, the name given commonly, and in the pharmacopœias, to a very poisonous seed, brought from the East Indies, which is used for various medicinal purposes, and illegally in the preparation of malt liquors. It possesses acrid and intoxicating qualities. It is used in India for stupefying fish, that they may be taken by the hand. An ointment made with it is a very efficacious remedy for ringworm. It contains a most poisonous principle, called *picrotoxine*, whilst the pericarp contains another called *menispermine*, equally poisonous. It is the seed of the *anamirta cocculus*, a beautiful climbing plant, of the natural order *menispermaceæ*. It imparts to beer its bitter taste, and at the same time a fullness and apparent richness, but renders it very deleterious in its effects. It has been frequently asserted that C. I. is used to a considerable extent by British brewers, but according to the report of the laboratory department of the inland revenue office issued in 1876, there is little ground for this belief, as in no case were the officers of the department able to discover the drug in any brewer's premises, or in any samples of beer. Of the large quantity imported, almost the whole is again exported, chiefly to Germany.—The genus *anamirta* is closely allied to the genus *cocculus* (see CALUMBA), in which it was formerly included. The fruit of several allied species possesses properties analogous to those of the *A. cocculus*.

COC'CUS (Gr. *kokkos*, kermes), a genus of insects of the order *hemiptera*, sub-order *homoptera*, the type of a family, *coccidæ*, allied to the *aphis* (q.v.) family, although in many respects very distinct. The *coccidæ* are sometimes called *scale insects*, and by the French *gallinsectes* (Latinized by some entomologists into *gallinsecta*), but they are not to be confounded with the insects called gall-flies (*cynipidæ* or *gallicolæ*), which produce *galls* or nut-galls. The *coccidæ* are very numerous, and are attached to particular plants, on the juices of which they feed, often producing much mischief by the flow and loss of sap which their punctures occasion, and giving great trouble to gardeners, who find it very difficult to free their plants, particularly in hot-houses, from the *scale*, the *mealy bug*, the *vine-gall*, etc. Various washes, consisting of soap, sulphur, tobacco, etc., are employed for this purpose; but moist heat, or as much exposure to steam as the plant can bear, has been found in many cases the most efficacious remedy. The destructive coffee-bug belongs to this family. The male *coccidæ* are winged insects, having only two wings, which shut horizontally upon the body; the abdomen is terminated by two threads. The females are wingless. It is not well known how the males subsist, as they have no apparent organs for sucking juices or eating any sort of food. The females have a beak, which they insert into plants in order to suck their juices. This interesting family of insects contains not only many troublesome species, but some which are of great value, particularly for the beautiful dyes which they yield. These dyes are obtained from the bodies of the female insects. Among them are cochineal (q.v.) and kermes (q.v.). A species of C. (*C. Polonicus*), which lives on the roots of the knawel (*scleranthus perennis*), yields the SCARLET GRAINS OF POLAND, a considerable article of commerce before cochineal was introduced into Europe; and a species which feeds on the roots of the burnet (*poterium sanguisorba*), was in like manner used by the Moors for dyeing silk and wool of a rose color. Other species produce lac (q.v.) and wax. See WAX INSECT.

COCCY'ZUS. See CUCKOO.

COCHABAM'BA, a name of various application in Bolivia.—1. A river which forms one of the head-waters of the Amazon.—2. A city on the foregoing river, lying 145 m. to the n.n.w. of Chuquisaca, the chief city of the Bolivian republic, and containing about 45,000 inhabitants. It has a temperate and healthy climate, and is engaged in the manufacture of cotton fabrics and glass wares.—3. A department, of which the city just described is the capital, in lat. 17° to 19° s., long. 65° to 68° west. With an area of 26,000 sq.m., it has a pop. of about 380,000. In addition to the precious metals, it yields cotton, sugar, dyewoods, and timber.

COCHIMI, a tribe or race of Indians in the peninsula of lower California, still in the lowest stages of savage life. They say their ancestors were driven southward by other Indian nations after a general war. The Jesuits established missions among them early in the 18th c., but the missions were suspended after the expulsion of the order.

CO'CHIN, a protected state of Hindustan under the presidency of Madras, lat. 9° 48′ to 10° 50′ n., long. 76° 5′ to 76° 58′ east. With Malabar on its n.w. and n., and Travancore on its e. and s., it fronts the Arabian sea on the s.w., and meets Coimbatore towards the n.e. on the water-shed of the western Ghauts. It contains 1361 sq.m., and 598,353 inhabitants. Its hydrography is singular. The western Ghauts, which have here an elevation of fully 4,000 ft., intercept the s.w. monsoon, and render the coast one of the most humid regions in the world during June, July, August, and Sept.; while even during the remaining eight months, anything like an unremitting drought is unknown. As the space between the mountains and the sea is almost on a level with the tide, the countless streams have each two contrasted sections—the plunging torrent that breaks into comparatively short pieces the magnificent trunks of teak with which it is freighted; and the sluggish brook which, however it may vary, according to the season, in breadth and depth, pretty uniformly results in a brackish estuary. Further, these estuaries, almost continuously breasted by a narrow belt of higher ground, form between them a backwater or lagoon of 120 m. in length, and of every width between a few hundred yards and 10 m., which communicates at only three points with the ocean. The cocoa-nut is the most valuable product of the country; besides this tree, however, the forests produce red cedar, anjelly teak, benteak, and many other hard woods, but these are now becoming very scarce. The low country produces rice, pepper, cardamoms, ginger, betel-nut, yams, arrow-root, and sweet potatoes. The population is peculiar in its composition, more especially as compared with that of the more easterly parts of the peninsula. The great mass of the population are Hindus, but there are also Mohammedans, and a large number of Christians and Jews. The Jews are classified into white and black; and the Christians, divided between the Syrian and Romish churches, trace their origin partly to the Portuguese conquest, and partly to the missionary labors of St. Thomas the apostle. Both the places of worship and the seminaries of education throw light on the relative numbers of the different parties. The latter, 95 in all, are—English, 5; Malayalam, 69; Tamul, 9; Mahratta, 1; Sanscrit, 7; and Hebrew, 4. The former are—Hindu, 2,734; Mohammedan, 31; Jewish, 8; and Christian, 108.

COCHIN, once the capital of the principality above described, but now a seaport of the district of Malabar, in the presidency of Madras, stands in lat. 9° 58′ n., and long. 76° 18′ e., on the s. side of the principal channel, between the open ocean and the backwater mentioned in the preceding article. As this lake, so to speak, is, even in its lowest state, always navigable for canoes, its value, as a means of communicating with the interior, can hardly be overrated in a country where roads and bridges are nearly out of the question. The harbor affords a depth of fully 25 ft.; but there is a bar in front, which, according to the latest survey, has only between 17 and 18 ft. of water upon it. On this bar, during the s.w. monsoon, the surf breaks so violently, that it is sometimes, but not often, impassable for vessels. Still C. is next to Bombay on this coast with respect to ship-building and maritime commerce. Here the Portuguese erected their first fort in India in 1503. They were supplanted by the Dutch in 1663—the epoch also of the transfer of Bombay to Charles II. In 1796, C. was captured by the British, and about ten years after, its fortifications and public buildings were destroyed, and its private dwellings very much damaged. Notwithstanding this check, the place continued to flourish; many merchant vessels, ranging upwards to 1000 tons, have been built; and, besides ships of war for the local navy, 3 frigates have been launched for the imperial service. The population of the city, numbering about 20,000, is more heterogeneous than even that of the state of the same name, the additional elements being Dutch, Armenian, Arabian, and Persian. Its trade depends almost entirely on the produce of the cocoa-tree—viz., oil and cocoa fiber. Water is brought from a distance of 18 m. The average temperature is 78° Fahrenheit.

CO'CHIN CHI'NA, or ANAM', an empire of Asia, occupying the greater part of the eastern portion of the Indo-Chinese peninsula. It lies in 10° to 23° n. lat., and 102° to 109° e. long., including Tonquin and C. C. proper. It is bounded, n. by China, e. by the gulf of Tonquin and the China sea, s. by lower or French C. C., and w. by Laos, Siam, and Cambodia. Area, 200,000 sq. miles.

Physical Features.—A mountain range of considerable height runs through the country, parallel with the coast. The northern province of Tonquin is an extensive plain, through which flows the river Song-ca. C. C. proper extends along the coast between 11° and 18° n. latitude. The largest river of Anam, and indeed of the whole Indo-Chinese peninsula, is the Ma-kiang or Cambodia, which, rising in the mountains of China, flows through Laos and Cambodia, and, after a course of some 1500 m., separates into several branches, and finally discharges itself into the China sea. The Song-ca, or Great river, of Tonquin, has an estimated course of 400 miles. The Hué, in C. C. proper, flows through a fertile valley, and presents some of the finest scenery in Asia.

As to *climate* in Tonquin, the changes of temperature and weather are very sudden. Much rain falls in C. C. during the whole summer, which produces a general inundation about the end of October. Sept., Oct., and Nov. are the best months of the year, and most suited to the European constitution.

Among the *agricultural productions*, rice, of which two crops are raised in the year, holds the chief place. Potatoes, pease, beans, melons, and other vegetables, maize, tobacco, cotton, indigo, tea, and sugar, are also grown. Silk is produced in considerable quantities. Valuable trees, such as the calumba, ki-nam or scented eagle-wood, ebony, rose-wood, iron-wood, sandal-wood, the varnish-tree, and many others, flourish on the mountains. The palm tribe and the bamboo are common in the low lands. The *mineral* riches of the country are very much neglected; but gold, silver, iron, copper, and coal exist, and are most abundant in Tonquin. The *domestic* animals are the elephant, Indian cow, buffaloes, pigs, goats, dogs, and cats. Fowls of that kind so lately a rage in this country, ducks, geese, and pigeons, abound in every village. The most dreaded of the *wild animals* of C. C. is the tiger. Elephants are very numerous in the forests of Tonquin; and leopards, wolves, bears, wild boars, the rhinoceros, as well as many kinds of apes and monkeys, infest the mountainous districts. Serpents and other reptiles are to be met with in great numbers. Of *birds*, eagles, peacocks, quails, partridges, paroquets, and wild ducks are amongst the most important. Fish of very excellent quality swarm in the rivers and canals. Very many are taken on the sea coast, and carried to every part of the country.

Inhabitants.—The Cochin Chinese, like the other peoples of the Indo-Chinese peninsula, are characterized by a Mongolian physiognomy and a monosyllabic language. They are rather low in stature, but well proportioned, hardy, and active. The women have a lighter skin, and are altogether better looking than the men. Their dress is the old national costume of the Chinese prior to the Tartar conquest. The Cochin Chinese are greatly addicted to smoking, and betel-nut is the universal masticatory. The civilization of this people has been derived from China; hence their religion and government, manners and customs, nearly approximate to the creeds, administrative system, and habits of that country. The selection of a place of sepulture is with them a very grave consideration, and the good or bad fortune of a family is supposed to depend upon it. Rice, with a sauce called balachiam, made of macerated salt fish, is the principal food of the Cochin Chinese; but they are very unclean feeders, no flying or creeping thing, whether bat, insect, or reptile, coming amiss. The national drink is tea, but a liquor made from rice is also in use. The common dwellings, which are raised 2 or 3 ft. from the ground, are made of bamboo and thatch; but the better classes inhabit brick houses roofed with tiles. Women in C. C. are allowed full liberty, and frequently engage in commerce and agriculture. They are kind to their children and proud of a numerous offspring. Infanticide is unknown, but the poor sometimes sell the children they cannot afford to keep. Marriages are regulated by law; and before they can be contracted, the consent of the head of the family is required. Polygamy, or rather a system of concubinage, is allowed, but obtains chiefly among the rich. Divorce is also permitted. The laws against adultery are very severe, yet amongst single women little or no disgrace attends a breach of chastity. The law invests the creditor with the most arbitrary power over the property, wives, and family of his debtor. The pop. is estimated at 21,000,000.

Government and Administration.—These are after the Chinese model. The emperor is absolute, but he must govern according to the laws. He is assisted by a supreme council of high mandarins, seven of whom are his ministers. The government officials are divided into military and civil or literary mandarins. The former have the precedency; and from them the emperor selects his ambassadors, governor-generals, and viceroys. The learned and official language of the country is Chinese. For *administrative purposes*, the country is divided into provinces, departments, districts, and villages. A military governor or viceroy, and two high civil mandarins, reside at every provincial capital; and the minor divisions have each their regular number of officials, who are appointed by the supreme government. The laws are very arbitrary. The bastinado system is in full force; indeed, the bamboo may be regarded as a political and social institution. The mandarins, as a class, are described as very corrupt. The capital of the whole empire is Hué, or Huah. The foreign *commerce* of C.C. is carried on chiefly with China, the Portuguese settlement of Macao, Bankok, and Singapore. Cochin Chinese junks annually visit that port and the British straits' settlements.

History.—Previous to the Mongol invasion of China, Tonquin formed a part of that empire, but at that time it threw off its allegiance. The Anamitic sovereign now,

indeed, acknowledges the emperor of China as his superior, yet his vassalage is little more than nominal. The present inhabitants of C. C. proper are said to be descendants of political refugees from Tonquin. In 1774, a revolution in the former country deprived the reigning monarch, Ghialong, of his throne, but in 1790, assisted by some European adventurers, he not only re-established his power in C. C., but added Tonquin to his dominions. By a treaty in 1874, France guaranteed the independence of C., and obtained the opening of three ports to European commerce.—See Veuillot's *La Cochinchine* (1859); Bouillevaux's *L' Annam* (1875).

COCHIN CHINA, LOWER or FRENCH, a colonial possession of France in the southern extremity of the eastern portion of the Indo-Chinese peninsula. Lat. 9° 5′ to 10° n.; long. 105° to 107° east. This territory was acquired after a war provoked by the continuous persecutions for many years of the Christians in his dominions by the king of Anam, and especially by the murder of several French and Spanish missionaries. After an invasion, the three provinces of Saigon, Bienhoa, and Mytho, together with the island of Pulo Condor, and a few others which lie off the coast, were taken possession of in 1861. In 1867, a new treaty, formed after the repression of formidable hostile aggessions on the part of some of the natives, led to the annexation of other three provinces —Vinhlong, Chandor, and Haytien—thus completing the present colony of *Cochinchine française*. Area, 21,600 sq.m.; pop. '73, 1,526,867.

Napoleon III., in urging on the vigorous war policy which led to this acquisition, had in view the tradition that France had earlier claims to be satisfied, and other wrongs to be redressed, than those which induced him and the Spanish government to resolve on putting an end to the oriental monarch's persecuting cruelty. In 1787, Ghialong, king of Anam, in want of assistance to secure his throne, entered into a treaty with Louis XIV., by which he engaged, in return for French aid, to cede the town and harbor of Touran (Kwang-han), with its territory and two adjacent islands. The little active assistance afforded by France was effective; Ghialong was established on the throne, and added Tonquin and Cambodia to his dominions. The promises made to France were not fulfilled, but her missionaries were protected. Of the three kings, however, who successively mounted the throne after the death of Ghialong, each excelled his predecessor in persecuting the Christians, whether European or natives, and in murdering the missionaries. Tuduk, who began to reign in 1847, issued an order the same year that all missionaries should be drowned; and another in 1851, that whoever concealed a missionary should be cut in two and thrown into the river. From the time of this latter decree, the blood of his victims never ceased to flow till the sanguinary struggles which led to the establishment of the colony of lower C. C. frightened the blood-thirsty religionist into toleration. Cambodia, a level country fertilized by the Makiang, the climate of whose plains has been compared to that of Bengal, and formerly a sort of feudal dependency on Siam, has been declared independent under the protectorate of France. In June, 1864, the ruler of this country, formerly only a viceroy, was crowned in the presence of Siamese and French representatives at his capital, Houdon, assuming the name of Phra Norodon. He has accorded to France the right of forming a settlement on the Makiang or Cambodia river, at the point where its four arms unite before descending to the China sea.

Great exertions have been made by France to promote the prosperity of this colony, and to use its territorial influence in such a way as to acquire the good-will of the natives. National municipalities have been preserved; the land-tax has been lowered; and the proportion of men demanded for military service has been greatly lessened from what it was under the native princes. In 1866, a decree was issued to regulate civil marriages. Ardent hopes for the spread of Christianity are indulged in, on the ground that the natives are peculiarly open to its influences; and there has been talk of making Saigon a free port, to compete with Singapore. But that the colony pays its own expenses has not been made clear; and the French do acknowledge that their new subjects are neither industrious nor commercial. Although the resources of the country are but imperfectly developed, rice is produced in considerable abundance; cotton, sugar, indigo, and tobacco are also cultivated. The dwarf mulberry grows freely; silk-worms are reared with facility; hemp, the betel-nut, and the areca-nut are likewise grown.

COCHINEAL, a dye-stuff employed in dyeing scarlet and crimson, and in the preparation of carmine (q.v.) and lake (q.v.).

C. consists simply of the bodies of the females of a species of *coccus* (q.v.), called *C. cacti*, because it feeds upon plants of the *cactus* family, particularly on one, therefore designated the C. plant, but known in Mexico as the NOPAL (*opuntia cochinillifera*), treated of in the article CACTEÆ. This plant is nearly allied to the prickly pear. It assumes a somewhat tree-like form. Its fruit, although eatable, is very inferior to that of the prickly pear. It is a native of Mexico and other warm parts of America, and is assiduously cultivated, in order to what may be called the cultivation of the valuable insect which it supports. This cultivation was carried on by the Mexicans long before the country was known to Europeans. It is now carried on also in some parts of the West Indies, and in the island of Teneriffe. The C. plant and insect have been introduced into Algeria; but no considerable success has yet attended the attempts to introduce them into the East

Indies, although the East India company once offered a reward of £6,000 for their introduction.—Other species of *opuntia* appear to be as suitable for the C. insect as *O. cochinillifera*, particularly *O. Hernandezii*, which is employed in Mexico, and *O. tuna*, which is chiefly used in Peru.

The C. insect is a small creature, a pound of C. being calculated to contain 70,000 in a dried state. The male is of a deep red color, and has white wings. The female, which is wingless, is of a deep brown color, covered with a white powder; flat beneath, convex above. When a plantation of the C. plant has been formed—by cuttings which are ready to receive the insect in eighteen months—the cultivator (*nopalero*) procures branches laden with C. insects; and keeping the branches, of which their succulency admits, till the mother-insects have laid their eggs, he places their bodies, with the eggs which they cover, in little nests formed of some cottony substance upon the C. plants, and the young insects, when hatched, soon spread over them. The gathering of the C. is very tedious, and is accomplished by brushing the branches with the tail of a squirrel or other animal. The insects are killed by boiling water, by heating them in ovens, or by exposure to the heat of the sun. They must be speedily killed, to prevent them from laying their eggs, which diminishes their value. When killed and dried, they may be kept for any length of time without injury. The different appearances presented by C. as brought to market, are ascribed to the different modes of killing the insect. C. is one of the most important exports of Mexico.

COCHIT'UATE LAKE, in Middlesex co., Mass., 17 m. s. of Boston, covering a little more than 1 sq.m., whence Boston draws its supply of water.

COCH'LËA. See EAR.

COCHLËA'RIA. See SCURVY-GRASS.

COCHRANE, JOHN DUNDAS, 1780–1825; an English sailor and traveler. In 1820, he laid before the admiralty a plan for exploring the river Niger, but it was rejected. In Feb., 1820, he started from London on a journey around the world, to be performed as far as possible on foot. After much suffering he made his way through Russia and Siberia to Petropaulowski, in Kamtchatka. There he married the daughter of a sexton, and abandoned the idea of crossing North America. Returning to London by the same route over which he had passed, he published a *Narrative of a Pedestrian Journey through Russian and Siberian Tartary from the Frontier of China to the Frozen Sea and Kamtchatka.* He died while making a tour in South America.

COCK, properly, the name of the male of the common domestic fowl (see FOWL), but very generally extended to the males of other kinds of gallinaceous birds, and not unfrequently employed as a distinctive appellation of the males even of some kinds of small birds.

The ancients regarded the domestic C. as the companion of Mars, and in heraldry he is the emblem of strife, of haughtiness, of quarrels, and of victory. Guillim has the following quaint eulogium on the cock: "As some account the eagle the queen, and the swallow or wagtail the lady, so may I term this the knight among birds, being both of noble courage, and also prepared evermore to the battle, having his comb for a helmet, his sharp and crooked bill for a falchion to slash and wound his enemy; and as a complete soldier armed cap-à-pie, he has his legs armed with spurs, giving example to the valiant soldier to expel danger by fight, and not by flight. The cock croweth when he is victor, and giveth a testimony of his conquest. If he is vanquished, he shunneth the light and society of men!" The C. is said to have been the emblem of the ancient Gauls, who wore it on their helmets for a crest; and though the tradition does not rest on the authority of any medal or other monument, and is supposed to have been a mere play of words between gallus, a cock, and Gallus, a Gaul, the C. was placed, after the revolution, on the flags and ensigns of France.

As the emblem of watchfulness, the image of the C. was placed on the summits of church-steeples from a very early period. It is introduced by artists amongst the emblems of our Lord's passion, in allusion to St. Peter's sin, and for the same reason it is St. Peter's own emblem.

COCK DIVINATION, or ALECTROMANCY, is a method of divining in which a young white cock was made the principal actor. The plan pursued was to describe a circle, and divide it into as many equal parts as there are letters in the alphabet. Upon each of the spaces marked by its respective letter, a grain of corn was placed; and the letters from which the fowl picked the grains, when put together, formed the name of the person about whom inquiry was made.

COCKADE (Fr. *cocarde*, or *coquarde*). According to Wedgwood, the word signified originally a cocked-hat, or a hat with the broad flap looped up on one side, and was then applied to the knot of ribbon with which the loop was ornamented. Another view is, that it is derived from *coquart*, a beau, one fond of gay trappings. The word is now, however, restricted to signify an appendage to the head-dress worn as a military or naval distinction.

Badges of distinction were early had recourse to in party and civil warfare. A sprig of broom (*planta genista*) was the badge of the house of Plantagenet. In England, dur-

ing the wars between the houses of York and Lancaster, the adherents of the former party were distinguished by a white and the latter by a red rose worn in the cap.

The party organized at the court of Charles IX. of France to perpetrate the massacre of St. Bartholomew, recognized one another by a paper cross. The faction of the *fronde*, opposed to cardinal Mazarin, wore stalks of corn for the same purpose; and certain military bands were called *lances vertes*, from decorating their lances with green twigs. The use of cockades, as marks of distinction in campaigns and battles, become very general about the beginning of the 18th century. Eugene and Marlborough gave the Germans, English, and Dutch, composing their army, a tuft of corn or grass as their signal or cockade. The use of the C. began to be more fixed in the war of succession. White being the color of France, and red of Spain, the two colors were united in the C. of the combined army. At last, in 1767, an authoritative regulation determined that every French soldier should wear a C. of white stuff; and in 1782, cockades were prohibited to all but soldiers. From this time till the revolution, the C. was an exclusively military badge; and, both in France and England, "to mount the C." was synonymous with becoming a soldier. But in the enthusiasm of 1789, the citizens of France generally assumed the tricolored ribbon as the badge of nationality and patriotism, which was soon also given to the army. The three colors were blue, white, and red: white had long been the color of France and its kings; the blue is understood to have come from the banner of St. Martin, and the red from the oriflamme (q.v.). Long before the revolution, the three colors were used in combination: they were given by Henry IV. to the Dutch, when they desired him to confer on them the national colors of his country, and have ever since been borne by the Dutch republic and kingdom of the Netherlands. At the restoration, the white C. of the monarchy again took its place, but had to give way once more to the tricolor, which continues to be the C. of the French army.

Black, with some distinction, enters into the cockades of the German nations. The Austrian is black and yellow; and the Prussian was black and white, abandoned for the black, yellow, and white of the German empire. After the German war of liberation in 1813, a national C. of black, red, and gold came into general use, and was afterwards assumed by the military and by officials. The wearing of these German cockades was prohibited in 1832, by a resolution of the German diet; but in 1848, they were again introduced, not only by patriots as a badge of German union, but into the armies. The national colors of Belgium are black, yellow, and red. Cockades of these colors were worn by almost the whole population of Brussels on occasion of the constitutional festival, July 21, 1860. Cockades of green, white, and red are worn in Italy.

The continental C. is generally in the shape of a flat disk, sometimes of metal, sometimes of silk or other stuff, with the colors disposed concentrically.

In England, the badge of the Stuarts was a white rose; and after the expulsion of the family, the white C. became the distinctive mark of the adherents of the exiled family, in opposition to the orange of Nassau and the black of Hanover; it is a favorite theme in Jacobite songs. The black C., to be seen on the hats of many gentlemen's servants, was unknown in Britain till the accession of the house of Hanover, and was then introduced by George I. from his German dominions. It seems to be understood that the right to use it belongs to naval and military officers, and the holders of some offices of dignity under the crown, including privy councilors, officers of state, supreme judges, etc. It is difficult to know where the line should be drawn, as the privilege is one of which the law takes no cognizance. It is often maintained that the distinction belongs to deputy-lieutenants, but it can hardly be supposed to extend to officers of volunteers.

COCKATOO', *Plyctolophus*, a genus of birds of the parrot family, or *psittacidæ*, distinguished from parrots by the greater height of the bill, and its being curved from the base, and by the lengthened, broad, and rounded tail. The head is also large, and in the true cockatoos is surmounted by a crest of long and pointed feathers, with their tips directed forwards, which can be erected and expanded like a fan or depressed at the pleasure of the bird. The true cockatoos are also all of generally whitish plumage, but often finely tinged with red, orange, and other colors, or mixed with these colors in more brilliant display. But the name C. is also commonly extended to nearly allied genera, as *calyptorhynchus* and *microglossus*, in both of which the plumage is generally dark, and to which belong the *black cockatoos* of Australia and of the Indian archipelago. The genus *microglossus*, to which belongs the great black C., or giant C. of New Guinea, is remarkable for the structure of the tongue, which is cylindrical, tubular, capable of being greatly protruded from the mouth, and terminates in a cloven horny tip. All the cockatoos are natives of the regions already named. They abound in Australia. They live not only on fruits and seeds, but partly on insect larvæ. Some of them are frequently to be seen in confinement in Europe, particularly the lesser sulphur-crested C. (*plyctolophus sulphureus*), which, although of comparatively tame plumage, is a general favorite on account of its docility. None of the cockatoos learn to speak many words. Their name is derived from their own proper cry.

COCK'ATRICE, one of the fabulous monsters, a belief in the existence of which prevailed among the ancients and during the middle ages. It was sometimes distinguished from, and sometimes identified with, the basilisk. It was also regarded as possessing

similar deadly powers. Its monstrous generation has already been noticed in the article BASILISK. For protection against it, travelers in Africa are said to have carried with them its relative, the cock, the crowing of which caused it instantly to expire. The word C. is sometimes used in the English version of the Old Testament. Perhaps all that can safely be affirmed of the meaning of the original Hebrew, is that it is the name of a venomous serpent. In heraldry, the C. is an imaginary monster, with the wings of a fowl and the tail of a serpent.

COCKBURN, Sir ALEXANDER JAMES EDMUND, 1802–1880 ; son of Alexander Cockburn who was English minister in Colombia. He was educated at Cambridge, and called to the bar in 1829. In 1841, he was made a queen's counsel, and in 1847 was elected to parliamennt from Southampton, where he distinguished himself (1850) by defending Palmerston's foreign policy. He was soon afterwards appointed solicitor-general, and in 1851, promoted to attorney-general. In 1854, he was made recorder of Bristol; in 1856 appointed justice of the common pleas, and in 1859 he became lord chief justice of England. In 1871, he was made English arbitrator for the settlement of the Alabama claims. He differed with his colleagues at Geneva, refusing to sign the award. In 1878, he was chairman of the Cambridge university commission.

COCKBURN, ALISON, (Mrs.), 1712–94; author of one of the most delightful Scotch ballads, known as *The Flowers of the Forest.* She was the daughter of a border laird, and had little education, and was fond of rambling around the country. The song is generally believed to have been written after the departure for London of one John Aikman, an early lover. In 1731, she was married to Patrick Cockburn, of Ormiston, an advocate. She subsequently became acquainted with all the celebrities of the day. She was one of the belles of Edinburgh, a graceful dancer, an indefatigable letter-writer and composer of parodies, squibs, toasts, and character sketches. She was a relative of Walter Scott's mother.

COCKBURN, CATHERINE, 1679-1749; an English authoress, wife of a non-juring clergyman who finally conformed and received a living in Cumberland. She wrote *A Defense of Locke's Essay on the Understanding,* besides plays, poems, and essays.

COCKBURN, Sir GEORGE, 1772–1853; an English naval officer whose operations against Martinique secured that island to Great Britain. He was active in the war with the United States in 1812–15, marauding along the shores of the Chesapeake and burning the public buildings at Washington. His last noteworthy sea employment was to convey Napoleon to St. Helena. He rose to the rank of admiral, was several times returned to the house of commons, and was one of the lords of the admiralty.

COCKBURN, HENRY, a Scottish advocate and judge, was b. at Edinburgh on Oct. 26, 1779. At the age of eight, C. began attendance at the high school of Edinburgh, but exhibited no indications of extraordinary abilities. Sent to the university of Edinburgh at the age of fourteen, his powers began to develop themselves; and though never distinguished as a student, he became the companion of men like Brougham, Horner, and Jeffrey, from whom he imbibed liberal opinions, greatly to the annoyance of the hereditary toryism of his family. He was called to the Scottish bar in 1800, and after seven years spent in becoming patience, according to the manner of his profession, he was appointed, by his relative, Lorde Melville, one of the advocates whose duty it is to assist the lord advocate in the prosecution of criminal offenders. Though the appointment was conventionally a political one, and though the party to whom C. was opposed was then in power, he was persuaded to hold the office, as it had in itself really nothing of a political character, upon the understanding that his own views were not to be compromised. It was expected, however, that he would give up his liberalism; and when this expectation was disappointed, advantage was taken, about four years after, of some trivial excuse to dismiss Cockburn. Not till the introduction of jury trial in civil causes into Scotland in 1816, did C. find opportunity for remunerative professional employment. His powers were better adapted for success with a popular, than with a professional tribunal. Extremely simple, clear, and impressive, at times humorous, at times pathetic, always unaffected, and, when he pleased, eloquent, he urged his side of the question with so much earnestness and candor, that the effect was almost irresistible. Under the Grey ministry of 1830, he was appointed solicitor-general for Scotland; and four years later, he was made one of the judges of the Scottish supreme civil and criminal courts, and took, according to the Scottish custom, the title of lord Cockburn. He died 26th April, 1854, at his residence of Bonaly, in the neighborhood of Edinburgh.

The efforts of C. as an author were not numerous. He contributed to the *Edinburgh Review* a few articles, having, it would seem, chiefly a temporary interest. Those upon Scottish law reform are known to have had considerable influence in producing the changes desired. Late in life, he undertook, at the request of Jeffrey's executors, the life of his beloved friend. This work was published in 1852. C. will be best remembered by the *Memorials of his Time,* which appeared posthumously in 1856. It is a kind of autobiography, into which have been interwoven numerous anecdotes illustrating old Scottish life, and numerous sketches of the men who composed the brilliant circle of Edinburgh society at the beginning of the present century. A portion of the MS. kept

back until a date further removed from the times of which it treats, appeared in 1874, entitled *Journal of Henry Cockburn*.

COCK'CHAFER, *Melolontha vulgaris*, a beetle of the family *lamellicornes* (q.v.), and section *phyllophagi* (leaf-eaters), very common in England and most parts of Europe, comparatively rare in Scotland, famous for the ravages which it commits, both in the grub state and in that of a perfect insect—the winged beetle feeding on the leaves of fruit-trees, and of many forest-trees, as the sycamore, lime, beech, and willow; the grub devouring the roots of plants, particularly of pasture-grasses and corn. The C. is fully an inch in length, of a pitchy black color, with a whitish down, giving a sort of powdered appearance; the sides of the abdomen marked by a range of triangular spots; the abdomen terminating in a point; the antennæ short, terminating in a club formed of six or seven leaflets: the grub is about an inch and a half long, thick, whitish, with a red head and six legs. The C. does not live long after it has passed into its perfect state, but it lives nearly four years in the grub or larva state. The female C. deposits her eggs in the earth. The ravages of cockchafers were so great in some of the provinces of France in 1785, that the government offered a premium for the best mode of destroying them. The whole grass of a field has often been destroyed in a short time by their grubs, and the beetles themselves strip off the foliage of trees like locusts. They have sometimes appeared in prodigious numbers in some places in England: the river Severn is said to have been so filled with their bodies in 1574, that the water-wheels of the mills were clogged; and in 1688, they so abounded in the county of Galway, in Ireland, that they hung in clusters on the trees and hedges like bees swarming; the noise of their countless jaws at work was heard by every traveler, and was compared to that of the sawing of timber. Rooks and other birds render great service by preventing the excessive multiplication of cockchafers. In Scotland they are called *clocks*.

COCKE, a co. in e. Tennessee, bordering on North Carolina, traversed by the Cincinnati, Cumberland Gap and Charleston railroad, and watered by French Broad and Big Pigeon rivers; 270 sq.m.; pop. '80, 14,808—1420 colored. Surface mountainous and well wooded; productions, agricultural. Co. seat, Newport.

COCK'ER, a small kind of spaniel, very similar to the Blenheim dog, often black. The habits and disposition are similar to those of the spaniel. The small size of the C. fits it for ranging in low and thick coverts, and it is accordingly much employed by sportsmen in pheasant and woodcock shooting; but it must not be allowed to range to any considerable distance, as it cannot be trained to wait for the sportsman, but starts the game.

COCK'ER, EDWARD, widely celebrated on account of his *Arithmetic*, which has served as the model of almost all school-treatises subsequent to its publication, was born, it is supposed, in London about the year 1631 or 1632; and died between the years 1671 and 1675. The first edition of his famous *Arithmetic* (which was the first to confine itself to commercial questions only) was published, after his death, in 1677, by John Hawkins, who came into possession of C.'s MSS. C. was author of some other works, but his fame rests entirely on the one mentioned. The expression, "according to Cocker," became common through its frequent use on the title-pages of arithmetical treatises following his method.

COCKERELL, CHARLES ROBERT, 1788-1863; an English architect who visited Greece, Italy, and Asia Minor to study ancient architectural remains, making excavations at Ægina and other places, and enriching the British museum with many rare and valuable fragments. He became a member of the royal academy, and a professor of architecture, his lectures on which were highly esteemed. He was the designer of many public buildings in London, Cambridge, Liverpool, and other places, and was the author of several works on his favorite theme.

COCKERILL, JOHN, 1790-1840; an English engineer, who established at Seraing one of the largest machine-shops in Europe, half of it being owned by the king of Holland. He often had 2,000 men employed at one time. In 1839, he failed.

COCK'ERMOUTH, a parliamentary borough in the w. of Cumberland, at the confluence of the Cocker and Derwent, 25 m. s.w. of Carlisle. It is delightfully situated in an agricultural district, and has a promenade a mile long along the Derwent. The ruins of a castle, founded in the end of the 11th c., stand on a bold height on the left bank of the Cocker, near its junction with the Derwent. The castle was besieged for a month by the royalists in 1648, and afterwards reduced to ruins by the parliamentarians. Near C. is a tumulus, with a Roman camp and ditch 750 ft. in circuit. Many ancient relics have been found near Cockermouth. There are manufactures of linens, woolens, cottons, hats, hosiery, and paper, and in the vicinity, extensive coal-mines. Wordsworth the poet was born here. Pop. '71, 6,936. C. returns one member to parliament.

COCK-FIGHTING is said to have originated with the Athenians. In the earlier part of our history; since the conquest, we find little mention of it; but it is evident that it existed in the days of Thomas-à-Becket, and until the time of the commonwealth it flourished, the pit at Whitehall having been erected and patronized by royalty. It was prohibited in 1654; and although there have been other acts passed with the view of putting it down, it still exists under prohibition.

The greatest point considered in choosing cocks, is the breed. Formerly, there were established favorites, and very large sums were given for their chicks. Much art is said to be displayed in the training of cocks, and in trimming and preparing the cock for the combat; the fastening on of the spurs is a matter of considerable experience. Young cocks are called stags; two years is the best age. In fighting a match a certain number of cocks to be shown on either side is agreed upon, and the day before the match, the cocks are shown, weighed to the greatest nicety, and matched according to their weights. Their marks are all also carefully set down, to prevent trickery. The cocks within an ounce of each other in weight are said to "*fall in*" and are matched Those which do not fall in, are matched to fight what are called "*byes.*" Those which do fall in, come into the *main.* The main is fought for a stake upon each battle, and so much for the main, or the winner of the most battles in the main; while the byes have nothing to do with the main, and are usually fought for smaller sums. Should the numbers be equal, so that the main cannot be decided, it is usual to separate two or more cocks which are matched to fight, and are of equal or a dead-weight, and to give or take an ounce either way with one of each of the birds which would fall into the byes, so as to make an uneven number.

A middling size is considered the best, and from 3 lbs. 6 oz. to 4 lbs. 8 oz. is the medium. Cocks sometimes fight in silver spurs, but more often in steel. The laws of fighting are very precise and particular.

To lend to brutes the means of destroying each other, and of rendering their conflicts more deadly than nature ever intended them to be, cannot be considered a spectacle calculated either to refine or to improve humanity; while the indulging in it as a sport, as it is practiced even in its lightest and least objectionable form, is simply cruelty. But the practices of placing a bird, that has perhaps been crippled in combat, down, without even his natural weapons, before a young stag armed, in order that the stag may be taught the art of killing, and the Welsh main, where the cocks fight until only one is left alive, are too disgustingly cruel to be thought of without indignation.

Cock-fighting is prohibited by 12 and 13 Vict. c. 92. A penalty of £5 may be levied on any person keeping fighting-cocks, letting a cock-pit, or otherwise connecting himself with cock-fighting, for every day that he shall so act.

COCK LANE GHOST. In the year 1762, London was thrown into a state of extraordinary excitement by the reported existence of a ghost in the house of a Mr. Parsons, in Cock lane, Smithfield. Strange and unaccountable noises were heard in the house, and a luminous lady, bearing a strong resemblance to one who, under the name of Mrs. Kemt, had once resided in the house, but who had died two years before, was said to have been seen. Dark suspicions as to Mr. Kemt having poisoned the lady were immediately aroused, and were confirmed by the ghost, who, on being interrogated, answered, after the fashion of the spirits of our own day, by knocking. Crowds, including Dr. Johnson, were attracted to the house to hear the ghost, and the great majority became believers. At length a plan was formed by a few skeptics to ascertain the real origin of the noises. The girl from whom the sounds were supposed to proceed, was taken to another house by herself, and threatened with the imprisonment of her father in Newgate if she did not renew the rappings that evening, the noises having for some time been discontinued. She was observed to take a board with her into bed, and when the noises took place, no doubt was entertained that they had all along been produced by similar methods. A prosecution was then raised by Mr. Kemt, and Parsons was condemned to stand thrice on the pillory for imposture and defamation.

COCK'LE, *Agrostemma,* a genus of plants of the natural order *caryophyllœ,* in which the flower has ten stamens and five styles; the five teeth of the leathery naked calyx are much longer than the tube of the corolla, and the capsule is perfectly 1-celled. The common C., or corn C. (*A. githago*), is a frequent weed amongst crops of grain, a native of Europe or the w. of Asia, but now to be found in almost all parts of the world. It is an annual plant, clothed with very long hair; with large, solitary, terminal lilac flowers. The root, stem, leaves, and seed were formerly used in medicine; the seed is still sometimes sold in Germany under the name of black cumin (schwartz-kümmel). The corn C. is a very troublesome weed in some parts of Britain, and is rare and almost unknown in others.

COCKLE, *Cardium,* a genus of lamellibranchiate mollusks, having a shell of two equal ventricose valves, more or less of a heart-shaped appearance. The animal has two *adductor* muscles for drawing the valves closely together; its foot is remarkably large, and bent in the middle, and is capable of being suddenly straightened, so that the animal may move by a jump. More commonly, however, the foot is employed for excavating a hole in the sand or mud, in which the C. burrows; and when used for this purpose, it is distended by being filled with water. Cockles are usually gregarious, and vast numbers are found on sandy and muddy banks. The common C. (*C. edule*) is very abundant on the sandy parts of the British shores, and is one of our most valuable shell-fish, affording much palatable and nutritious human food. The number of known species is about 200; they are most numerous within the tropics, and particularly in the Indian ocean.—The genus *cardium* is made the type of a family *cardiadæ,* and of an order *cardiaceæ,* which includes *veneridæ, mactridæ, tellinidæ,* and other families.

COCKNEY. This word is connected with *cocker* (Dutch, *kokeln*, to pamper; Fr. *coqueliner*, to dandle), which, according to Wedgwood, means primarily to rock the cradle, and hence to cherish, pamper. C. thus meant originally a child delicately nurtured, and was hence applied to the citizens of luxurious towns, as opposed to the hardier inhabitants of the country. The French *pays de cocagne*, and similar expressions among other nations, denote a utopia—an imaginary land of luxurious abundance without labor. London has been famed for its luxury from the earliest times—a veritable cocagne; and its inhabitants have now appropriated the name of cockneys.

COCKPIT, in a ship of war, is a room near the after-hatchway, under the lower gun-deck; it adjoins the surgeon's cabin and the surgery. It contains the medicine-chests for the entire crew, and is the place where wounded men are attended to during an action.

COCK OF THE PLAINS, *Tetrao* or *Centrocercus urophasianus*, the largest of the North American species of grouse. It is about one third smaller than the European capercailzie (q.v.), or cock of the woods. Its plumage is dense and soft, the prevalent color yellowish-brown, but beautifully mottled and varied with darker tints; the under parts white, with dark streaks and patches. On each side of the neck is a large bare space, capable, when the bird struts, of being inflated into a hemispherical sac. The female is smaller, and of less showy plumage than the male, and is destitute of the neck-sacs. This bird is an inhabitant of the desolate plains on the upper parts of the Columbia, and in the interior of California, living in flocks, and often feeding so much on species of *artemisia* that its flesh is almost too bitter to be eaten.

COCK'ROACH, *Blatta*, a genus of orthopterous (q.v.) insects, having an oval or orbicular flattened body, the head, hidden beneath the large plate of the prothorax, long thread-like antennæ, and wings folded only longitudinally. The elytra are parchment-like, and the wings are sometimes very imperfectly developed, particularly in the females, as in the case of the common cockroach. The eggs of these insects are collected in a sort of a shell fixed to the abdomen of the mother, which at last she deposits in a suitable situation, attaching it by a glutinous secretion. The larvæ, when hatched, discharge a fluid which softens the cement that holds together the toothed edges of a longitudinal slit in this remarkable shell, and emerging through it, at once enter upon active life. They are very similar in form to the perfect insects, and, like them, very voracious. Cockroaches are most numerous in warm countries, and even the common C. (*B. orientalis*)—now so well known in Britain, a pest in many houses, particularly in towns, and, although not a coleopterous insect, often called the BLACK BEETLE—is said to have been imported from abroad, but its native country is uncertain. It is a nocturnal insect, concealing itself in holes during the day, and fleeing on the approach of a candle. It devours both animal and vegetable substances; and a dark-colored fluid, which it emits from its mouth, gives a disgusting smell to everything that it passes over. A tame hedgehog is of great use for reducing the number of cockroaches in kitchens and other places where they abound. Another excellent method of getting rid of cockroaches, is to place a washing-basin on the floor, with some treacle in the bottom. A piece of wood resting between the floor and the edge of the basin, conducts the C. to the fatal trap, from which the slipperiness of the sides of the basin prevents their exit. In this way thousands of "black beetles" may be caught in a single night. The common C. is only about an inch long, but some of the tropical ones are much larger, and are more troublesome because of their frequent use of their wings. The KAKERLAC, or American C. (*B. Americana*), a native of the warm parts of America, has found its way into Europe, and infests some seaport towns. A small species (*B. lapponica*) is very common in Lapland, sometimes doing great injury by devouring the winter stores of salted fish.

COCKS'COMB, *Celosia cristata*, an annual plant of the natural order *amarantaceæ*, a native of the East Indies, one of the most familiar inmates of our hothouses and conservatories, often also planted out in warm borders, especially in the southern parts of Britain. It grows with an upright stem, which becomes flattened upwards, divides, expands, and forms a sort of wavy crest, covered with pointed bracts, and bearing on its surface many very small flowers, so crowded as often to present a rich velvety appearance. The colors are various, and often very brilliant.

COCK'S-FOOT GRASS, *Dactylis*, a genus of grasses, having the panicle of flowers much on one side of the stem, its secondary branches so short that the spikelets are much crowded into clusters; the glumes unequal, the larger one keeled; each spikelet containing 2 to 7 florets, each of which has two lanceolate scarcely awned paleæ. This genus is closely allied to fescue (*festuca*), but differs in habit. The common or rough cock's-foot grass (*D. glomerata*) is a native of Europe, Asia, North America, and the n. of Africa. It is very abundant in Britain, growing in tufts by waysides, in meadows, woods, etc., from the level of the sea to high altitudes on the mountains. It forms an important part of almost all the best natural pastures, is much relished by cattle, and grows with great rapidity after it has been cut, yielding a large quantity of herbage, and succeeding well on most kinds of soil, and in situations too shady for many other grasses. It is therefore generally sown along with other grasses. An improved variety.

of greater size than the ordinary one, has been introduced into cultivation. In America, this grass is called ORCHARD GRASS, and is extensively cultivated. To this genus belongs also the TUSSAC GRASS (q.v.).

COCK'S-SPUR THORN. See CRATÆGUS.

COCKSWAIN, or COXSWAIN (pronounced *cosn*), on board ship, is the steersman of a boat and commander of the boat's crew. He is expected to have his men always ready for service at short notice, and is furnished with a whistle to summon them.

COCLES, HORATIUS, "the one-eyed," one of the mythical heroes of ancient Rome, who, aided by Lartius and Herminius, defended the Sublician bridge against a great army under Lars Porsena, keeping the enemy at bay until the Romans behind them destroyed the bridge. When the bridge was about to fall, Cocles sent his two companies back; and when it had fallen, sheathing his sword and praying the river to favor him, he plunged in and swam safely to the shore. He was given as much land as he could draw a plow around in a day, and a statue in the comitium. No hero was held in higher honor, and Roman writers never wearied of telling what Macaulay repeats in his spirited *Lays of Ancient Rome*, "How well Horatius kept the bridge, in the brave days of old."

COCK OF THE WOODS. See CAPERCAILZIE.

CO'COA, CACA'O, or Co'co. The different kinds of C. either consist of, or are prepared from, the seeds of trees of the genus *theobrōma*.

The genus *theobrōma* (Gr. food of the gods) belongs to the natural order *byttneriaceæ*, and contains a number of species, trees of moderate size, with large undivided leaves and clustered flowers, all natives of the tropical parts of America. It is distinguished by a 5-leaved calyx; 5 petals, concave at the base, and extended into a strap at the apex; the stamens united at the base into a cup, which is divided upwards into 10 segments, 5 tips being without anthers, and the other 5, alternate with them, bearing 2 anthers each; a thread-like style, terminating in a 5-partite stigma; the fruit a 5-angled capsule, of a substance between leathery and woody, not splitting when ripe, 5-celled, and containing many seeds in a pap-like or butter-like pulp. The seeds of several species yield more or less of the C. of commerce. By far the most important species of this genus is *T. cacao*, to which the name cocoa-tree is often exclusively appropriated. It is extensively cultivated in tropical America and the West Indies, and its cultivation has been introduced into some parts of Asia and Africa. It generally rises with a bare stem to the height of only 6 or 7 ft., dividing into many branches, and attaining a height of only 16 or 20 ft. altogether, although it is sometimes twice that height. The fruit is somewhat like a cucumber in shape, and is 6 or 8 in. long, yellow, and red on the side next the sun; the rind is thick and warty, the pulp sweetish, and not unpleasant; the seeds numerous, compressed, and not unlike almonds, with a thin, pale, reddish-brown, fragile skin or shell, covering a dark-brown, oily, aromatic, bitter kernel, which consists mostly of the wrinkled cotyledons. These seeds are the *C. beans* of commerce; when bruised so as to be reduced to small pieces, after being shelled or decorticated, they become *C. nibs*. The cocoa-tree produces larger seeds in cultivation than in a wild state. The tree attains its full vigor and productiveness in seven or eight years, and generally yields two principal crops in the year. When gathered, the fruit is subjected to five days' fermentation in earthen vessels or in heaps on the ground, and then opened by the hand, and the seeds dried by the sun or by fire; or it is buried for a while in the earth, till the pulp becomes rotten. The latter method is said to produce the best cocoa (*earthed C.*, or *cacao terré*).

C. is very nutritious. The principal constituent of C. beans is the soft, solid oil called *C. butter*, which forms more than 50 per cent of the whole shelled bean, about 22 per cent being starch, gum, mucilage, etc., and 17 per cent being gluten and albumen. They contain also a crystallizable principle called *theobromine*, analogous to caffeine (q.v.), but more nitrogenous.

For dietetic use, C. is prepared in several ways. It is made into chocolate (q.v.); it is crushed into *C. nibs*, the purest state in which C. can be purchased in shops; or the unshelled bean is powdered in a hot mortar, or between hot rollers, which yields a paste capable of being mixed with sugar, honey, starch, etc., sold in shops under the name of soluble C., rock C., and common cocoa.

C. is eaten in the solid state in the form of cakes and bonbons, or is scraped down, and treated with boiling water or milk. When C. nibs are infused with water like coffee, they yield a highly palatable beverage, which is much lighter than any other infusion of cocoa. The large quantity of oily matter present in the bean tends to make the various infusions thick and heavy, so that they do not agree with some delicate stomachs. The annual consumption of C. is upwards of 100 millions of pounds.

An infusion of the broken and roasted shells of cocoa-beans is sometimes used in the same way as tea or coffee. The pulp of the fruit is eaten in the countries in which the tree grows, and a kind of spirit is obtained from it by fermentation and distillation.

CO'COA-NUT, or Co'co-NUT, the well-known fruit of a species of palm, *cocos nucifera*, perhaps originally a native only of the Indian coasts and South Sea islands, but now diffused over all tropical regions. The cocoa-nut palm belongs to a genus having pinnate leaves, and male and female flowers on the same tree, the female flowers at the base of

each spadix. The genus is further distinguished by a simple 3-celled ovary, which is succeeded by a coarse, fibrous, 1-celled drupe, two of the cells becoming abortive. There are about 18 known species, all natives of South America, except the most important, the cocoa-nut palm itself. The American species prefer dry and somewhat elevated districts. The cocoa-nut palm, on the contrary, is seldom found at any considerable distance from the sea-coast, except where it has been introduced by man, and generally succeeds best in sandy soils near the sea. It is always one of the first of the larger plants to establish itself in the low islands of the Pacific ocean, so soon as there is soil enough. It has a cylindrical stem, about 2 ft. in diameter, and from 60 to 100 ft. high, with many rings marking the places of former leaves, and bearing at its summit a crown of from 16 to 20 leaves, which generally curve downwards, and are from 12 to 20 ft. in length. The flowers proceed from within a large pointed spathe; the fruit grows in short racemes, which bear, in favorable situations, from 5 to 15 nuts; and 10 or 12 of these racemes, in different stages, may be seen at once on a tree, about 80 or 100 nuts being its ordinary annual produce. The tree bears fruit in from 7 to 8 years from the time of planting, and continues productive for 70 or 80 years. Of the three round black scars at one end of the shell, the one which alone can be easily pierced with a pin, and through which an opening is commonly made to get out the *milk*, is the destined outlet of the germinating embryo, which is situated there, the kernel consisting generally of the albumen (q.v.) destined for its nourishment. The thick husk is remarkably adapted to the preservation of the seed, whilst the nut is tossed about by the waves, until it reaches some shore far distant from that on which it grew.

The Cocoanut affords to the inhabitants of many tropical coasts and islands great part of their food; it is not only eaten as it comes from the tree, both ripe and unripe, being filled in a young state with a pleasant milky fluid, but is also prepared in a variety of ways, as in curries, etc.

The kernel of the cocoa-nut contains more than 70 per cent of a fixed oil, called Cocoa-nut Oil, or Cocoa-nut Butter. The oil is itself an important article of commerce, being much employed in Europe, particularly for the manufacture of *stearine candles;* and also of a *marine soap*, which forms a lather with sea-water. In tropical countries, and particularly in the east, it is much used as a lamp oil, and as an unguent. It is also employed as an article of food, so long as it remains free from rancidity, to which, however, it is very liable. It is obtained by pressure of the bruised kernel, or by boiling over a slow fire, and skimming off the oil as it floats on the surface. A quart, it is said, may be obtained from seven or eight cocoa-nuts. It is liquid in the ordinary temperatures of tropical countries, but in colder climates becomes a white, solid, butter-like oil. It becomes liquid about 74° F. It can be separated by compression in the cold into a more liquid portion called *olein*, and a more solid part termed *cocostearin*, or *cocosin*, which is of complex constitution, and contains at least six fatty acids. Cocoa-nut oil is not a good lamp oil, as it chars on the wick, and burns with smoky flame. This remark applies also to the *olein* obtained from it, which, however, is used mixed with sperm oil, but it lowers the value of the sperm oil. Cocoa-nut oil and resin melted together yield a substance capable of being used with success in filling up the seams of boats and ships, and in tropical countries, for covering the corks of bottles, as a protection from the depredations of the white ants.

The root of the cocoa-nut palm possesses narcotic properties, and is sometimes chewed instead of the areca-nut.—When the stem is young, its central part is sweet and eatable; but when old, this is a mass of hard fiber.—The terminal bud (*palm cabbage*) is esteemed a delicacy, and trees are often cut down for the sake of it.—The saccharine sap (*toddy*) of the Cocoa-nut, as of some other palms, is an esteemed beverage in tropical countries, either in the state in which it is obtained from the tree, or after fermentation, which takes place in a few hours; and from the fermented sap (*palm wine*), a spirituous liquor (*arrack*) is obtained by distillation. The juice is often also in the East Indies boiled down to yield sugar (*jaggery*).

The dried leaves of the cocoa-nut palm are much used for thatch, and for many other purposes, as the making of mats, screens, baskets, etc., by plaiting the leaflets. The midribs of the leaves supply the natives of tropical coasts with oars.—The wood of the lower part of the stem is very hard, takes a beautiful polish, is employed for a great variety of purposes, and is imported into Britain for ornamental joinery, under the name of Porcupine Wood.—The fibrous center of old stems is made into cordage.—By far the most important fibrous product of the cocoa-nut-tree is Coir (q v.), the fiber of the husk of the imperfectly ripened nut. The husk of the ripe nut is used for fuel, and also, when cut across, for polishing furniture, scrubbing floors, etc.

The shell of the cocoa-nut is made into cups, goblets, ladles, etc., and is often finely polished and elaborately ornamented by carving.—Within the nut there is occasionally found a small stony substance, of a bluish-white color, "a sort of vegetable bezoar," called in India *calappa*, which is eagerly purchased by the Chinese, who ascribe great virtues to it as a sort of amulet to preserve them from diseases.

Cocos butyracea, one of the South American species of this genus, is a very large tree, and its nut abounds in an oil and butter of similar quality to that obtained from

the cocoa-nut.—The DOUBLE COCOA-NUT of the Seychelles islands is the fruit of a palm of a different genus.

COCOA-NUT BEETLE, *Batocera rubus,* a large beetle of the family *longicornes* (q.v.), tribe *lamiariæ,* the larvæ of which are very destructive in cocoa-nut plantations, eating their way in all directions in the stems of the younger trees. They are destitute of feet, large and pulpy, and of repulsive aspect; but are esteemed a luxury by the coolies of the east. They resemble the *grugru worms* of South America.

COCOA-PLUM, an edible fruit growing on a shrub of the order *rosaceæ,* in the West Indies, and some of the s.w. United States. It is yellow, purple, or black, and is much like a large plum in appearance.

COCO-MARICOPAS, or MARICOPAS, a tribe of Indians, in New Mexico, on the Gila river, occupying the same territory with the Pinos, who are advanced in civilization to a like extent. The joint reservation is about 25 m. long and 4 m. wide. Both tribes are cultivators of the soil, and raise large crops. They live in villages of 20 to 50 houses, usually surrounded by gardens and cultivated fields. Their houses are built of corn husks and straw, and are supported by stakes. Attached to each house is an open booth or wigwam where they pass their time in fair weather. Each family has also a granary or storehouse; and they have horned cattle, horses, and mules. Their food is chiefly bread, made of flour and corn meal, and vegetables. They raise cotton, and make good cloth therefrom. Their basket work and pottery also are good. The women wear simply a long strip of cotton cloth wound around the loins, and sandals made of raw hide on the feet. Their heads are bare, and the hair is left to hang freely down the back. Except for a breech cloth the men go naked, but in cool weather use blankets. The hair is never cut except over the eyes, and there it is "banged," as the style is called in these days. They believe in a great spirit, and in an existence after death, and avoid polygamy. They say that their souls will go to the banks of the Colorado, the dwelling place of their ancestors, and there be changed into various animals or birds, and also that feuds with other tribes will continue in the future existence. Their language is allied to that of the Yumas of Colorado. There is little doubt that they are descended from the strange people who left such remarkable cities and fortifications in that part of America. At the last census they numbered only 382 persons.

COCOON, a silken envelope which the larvæ of many insects spin for themselves immediately before their transformation into the pupa state, and which serves for the protection of the inactive and helpless pupa. The name is sometimes extended to coverings formed of other materials, by agglutination or otherwise. Many insects mix foreign materials of various kinds with their silken cocoons; some caterpillars, as those popularly called *woolly bears,* working into them the hairs with which their own bodies were previously covered; and others fastening together the sides of a leaf or of several adjacent leaves. Some of the moths, which attach their silk to leaves, so that the leaf itself forms part of the protective covering of the pupa, proceed with a mathematical nicety as to the position and direction of their threads, more wonderful, if possible, than even that exhibited by bees in the building of their comb. The silken substance of which cocoons are made, is produced much more abundantly by some kinds of larvæ than by others; the cocoons of some being only an open net-work, whilst others form a compact ball. The C. of the common silk-worm exhibits externally a loose gauze-like covering, within which is a close and compact oval ball; yet all is of one continuous thread, which may be unwound from it 1000 ft. long. Different parts of this thread are of different qualities, but the stronger part of it may be unwound as easily as a ball of cotton. The insect works from the outside inwards, and the outer parts of the C. are produced first. The spinnerets by which the C. of the silk-worm and those of other moths are produced, are situated at the mouth of the caterpillar; but the larvæ of a few insects—not lepidopterous—have them at the opposite extremity of the body. The time occupied in spinning the C. is very various in different insects; in the silk-worm, it extends to several days.

CO'CUM OIL, a solid oil or vegetable butter, obtained from the seeds of *garcinia purpurea,* an Indian tree of the same genus with the mangosteen. It is white or pale greenish-yellow, brittle or friable, with a faint and not unpleasant odor. It melts at 95° F., but when cooled after being melted, remains liquid to 75° F. It is used for mixing with ghee (butter), and is exported to Britain for mixing with bear's grease in the manufacture of pomatum.

COCY'TUS, the name given by the ancients to a river of Epirus, fed by the snows of Pindus, and which, after a long underground course, was regarded as falling into the Acherusian lake.—Cocytus was also the name of a river of the infernal regions, a branch of the Styx.

COD, *Gadus morrhua,* or *Morrhua vulgaris,* a fish of the family *gadidæ* (q.v.), almost rivaling the herring in its importance to mankind. The genus to which it belongs is distinguished by having three dorsal fins, two anal fins, and a barbule beneath the chin. The C. sometimes attains a weight of 100 lbs.; but even from a small size, it is in request for the market and the table. The roe of the female has been esti-

mated to contain from four to nine millions of eggs, a reproductive power which seems beneficently intended to provide supply for far more extensive fisheries than are yet carried on. The C. is found in all the northern parts of the Atlantic ocean, and in the arctic seas; it is not known in the Mediterranean. It occurs both on rocky coasts and on sandbanks, where the largest are usually caught in depths of from 25 to 50 fathoms. The productiveness of the great banks of Newfoundland excels that of all others, but the cod-fisheries near the coasts of Sweden, Iceland, and the n. of Scotland, are also important. The Dutch were engaged in the cod-fishery as early as the middle of the 14th c., and the English resorted for this purpose to the coasts of Iceland about the same period. The French have also engaged largely in the cod-fishery. More than 6,000 European vessels are said to be employed in it, besides boats along the shores. The fishery is always carried on by means of lines and hooks, partly by *long-lines* and partly by *hand-lines*. One man has been known to catch from 400 to 550 fish, on the banks of Newfoundland, in 10 or 11 hours; and 8 men to take eighty-score in a day on the Dogger bank. The C. is very voracious. Small fishes, shell-fish, etc., are used for bait. The C. is used as food, either fresh, salted, or dried. Great quantities of dried C. are carried from Newfoundland to the West Indies, and are consumed also in the Roman Catholic countries of the s. of Europe. *Cod sounds* are esteemed a delicacy, and are often salted, and so sent to market. They are also used in a dried state as isinglass. The recent discovery of the medicinal value of cod-liver oil (q.v.) has added to the economical importance of this fish.

ROCK C. and RED C. are names given to the common C. when its color is somewhat affected by living among weedy rocks.—BALTIC C. is a name of the dorse (q.v.).

CODA, in music, is the ending or winding-up of a composition by an extra-melodic phrase, for more completely establishing the final cadence. It may be compared to the peroration of an oratorical discourse.

CODDINGTON, WILLIAM, 1601–78; a native of Lincolnshire, Eng., and founder of the colony of Rhode Island. He came out in 1630 with a commission as magistrate, landing at Salem, and was for some time a trader in Boston. He undertook the defense of Ann Hutchinson, and opposed similar persecution in other cases, but without success. April 26, 1638, he, with eighteen others, removed to the island of Aquidneck and founded a colony, which was to be judged and guided by the laws of Christ. He was elected judge and governor in 1640, and held the office until the colony was incorporated in the charter with Providence plantations. In 1651, he went to England, where he was granted a commission as governor of Aquidneck island, independent of the remainder of the colony, but he never undertook to exercise the authority, and soon resigned. In 1674, he was once more made governor.

CODE (Lat. *codex* and *caudex*), the primary meaning of the Latin word was the trunk or stem of a tree; latterly, it came to signify more especially wooden tablets bound together, and covered with a coating of wax, which were used for writing on. After parchment and paper were substituted for wood, the name C. was still retained. Cicero applies it to a bill; but it was not till still later, in the times of the emperors, that it was used to express a collection of laws and constitutions.

Codes, Roman.—1. *Codex Gregorianus and Hermogenianus.*—The term *codex* never was applied to the laws of the twelve tables, and the earliest collections so called were those of Gregorianus or Gregorius, and Hermogenianus. Of these, whether two separate collections, or two parts of one collection—a disputed point—we have only fragments. They never received the imperial authority, but they were quoted as authoritative compilations in the courts, and they supplied the models on which the subsequent works of Theodosius and Justinian were executed.

2. *Codex Theodosianus.*—This compilation was executed by a commission of eight persons, appointed by Theodosius the younger in the year 429, and afterwards increased to sixteen. The work was completed and published, or rather promulgated, as law throughout the eastern empire in 438, and declared to be a substitute for all the constitutions made since the time of Constantine. In the western empire also, having been laid before the senate, it was confirmed as law in the same year by Valentinian III., the son-in-law of Theodosius. Nine years later, the new constitutions (*novellæ constitutiones*), which had been made since the promulgation of the C., were likewise promulgated in the western empire. The name of novels (*novellæ*) continued to be given to all the constitutions issued subsequent to the date of the Theodosian C. up to the overthrow of the western empire. The C. of Theodosius has been, in a great measure, preserved. It consists of sixteen books, which are subdivided into titles and sections. The best edition is that of J. Gothofredus (6 vols. fol., Lugd. 1665), which was re-edited by Ritter (Leip. 1736–45). This edition contains the Theodosian C. entire, except in the first five, and part of the sixth book, for the reproduction of which the breviary or abridgment prepared by the orders of Alaric II., king of the Visigoths—which itself may be regarded as another C.—formed the only guide. Some recent discoveries of MS. and palimpsests have added considerably, not only to our critical knowledge of the contents of this C., but have enabled us to restore several of the genuine constitutions of the first five books. Of the 262 laws and fragments of laws, which were omitted in the breviary, 62 have been thus restored (see *Jus Civile Antejustin.*, Berol. 1815).

3. *Codex Justinianeus.*—In 528, the emperor Justinian appointed a commission of ten persons, one of whom was the celebrated Tribonian (q.v.), to compile a C., incorporating in it the previons codes of Gregorianus, Hermogenianus, and Theodosius, and also the constitutions (q.v.), rescripts (q.v.), and edicts (q.v.), subsequently issued. The work was performed in fourteen months, and it was then declared that the new C. should supersede the older compilations. A second edition of this work, revised, and having subsequent constitutions, etc., incorporated (*Codex Repitiæ Prælectionis*), is what we now know as the C. of Justinian. It consists of twelve books, divided into titles.

Gothic C.—The laws of the barbarians were all collected into a single C., which bore the title of *Codex Legum Barbarorum*. Of these various systems, the first was that of Alaric, king of the Visigoths, mentioned above, augmented by the legislative labors of his successors. To this C. was given the title of the Gothic law, *par excellence*, and it was the best and fullest of all the barbarian codes. The second C. comprised in the collection was that of the Burgundians; the third, the Salic law (q.v.), composed when the Franks issued from their German forests; the fourth, the law of the Frisians, which dates from the times of their conquerors, Pepin and Charles Martel. These, and all the other codes by which the tribes of the n. which overthrew the empire were governed, merged at last in the feudal system, and a mass of local customs speedily arose which introduced the greatest uncertainty into jurisprudence.

French Codes.—Charles VII. was the first of the kings of France who attempted, by a series of general *ordonnances*, to introduce something like uniformity into the legislation of France; and several of his successors, in particular Louis XI. and Henry III., entertained the idea of establishing a single C. for the whole kingdom. A C., having this object in view, was subsequently prepared by Michel de Marillac, and published in 1629. It consisted of 471 articles, and is spoken of by French jurisconsults in terms of the highest praise. Its reception, however, was very partial, confined indeed to the jurisdiction of the parliament of Dijon. Louis XIV., who, amongst his other ambitions, affected that of becoming the French Justinian, published a series of very important ordonnances, embracing most of the leading departments of the law. The work was executed by a commission composed of the most distinguished magistrates and advocates of the kingdom, and before the various ordonnances received the royal assent, the king caused them to be discussed with the principal officers of parliament. Minutes of these discussions have been preserved, and they constitute one of the most precious monuments of the history of French jurisprudence. Many important chapters were subsequently added to this C., before it assumed the form in which, as the C. of Louis XV., it represents the condition of French jurisprudence previous to the revolution.

Such, with the addition of sundry attempts at legislation during the period of anarchy which succeeded, was the position of affairs when Napoleon assembled that brilliant band of jurisconsults—Tronchet, Portalis, Merlin, Bigot-Préameneu, Treilhard, Pensey, etc.—by whose labors, aided in no insignificant degree by that marvelous insight into human affairs which he himself possessed, the modern legislation of France, and of no small portion of the rest of Europe, was called into existence. Such was the energy which he contrived to bring to bear on the work, that the vast edifice of the C. Napoleon, or C. Civil, was reared in a single year, the first title having been promulgated on 5th Mar., 1803, and the last on 30th Mar., 1804. The C. de Procédure Civile followed in 1806, the C. de Commerce in 1807, the C. d'Instruction Criminelle in 1808, and two years afterwards, the C. Pénal. The period of the restoration produced several codes of less importance—forest-laws, fishing-laws, etc. The C. Napoleon received the force of law in the countries which were successively subjugated by France; in Italy, in the kingdom of Holland, in the Hanseatic departments, in the grand duchy of Berg. In the Rhenish provinces and in Belgium, it still forms the basis of legislation. Several other countries have since codified their legislation, in most cases adopting modifications of the C. Napoleon.

CODE (*ante*) is defined in the United States as a body of laws established by the legislative authority of the state, and designed to regulate completely, so far as a statute may, the subjects to which it relates. The earliest and most complete code of the American states is that of Louisiana, finished in 1824, the work of Edward Livingston, a member of the celebrated family of that name in New York, and was based on the code Napoleonenne. It has 3,523 articles in one series, but comprises three books—1. of Persons; 2. of Things, and the Modification of Property; 3. of the Different Modes of Acquiring Property. A code was completed in Massachusetts in 1835, and it was revised 20 years later. New York's first code formed the revised statutes of 1830. There have been various more or less complete revisions, and there is the whole or a part of a further revision now before the legislature. All except the latest new states have compilations of codified editions of their laws. David Dudley Field of New York has been active and eminent in the work of codification. See FIELD, DAVID DUDLEY.

CODEIA, an alkaloid existing in opium with meconis acid; formula, $C_{35}H_{21}ONO_5$. It is insoluble in alkaline solutions, but soluble in ether, alcohol, or water.

CODEX (pl. CODICES: for derivation see preceding article), the name applied to ancient manuscript copies of the Scriptures.

CODEX (*ante*), originally the Roman name for the trunk of a tree, and also applied to the smooth tablets smeared with wax on which the Romans wrote their records. It finally came to mean any written document, but especially designating collections of laws. Modern scholars give the title to versions of the Scriptures, and sometimes to important secular manuscripts (see CODE, *ante*, for some of these codices; and also under their several names, such as ALEXANDRIAN CODEX, etc.).

CODEX ALEXANDRINUS. See ALEXANDRIAN CODEX, *ante*.

CODEX BEZÆ, or CODEX CANTABRIGIENSIS, a manuscript believed to have been written in the 6th c., containing the four gospels and the Acts in Greek and Latin on opposite pages. It was found in a monastery at Lyons, France, and presented to Cambridge university in 1581 by Theodore Beza.

CODEX EPHRAE'MI, a palimpsest manuscript of portions of the Greek Bible preserved in the national library in Paris. It is judged to be as old as the 5th c., and in critical authority it ranks next to the Sinaitic, Vatican, and Alexandrian manuscripts.

CODEX SINAITICUS. See SINAITIC CODEX.

CODEX VATICANUS. See VATICAN CODEX.

COD'ICIL, a supplement to a will, whereby anything omitted is added, or any change demanded by the altered circumstances of the testator or the beneficiaries, is effected. A C. is authenticated in the same manner as a will, and possesses the same privileges when holograph, or written by the hand of the testator himself. See TESTAMENT, WILL.

CODIFICA'TION, the act of forming a code (q.v.), or systematic collection of laws. Though a code, in the wider sense, comprehends frequently the whole legislation of a country, there is a narrower sense in which the term is applied to a particular branch of legislation, such as commercial law, criminal law, marine, etc. In this latter sense, some of our general acts of consolidation, such as the merchant shipping act of 1854 (17 and 18 Vict. c. 104), may almost lay claim to the character of codes. All attempts at C. in the wider sense in England have failed, notwithstanding the earnest advocacy of lord Brougham. The department in which it seems to be most hopeful is the law-merchant, in which, being necessarily cosmopolitan beyond the other departments of the law, great benefit may be derived from the labors of our continental neighbors. See CODE.

COD'LIN, the name given to a number of varieties of apple, chiefly used for culinary purposes. Some of them are in high repute in Britain, both on account of the quality of the fruit and the productiveness of the tree. The fruit cannot easily, however, be kept long. In most of the varieties which bear this name, it is large and somewhat conical. The trees are often propagated by layers or suckers, or even by slips, plants thus obtained becoming fruitful much sooner than grafted trees.

CODLIN MOTH, *Pyralis pomona*, a small moth which is very injurious in apple orchards in some parts of Britain, laying its eggs in the eyes of the newly-formed fruit, within which the larva feeds, so that the growth of the fruit is arrested, and it falls prematurely off. The moth is one of the *tortricidæ*, agreeably colored, with rather short and broad wings. The caterpillar has 16 feet.

COD-LIVER OIL is generally obtained from the livers of the common cod (q.v.), but likewise from allied species, as ling, dorse, coal-fish, torsk, etc. In these fish, the adipose tissue (q.v.) containing oil, is almost entirely confined to the liver, in which they agree with the shark tribe, whilst in other fish, as in the herring and salmon, the oil is diffused over the entire structure of the animal. Cod-liver oil is prepared largely in Britain, Norway, and Newfoundland. There are three varieties of the oil sold in commerce—*pale cod-liver oil*, *pale-brown cod-liver oil*, and *dark-brown cod-liver oil*.

In the preparation of the oil, the livers are placed in a tub with a layer of spruce boughs at the bottom, and subjected to pressure, when the light-colored or pale oil exudes, and is run off by an opening at the lower part of the tub. As the livers partially putrefy, more oil escapes, which is darker than that procured from the fresh livers, and constitutes the pale-brown oil; whilst the residual livers being boiled with water, part with the remaining oil they contain, and yield the dark-brown oil. The pale oil thus approaches more nearly the condition in which the oil is present in the livers, while the other varieties are more or less impregnated with the products of the putrefaction of the livers. The purer oil has a peculiar fishy odor and taste, which is not disagreeable, although it remains for a little time, and in some cases requires a little practice to get accustomed to it. The darker varieties have more or less of a disagreeable empyreumatic odor and taste, and leave in the throat an unpleasant nauseous sensation, more difficult to overcome.

The oil mainly consists of oleic and margaric acids, in combination with glycerine, and holding in solution the constituents of the bile, acetic acid, a phosphorized oil, as also iodine and bromine. These ingredients are most largely present in the light-colored oil. Cod-liver oil is occasionally adulterated with more or less train-oil, to which a little iodine has been added. In the purer varieties of cod-liver oil, the presence of

any such admixture can be at once observed from the disgusting odor, although in the darker varieties of cod-liver oil the test of odor cannot be relied on.

As a remedy, cod-liver oil has a great reputation as efficacious in the treatment of scrofulous and tubercular diseases, and especially in consumption (q.v.); it has also been used extensively in chronic rheumatism, in rickety affections, and in other diseases of the bones and joints. The virtues of cod-liver oil have been ascribed to iodine, bromine, and other specific ingredients; but, on the whole, the most probable view of its action is that it is simply a fattening agent—a fatty food—and that it acts by nourishing the system in cases attended with emaciation, just as new milk, cream, and butter, or fat bacon, will sometimes act in similar cases. Cod-liver oil is often found to be more easily digested than, from its somewhat disagreeable odor and taste, might have been expected. Children, in particular, often take it readily; and in emaciated old people, it is sometimes of great service in conjunction with remedies suited to the peculiar character of the case. In true tubercular consumption, it has for some years enjoyed a great reputation; but it is very far from having anything like a specific remedial action in that disease. Cod-liver oil is commonly taken in doses of from a dessert-spoonful to a table-spoonful three times a day; but a pint, or even more, is said to have been consumed daily in some instances with good effect, or at least without injury.

CODOGN'O, a t. of Lombardy, northern Italy, situated in a rich district between the Adda and the Po, about 15 m. to the s.e. of Lodi. It is well built, and has manufactures of silk and linen, and a great trade in cheese. Pop. 9,632.

COD'RINGTON, Sir EDWARD, G.C.B., etc., a distinguished British admiral, third son of Edward Codrington, esq., was b. in 1770, and entered the navy in 1783. In 1794, he was lieut. of the *Queen Charlotte*, lord Howe's flag-ship, in the actions of the 28th and 29th May and 1st June. At the battle of Trafalgar, in 1805, he was capt. of the *Orion*, 74. He afterwards served in the Mediterranean, and in North America, and rose to the rank of vice-admiral in 1821. On Nov. 1, 1826, he was appointed commander-in-chief of the Mediterranean squadron, and in that capacity took the leading part in the battle of Navarino (q.v.). In reward for this victory he received the grand cross of the bath, with Russian and French orders; but the battle being considered an "untoward event," C. was recalled. He attained the full rank of admiral of the red in 1837, and in 1839, was appointed commander-in-chief at Portsmouth. He was M.P. for Devonport from 1832 to 1839. He died April 28, 1851.—His son, GENERAL SIR WILLIAM JOHN CODRINGTON, G.C.B., was commander-in-chief in the Crimea, 1855–56: and was promoted to the rank of gen. in 1863. The brother of the last mentioned, ADMIRAL SIR HENRY JOHN CODRINGTON, K.C.B., took part in the destruction of St. Jean d'Acre, and became an admiral in 1867.

CO'DRUS, the last king of Athens, was the son of Melanthus, and, according to Grecian legend, sacrificed his life for his country about the year 1068 B.C. A war raging between the Athenians and Dorians, the oracle declared that the victory should belong to those whose king was slain by the enemy; whereupon C., attiring himself as a peasant, entered the Dorian camp, and having picked a quarel with some of the soldiers, contrived to have himself slain. His son, Medon, was made archon (q.v.) for life, on the pretense that no one was worthy to succeed such a man as king. The accounts, however, which have come down to us, indicate that the sons of C. had quarreled about the succession after their father's death, and it is more probable that the aristocratic families (the Eupatrids) took advantage of the opportunity presented to them, of diminishing the regal authority by abolishing the name.

COËFFI'CIENT (Lat. together-making) is the name given in algebra to the known or constant factor of an unknown or variable quantity. Thus, in the expressions $4x$ (4 times x), bz (b times z), 4 and b are coefficients of x and z, b being supposed known as well as 4, and x and z unknown or variable. Strictly speaking, in a product, such as 3×5, $4\times x$, or $b\times z$ ($=bz$), either of the two factors is a C., since they "together make" the product; but in practice, the meaning is restricted as above explained.

COEHOORN, or **COHORN**, MENNO, Baron Van, called the Dutch Vauban, was b. at Lettingastate, near Leeuwarden, in 1641, and studied fortification and mathematics under his uncle Bernardus Fullenius, then professor of these sciences at Franeker. Prince Henry Casimir, stadtholder of Friesland, apprised of the youth's great abilities, appointed him, in his 16th year, capt. of a company of infantry; and in 1674, C. greatly distinguished himself at the siege of Maestricht, and in various battles. At the siege of Grave, in 1674, he demonstrated that small portable mortars might be advantageously employed (see next art.); and also that the combined effect of a certain mass of projectiles is much greater than the effect produced by a successive discharge of the separate projectiles composing the mass. The application of this principle distinguishes the operations of Coehoorn. C. covered himself with honor before Kaiserwerth (June) and Bonn Oct., 1689), and the elector of Brandenburg wanted to make him maj.gen., a promotion he refused. He also distinguished himself in the battle of Fleurus, (July 1, 1690). He was now for some time in disgrace, but was soon sought again by William III. He fortified Namur, and defended his own intrenchment "William" against Vauban in 1692; besieged that fortress in 1695, and retook it; was appointed lieut.gen. and director-in-

chief of the Dutch fortifications, and fortified several towns, of which Bergen-op-Zoom may be considered his masterpiece. In 1702, he annihilated the French lines near St. Donat. He died at the Hague, Mar. 17, 1704. His principal works are *The New System of Fortification* (Leeuwarden, 1685) and *The Pentagon*.

COE'HORNS—named from the military engineer who invented or introduced them—are small howitzers or mortars, generally 4⅔ in. caliber. These implements of war, being easily moved and adjusted, and taking little powder, are found very useful in sieges, if grouped in great number. A battery of 30 or 40 C., by pouring their small shells or grenades into the outworks of a fortress, may prevent the garrison from effecting a strong occupation, or making a demonstration.

CŒ'LELMIN'THA (Gr. hollow worms), the name given by Owen to one of the two orders of entozoa (q.v.), or intestinal worms, having a distinct abdominal cavity and intestinal canal, the *vers intestinaux cavitaires* of Cuvier. Examples of this order are *ascaris*, *strongylus*, and *filaria*.

CŒLEN'TERA, a group of animals including the classes hydrozoa, anthrozoa, and cterophora. See ACTINIA, CORAL, and HYDROZOA, *ante*.

CŒLENTERATA. See SUB-KINGDOMS, ANIMAL.

CŒLE'-SYRIA (Hollow Syria), now called by the natives El-Bŭkâ'a, "the deep plain," a valley of Syria, extending between the ranges of the Lebanon and Anti-Lebanon. Near Bar Elias, it is 2,854 ft. above the sea. Its length is about 100 m., and its average breadth 10. In this valley stand the ruins of Baalbec and the village of Zahleh.

CŒ'LIAC AX'IS. See AORTA.

COEN, JAN PIETERSZOON, 1587–1630; the founder of Batavia, the capital of the Dutch East Indies. He went to India in 1607 on a commercial exploration, and in 1612 made his second voyage with two ships. The next year he was appointed director-general of the Indian trade, and in 1619 he destroyed the native town of Jacatra and founded Batavia on its site.

CŒN'OBITES (Gr. *koinos*, common, and *bios*, life), or SYNODITES, the name given to those monks who live together, in contradistinction to the anchorites (q.v.), or hermits, who withdraw from all society, and live in a solitary fashion. The first *cœnobium*, or monastery, was founded by Pachomius, a disciple of St. Antony, about the year 340 A.D., at Tabennæ, an island in the Nile. In a short time, it reckoned 1300 monks, and stimulated the establishment of numerous other monasteries in Egypt, Syria, and Palestine.

CŒNU'RUS. See CESTOID WORMS.

CŒUR, JACQUES, d. 1456; a native of Bourges, France, who opened trade between his country and the states of the Levant. In 1436, Charles VII. made him master of the mint just established in Paris, and in 1440 his family were ennobled. In 1444, he was sent as one of the royal commissioners to preside over the new parliament of Languedoc, and in 1448 he represented the French king at the court of Nicholas V., who treated him with great distinction, lodging him in the papal palace, and granted him a special license to traffic with the infidels. The power and fame of C. were now at their highest. He had represented France in three embassies, and had furnished the sinews of the war that had driven the English from Normandy. He was invested with various offices of dignity, and possessed the largest fortune ever amassed by a private French citizen. The sea was covered with his ships; he had 300 factors in his employ, and houses of business in all the chief cities of France. He had built hotels and chapels, and had founded colleges in Paris, at Montpellier, and Bourges. Dealing in all things—money and arms, peltry and jewels, brocades and woolens—broker, banker, farmer—he had absorbed all the trade of the country, and merchants complained that they could make no gains on account of "that Jacques." Very soon, however, he was a broken man and a fugitive. Charles was surrounded with the great merchants; he was as unstable as water, and always needy. C. had to go the way of others who had been the friends of the king. In Feb., 1449, Agnes Sorel, the king's mistress, died of puerperal fever. But it was charged that Louis (the dauphin) had procured her death; and a considerable time after she died, C., who was one of her executors, was accused of having poisoned her. There was not even a pretext for such a charge; nevertheless, the needy and unscrupulous king, in July, 1451, ordered his arrest and the seizure of his goods, reserving for himself a large sum to carry on the war in Guienne. He was tried and convicted by men whose business it was to convict him without regard to the evidence or to justice; and he was condemned to do public penance, to pay to the king a sum equal to $5,000,000 of modern money, and to remain a prisoner until the judgment was fully satisfied. All his property was confiscated, and he was subject to exile during the royal pleasure. In 1455, he managed to escape into Provence, and, though closely pursued, succeeded in reaching Rome, where he was well received by the pope, who was fitting out an expedition against the Turks. C. was given the command of 16 galleys, but he was taken ill at Chios, died, and was buried on the island.

COFFEE. This well-known beverage is an infusion of the roasted albumen of the seeds of the C. tree (*coffæa Arabica*), a native of Abyssinia and Arabia, but now naturalized in many of the tropical countries colonized by Europeans. There are a number of species of *coffæa*, but this one only is known to possess valuable properties; the seeds of *C. mauritiana* prepared in the same way, are bitter and slightly emetic. The genus belongs to the natural order *cinchonaceæ*. It has a tubular 4 to 5 cleft corolla, and a succulent fruit containing two cells lined with a cartilaginous membrane, and each containing one seed.

In a wild state, the C. tree is a slender tree of 15 to 25 ft. high, with few branches; in cultivation, it is seldom allowed to become more than 6 to 10 ft. high, and is made to assume a sort of pyramidal form, with horizontal branches almost from the ground. The leaves are evergreen, opposite, very shining, oblong, and leathery; the flowers are small, clustered in the axils of the leaves, and snow-white; the whole appearance of the tree is very pleasing; and the smell of the flowers is delicious. The fruit, when ripe, is of a dark-scarlet color, and the seeds are semi-elliptic, and of a horny hardness. The seeds are commonly termed *C. beans*, but this name is not derived from a resemblance to beans, which they have not, but from the Arabic word, *bunn*. They are sometimes, but very incorrectly, designated *C. berries*.

The C. tree succeeds only in countries where the average temperature of the year is about 64° to 70° F. In Peru and Quito, it is acclimatized at an elevation of 6,000 ft., where, however, frost never occurs; but as it delights in a moist atmosphere, it nowhere thrives better than in tropical islands. The fruit ripens in the hot-houses of Britain, where the C. tree frequently flowers. C. plantations are laid out pretty much in the same way everywhere. In quadrangles, bordered by fruit-trees, the C. trees stand in rows; they are pruned to the same height, and the ground between them is carefully kept clear of weeds. Where the climate is dry, abundant irrigation is necessary, but the supply of water is cut off as the fruit begins to ripen, in order to the improvement of its quality. The tree yields its first crop in the third year; the crop from a full-grown tree may amount to a pound of C. beans. As the C. tree continues flowering for eight months, its fruits are at any time of very unequal ripeness; in the West Indies and Brazil, three gatherings are therefore made annually. The beans are placed on mats or large floors specially adapted for the purpose, where they are dried by the sun's rays, being meanwhile frequently turned. They are passed between rollers to remove the dried pulp of the bean, and the membrane which incloses the seeds themselves, and the C. is afterwards freed from impurities by winnowing, and conveyed in bags to the seaports. As equal care is not, however, bestowed upon the preparation of it in all places where it is cultivated, there are great differences in quality and price.—The earlier history of the C. tree is not very clear. It was not known to the Greeks or Romans; but in Abyssinia and Ethiopia it has been used from time immemorial; and in Arabia it was certainly in use in the 15th c., and over the rest of the east in the 16th century. Towards the end of the 17th c., it was carried from Mocha to Batavia by Wieser, a burgomaster of Amsterdam, where it was soon extensively planted, and at last young plants were sent to the botanical garden at Amsterdam, from which the Paris garden obtained a tree. A layer of this was carried out to Martinique in 1720, where it succeeded so well, that in a few years all the West Indies could be supplied with young trees.

The following sorts are particularly distinguished from each other in commerce. *Mocha C.*, which comes from Arabia, and is known by its small gray beans inclining to greenish; *Java* or *East Indian C.*, which has large yellow beans; *Jamaica C.*, with beans somewhat smaller and greenish; *Surinam C.*, which has the largest beans; *Bourbon C.*, with beans pale yellow and almost whitish.

The employment of C. as a beverage was introduced from Arabia, in the 16th c., into Egypt and Constantinople. Leonhard Rauwolf, a German physician, was probably the first to make C. known in Europe, by the account of his travels printed in 1573. Soon after the first introduction of C., COFFEE-HOUSES arose almost everywhere. The first in Europe was established in Constantinople in 1551. In London, the first coffee-house was opened in Newman's court, Cornhill, in 1652, by a Greek named Pasquet. This Greek was the servant of an English merchant named Edwards, who brought some C. with him from Smyrna, and whose house, when the fact became known, was so thronged with friends and visitors to taste the new beverage, that to relieve himself from annoyance, Edwards established his servant in a coffee-house. The first coffee-house in France was opened at Marseilles in 1671, and in 1672 there was one opened in Paris, which soon had several competitors.

In Arabia and the east, C. is not usually prepared as a beverage in the same way as in Europe, except by Europeans. A decoction of the unroasted seeds is there generally drunk; and for the "sultan's coffee," the pericarp with the dried pulp roasted, is employed.

The great demand for C. has led to the employment of a number of cheaper substitutes, of which *chicory* (q.v.) root is the best known in this country. Of others, dandelion root, carrot, and the seeds of the common yellow iris may be mentioned. They are prepared by roasting like coffee. The seed of *astragalus boëticus*, already mentioned in the article ASTRAGALUS, are known on the continent of Europe as *Swedish C.*, and are

said to be the best substitute for C. yet discovered. But all these substitutes want the most important constituent of true C., *caffeine;* and are therefore very different from it in their qualities. C. is subject to great adulteration, most of the articles specified as substitutes being employed for this purpose. The chief substance of mixture, however, is chicory, the use of which for this purpose was legalized by a treasury minute in 1840. This adulteration was prohibited by a treasury minute of 1852; but it being found impossible to make the prohibition effectual, a minute was passed in the succeeding year, permitting the mixture and sale of C. and chicory, on condition that the parcels containing it were labeled in conspicuous letters, *mixture of coffee and chicory.*

The leaves of the C. tree are used in the western part of Sumatra instead of the seeds. They are prepared by quick drying in a manner similar to that in which tea-leaves are prepared; and in this state contain even a larger proportion of caffeine than the C. beans of our shops. It seems not improbable that the use of the C. leaf may yet extend very much.

C. owes its exhilarating and refreshing properties to the presence of three substances: 1. *Caffeine* (q.v.), which occurs in the roasted bean to the extent of ¾ to 1 per cent; 2. A *volatile oil,* which is not present in the raw bean, but is developed during the process of roasting to the extent of only one part in about 50,000 of the roasted C.; and 3. Astringent acids, resembling tannic acid, but called caffeo-tannic and caffeic acids. The average composition of unroasted C. is as follows:

Caffeine	0.8
Legumin (vegetable caseine), (q.v.)	13.0
Gum and sugar	15.5
Caffeo-tannic and caffeic acids	5.0
Fat and volatile oil	13.0
Woody fiber	34.0
Ash	6.7
Water	12.0
	100.0

When the beans are roasted till they assume a reddish-brown color, they lose 15 per cent by weight, and gain 30 per cent in bulk; when further roasted till they become chestnut-brown, they have lost 20 per cent by weight, and increased 50 per cent in bulk; whilst if the roasting is continued till the beans become dark-brown, they lose 25 per cent in weight, and acquire 50 per cent in bulk. The beans should never be darker than a light-brown color, which is quite sufficient to bring out the excellent aroma and other qualities of the C.; and when the roasting is carried further, more or less charring is the result, and a disagreeable burned smell is produced, which tends to overcome the natural pleasant aroma.

C. does not retard the action of the bowels, as strong infusions of tea tend to do, partly because there is less of the astringent principle, and also owing to the presence of the aromatic oil which tends to move the bowels. The important offices which C. fulfills are, to allay the sensation of hunger; to produce an exhilarating and refreshing effect; and, most important of all, to diminish the amount of wear and tear, or waste of the animal frame, which proceeds more or less at every moment. See NUTRITION. The grounds of C. are very nutritious, from containing so much legumin; and some of the eastern nations take advantage of this, and use the grounds as well as the infusion. In other respects, C. possesses similar properties to tea (q.v.).

An endless variety of apparatus have been contrived—some of them of great complexity—for preparing C. for the table. The chief object aimed at is, to obtain the liquor free from all sediment. One of the simplest and cheapest of these contrivances is the percolating coffee-pot. The easiest way of making C.—requiring no special apparatus, and as satisfactory in the result perhaps as any—is to put two ounces of (fresh-roasted and fresh-ground) C. into a small saucepan or common coffee-pot; pour over it a pint of boiling water, and allow it to stand, closely covered up, by the side of the fire (but *not* to boil) for five minutes. The liquor may then be simply poured off the grounds, or it may be strained through a cloth, and then returned to the saucepan or coffee-pot (previously rinsed out), and warmed again. Soyer recommends, that before the boiling water is poured in, the saucepan should be set dry on the fire, and the powder stirred till it is quite hot, but not in the least burned. In France, a pint of boiling milk is added to a pint of coffee. The chief effect of adding chicory to C. is to deepen the color.

ESSENCE OF COFFEE is a highly concentrated infusion, mixed to the consistence of treacle with extract of chicory and burned sugar, and kept in well-corked bottles. By pouring boiling water upon a tea-spoonful of the essence, a cup of very tolerable C. may be prepared in a moment.

The trade in C. is of great importance. The following statement is given in *M'Culloch's Commercial Dictionary* as "a pretty fair estimate" of the comparative exports of C. from the principal places where it is produced, and of the annual consumption in those countries into which it is imported from abroad:

EXPORTS.

	Tons.
Mocha, Hodeida, and other Arabian ports	8,000
Java	55,000
Sumatra and other parts of foreign India	8,000
Brazil and the Spanish main	160,000
Hayti	16,000
Cuba and Porto Rico	7,000
British West India colonies	2,000
India and Ceylon	38,000
Dutch West Indies	2,000
French West Indies and the Isle de Bourbon	2,500
	298,500

CONSUMPTION.

	Tons.
Great Britain	16,000
Netherlands and Holland	40,000
Germany, Russia, and countries round the Baltic	60,000
France, Spain, Italy, Turkey in Europe, the Levant, etc.	55,000
The United States	90,000
Canada, Australia, etc.	30,000
	291,000

In 1876, the total quantity imported into the United Kingdom was 1,341,378 cwts., of which 792,915 cwts. were imported from Ceylon and other British possessions, the computed real value being £6,412,782, or about 10*d.* per lb. The quantity retained for home consumption during this year was 297,699 cwts., on which a duty of 14*s.* per cwt. in the raw state, and 2*d.* per lb. in a kiln-dried, roasted, or ground condition, was leviable.

COFFEE, a co. in s.e. Alabama, watered by Pea river and its tributaries; original area, 900 sq.m.; pop. '80, 8,061—1284 colored. Surface hilly, and soil for the most part poor, with abundance of pine timber. Productions, agricultural. Co. seat, Elba.

COFFEE, a co. in s.w. Georgia, between the Ocmulgee and the Allapaha rivers, reached by the Macon and Brunswick, and the Brunswick and Albany railroads; 1000 sq.m.; pop.'80, 5,070—1042 colored. It has a level and sandy surface, producing corn, oats, rice, cotton, etc. Co. seat, Douglas.

COFFEE, a co. in central Tennessee, intersected by the McMinnville and Manchester railroad; 320 sq.m.; pop. '80, 12,894—1727 colored. Surface hilly, and soil fertile; producing wheat, corn, cotton, etc. Co. seat, Manchester.

COFFEE BUG, *Lecanium coffeæ*, an insect of the coccus (q.v.) family, which lives on the coffee-tree, and is often extremely destructive to coffee plantations. It has of late years devastated some of those in Ceylon. To check its ravages, the experiment was tried of introducing into the plantations the red ant (*formica smaragdina*), abundant in many of the gardens and jungles of the island, which feeds greedily on the C. B.; but the fierce assaults of the ants on the naked skins of the Malabar coolies, made them threaten to leave the estates.

COFFEE-TREE, KENTUCKY. See GYMNOCLADUS.

COFFER, in fortification, is one particular kind of *caponnière* (q.v.).

COFFER, a deep panel in a ceiling, also called a caisson.

COFFER, a casket for keeping jewels or other valuables. Caskets and chests were sometimes made of iron, but more frequently of wood.

COFFER-DAM, a water-tight structure used in engineering for excluding the water from the foundations of bridges, quay-walls, etc., so as to allow of their being built dry. Coffer-dams are generally formed of timber piles driven close together (called sheeting) in two or more rows, according to the depth of water and the nature of the bottom; the space between the rows, which may vary from four to ten feet, being spooned out, down to the solid and impervious bottom, and filled up with clay puddle. Sometimes they are made of only one row of piles of the full height, calked above low-water, with a low or dwarf row outside to confine the puddle up to that level, or, where there is no wave or current, with a mere bank of clay thrown against the outside; and occasionally the upper work is formed of horizontal planking, fixed on open main piles, and calked in the joints. When the bottom is rock, so as to prevent piles being driven, and is not much below low-water, coffer-dams are occasionally formed of two stone-walls, with a space between filled with clay.

The coffer-dams before spoken of are all what are called high-water dams, and exclude the water at all states of the tide. They require to be provided with sluices, to allow of the water, when first to be excluded, getting out during the ebb, and to shut against it during the flood. The remainder of the water, and all leakages, must be got rid of by pumps, generally worked by a steam-engine. For moderately shallow foundations, and

more especially where there is a great rise and fall of tide, tidal-dams are often used. These are sometimes made of sheeting piles, but are often boxes formed of planking or of iron, weighted and sunk into the ground by digging inside in the same way that wells are sunk. These dams can only be used for a couple of hours or thereabouts at low-water, and, of course, require to be pumped out every tide. All coffer-dams require to be strongly shored within, to prevent their being forced inwards by the pressure of the external water; and the rows of piles require to be strongly bolted together, to overcome the pressure of the clay puddle, which otherwise would burst them.

COFFEY, a co. in s.e. Kansas, intersected by the Neosho river, and traversed by the Missouri, Kansas, and Texas railroad. The business is almost exclusively agricultural. Co. seat, Burlington. Pop. '80, 11,438.

COFFIN (Lat. *cophinus*, Gr. *kofinos*, in both languages signifying a basket, coffer, or chest, but never a coffin). In the ordinary English sense of the word, a C. is a chest or box in which dead bodies are buried or deposited in vaults; but the term is also applied to a mold of paste for a pie, and, in printing, to the wooden frame which incloses the stone on which the form is imposed. In farriery, it signifies the hollow part of a horse's hoof. It is in the first of these significations alone that we shall consider it here.

It has been keenly disputed amongst scholars, whether it was more usual with the Greeks to bury their dead, or to burn them (see BURIAL); but both customs unquestionably prevailed, and coffins, in the modern sense, were consequently known in Greece. They were called by various names (*soroi*, *púeloi*, etc.), and composed of various materials, the most common being baked clay, or earthenware. Their forms also varied, sometimes resembling those which we use, sometimes consisting of a narrow triangular box, the undermost side of course being considerably broader than the others. In Rome, the ancient practice was to bury the dead, not to burn them; though under the empire, and previous to the recognition of Christianity, the latter custom became almost universal. The C. in Rome was called *arca* or *loculus*, and was frequently made of stone, sometimes of a peculiar kind of stone brought from Assos, in Troas, which was said to consume all the body except the teeth in forty days, and which, from this circumstance, was called sarcophagus—an eater of flesh. See SARCOPHAGUS. Many Roman stone-coffins have been found in this country. The simplest of all coffins was that used by the British Celts and other rude nations, consisting of unhewn stones set on their edges, so as to cover the sides and ends of the grave, one or more flat stones being then laid over the body to form a lid. To these succeeded stone-coffins, which were commonly used for persons of the higher classes in Saxon times, and throughout the whole of the middle ages.

From Bede, however, we learn that the Saxons occasionally employed wood: and the common people, both then and in the subsequent Norman and English eras, were simply wrapped in cloth, and so put into the ground. The same custom seems to have been followed with monks down to a comparatively recent period. Stone-coffins were generally of a single block, commonly tapering from the upper end. In the hollow for the reception of the body, there was generally a part peculiarly fitted for the head, and a hole in the bottom to allow of the juices of the decaying body to escape. These coffins, for the most part, were not buried very deeply in the earth, and were frequently placed so near the surface that the lids were visible, which, within a church, often formed part of the pavement. Sometimes they were even above the ground altogether, and thus became the originals of altar-tombs. These lids were often covered with elaborate sculpture, representing crosses and other ornaments. Leaden coffins were occasionally used in the middle ages, as those recently brought to light in the temple church in London testify, but the slight wooden cases now in common use appear to be of comparatively recent origin. See Strutt's *Manners and Customs*, and Gough's *Sepulchral Monuments*.

COFFIN, Sir ISAAC, 1759–1839; b. Mass.; went into the British naval service in 1773, and rose through all grades to admiral. In 1818, he was elected to parliament, where he remained until 1826. In the latter year, he founded a school in Nantucket, which is still called by his name; indeed, the name was once almost a common noun in that island, so numerous were the families that owned it.

COFFIN, JAMES HENRY, LL.D., 1806–73; b. Mass., and graduated from Amherst college in 1838; was professor in Williams college, and superintended the erection of the observatory on Greylock mountain. From 1846 until his death, he was professor of mathematics and astronomy in Lafayette college, at Easton, Penn. Among his publications are *Solar and Lunar Eclipses; A Discussion on the Meteoric Fire Ball;* and *Winds of the Northern Hemisphere.*

COFFIN, JOHN H. C., b. Maine, 1815; a graduate of Bowdoin college; in 1836, appointed professor of mathematics in the U. S. navy. In 1844, he was detailed to the naval observatory, and from 1866 has been in charge of the *American Ephemeris and Nautical Almanac.*

COGGESHALL, a t. in the n.e. of Essex, on the left bank of the Blackwater, 44 m. n.e. of London. It lies partly on low ground, near the river, and partly on some gentle ascents rising from it. There is an endowed grammar-school, founded by sir Robert

Hitcham. The church is one of the finest in Essex, and has been recently restored at great cost. It has manufactures of silks, velvets, and isinglass. Pop. '71, 2,916. It is supposed to have been the Roman *Canonium*, and the remains of a Roman villa have been found. It has the ruins of a Cistercian abbey, founded by king Stephen in 1142.

COGHETTI, FRANCESCO, b. 1804; an Italian painter who has executed many fine altar pieces in the churches of Bergamo and elsewhere. He painted for the villa Torlonia the exploits of Alexander the great. He is recognized as the head of a modern school who strive to restore the classical styles of painting.

COGNAC, a t. of France, in the department of Charente, with a pleasant situation on an old castle-crowned hill overlooking the river Charente. C. is celebrated as the place where the best brandy in France is manufactured, to which it gives its name. Not half the quantity of so-called *Cognac* brandy, however, is manufactured here. The cultivation of the vine and distillation of brandy form the chief industry of the inhabitants of the district. Francis I. was born here. Pop. '76, 13,811.

COGNATE. See AGNATE.

COGNIARD, THÉODORE, 1806–72; a dramatist of Paris, who, with his brother, Hippolyte, wrote a great number of fairy plays, vaudevilles, and other light pieces, which were unusually successful. Some of them are *La Biche aux Bois; Belle Hélene; Barbebleue; Perichole;* and the *Grande Duchesse.*

COGNI'TION AND SA'SINE, in Scotland, a form of entering an heir in burgage property. See CONVEYANCING.

COG'NIZANCE, a term used in a loose manner in heraldry, sometimes to signify a crest (q.v.), sometimes a badge (q.v.), or other distinguishing mark.

COGNO'MEN, equivalent to family name or surname. A Roman of any social position ordinarily had three names, the last being his C. and the name by which his family was known. In Marcus Tullius Cicero, the first name is the *præ-nomen,* the second the *nomen,* and the third denoted the family, or *gens.*

COGNOSCEN'TI (Ital., from Lat. *cognosco,* to know), persons professing a critical knowledge of works of art, and of a somewhat more pretentious character than amateurs.

COGNO'VIT, viz., *actionem* (he has confessed the action), in the law of England, is the defendant's written confession that the plaintiff's cause against him is just and true. A C. usually proceeds on the condition that defendant shall be allowed a certain time for the payment of the debt or damages and costs; and it impliedly authorizes the plaintiff's attorney to do everything necessary to obtain judgment.

COGSWELL, JOSEPH GREEN, LL.D., 1787–1871; b. Mass.; graduate of Harvard in 1806. He studied law with Fisher Ames, but did not continue its practice, preferring to be a tutor at Cambridge. In 1816, with George Ticknor and Edward Everett, he traveled in Europe, where he paid special attention to the methods and principles of instruction. In 1820, he was made professor of mineralogy and geology, and librarian of Harvard college. In 1823, with George Bancroft, he founded the Round Hill school at Northampton, Mass. About 1839, he settled in New York, where he was employed by John Jacob Astor, and became chief adviser of the millionaire in establishing the Astor library, one of the most valuable collections in the country. Under C.'s superintendence the library took form and grew up to completeness, and he remained its leading spirit as long as his health would permit, retiring from the superintendence in 1863.

COHABITA'TION, in the law of Scotland, means living at bed and board together, like man and wife, and being reputed to be such. These circumstances, when fully established, are held to afford sufficient proof that the contract of marriage between the parties has actually been constituted by their mutual consent.

COHASSET, a t. in Norfolk co., Mass., 15 m. s.e. of Boston, reached by the South Shore railroad; pop. '80, 2,182. The township borders on Massachusetts bay and on Plymouth county. Northward from C., the peninsula of Nantasket stretches towards Boston harbor. The people of C. are engaged chiefly in the fishing and coasting trade. The original Indian name, Conohasset, means "fishing promontory."

CO-HEIR' AND **CO-HEIR'ESS**, one of two or more persons, among whom an inheritance is divided. See HEIR, SUCCESSION.

COHE'SION is the name to given that species of attraction (q.v.) by which the particles of matter are held together so as to form bodies (see ADHESION), and its measure is the resistance which bodies offer to any mechanical force tending to separate their parts. In gaseous bodies, C. is altogether wanting; their atoms even repel one another. In liquids, notwithstanding the ease with which the particles slide on one another, the operation of C. is distinctly seen in the formation of drops. C. is strongest in solids; and degrees of C., in this case, are much the same thing as degrees of solidity. It is the force of C. that constitutes the strength of materials (q.v.). After the particles of a body have been completely separated, it is found that through C. they will reunite, if pressed sufficiently close together. Two clean, smooth, freshly cut pieces of lead placed together, will cohere so as to require a very considerable force to separate them; and it

has not unfrequently happened in plate-glass manufactories, that polished plates of glass have cohered so completely that they have been cut and worked as a single piece.

If the particles of matter had no property in relation to one another, except their mutual impenetrability, the universe, it has been said, would be like a mass of sand, without variety of state or form. As it exists, however, it demonstrates the cross-action of several universal properties of matter. Among those which most affect its state and form, are heat and cohesion. It may be said that bodies assume the solid, liquid, or aëriform states, just according to the proportion that the C. of their particles bears to those forces which, like heat, tend to separate them. See HEAT. Upon modifications of the cohesive force, and its relations to other molecular forces, would seem to depend such properties as elasticity, brittleness, ductility, etc.

COHESION-FIGURES, a remarkable class of figures produced in liquids by the action of their natural cohesive attraction for the surfaces of other liquids or solids on which they are deposited, or by induced cohesive attraction effected by the means of electricity. They may be described under four heads: (1) The surface-cohesion figures of Tomlinson; (2) The submersion-figures of Tomlinson; (3) The breath-cohesion figures of Strethill Wright; (4) The electric-cohesion figures of Strethill Wright.

1. *The Surface-cohesion Figures of Tomlinson.*—This class of figures was submitted to the chemical section of the British association by Mr. Charles Tomlinson of King's college, London, in 1861. He showed that a drop of an "independent liquid," such as an oil, alcohol, or ether, when gently placed upon chemically clean water, spreads itself out into a definite figure as it enters into solution or diffuses itself over the surface. He stated that each figure is characteristic of the fluid employed, and that any change in the chemical or molecular state of the fluid is attended with a corresponding change in its "cohesion-figure." Hence he recommended that these figures should be applied to the qualitative analysis of various liquids whose ordinary methods of testing were inoperative or inadequate. *Cohesion analysis*, performed as he directs, has been applied with signal success in the verification of oils and balsams, and as a ready means of indicating the changes which take place in those bodies by age or oxidation. The cohesion-figures of Tomlinson, from their great beauty and variety, combined with the exquisite harmony of coloring displayed by many of them, have been employed, like those of the kaleidoscope of Brewster, to suggest forms for the pattern-designer.

In the production of cohesion-figures, water was the receiving surface generally employed by their discoverer; but in certain cases he also employed other fluids, such as mercury, acetic acid, cocoanut-oil and castor-oil in the cold state; and spermaceti, white wax, lard, and sulphur in a state of fusion. On each of these substances, the liquid to be tested formed a different and characteristic figure, and hence additional means of comparison and verification were afforded.

2. *The Submersion-figures of Tomlinson.*—In the *Philosophical Magazine* for June, 1864, this author brought forward a new series of cohesion-figures of liquids, in which the drop, being of great specific gravity, instead of forming a figure on the surface, sank beneath it, and formed a figure as it slowly made its way to the bottom of the vessel. In order to exhibit these phenomena, he employed a column of liquid in a cylindrical vessel. He states that a solution of cochineal dropped into water formed a figure typical of a large class of these figures. A drop laid on the surface sank down, opened into a ring, which became depressed at two opposite points; from these points, lines of fluid descended, which terminated in secondary rings; the secondary rings, in like manner, drooped down into lines carrying tertiary rings, and so on, until the lower part of the vessel became crowded with a complicated system of drooping rings and lines. Oil of lavender in a column of alcohol, fusel oil in paraffin oil, in benzole, in ether, etc., gave various and distinctive figures. He found that similar figures were obtained by the use of oils dropped into columns of hot spermaceti, lard, wax, etc.; and that these figures underwent considerable variation under the influence of change of temperature. We have already stated that each of these figures, whether surface-figures or submersion-figures, is characteristic of the fluid which forms it; and Tomlinson considers, with regard to the *surface-figure*, that it is a function of the cohesive force and diffusibility of the liquid, and the adhesion of the surface on which it is deposited; he also considered that it might be a function of the solubility and the diffusibility of the fluid in question, or of the solubility, the density, and the molecular attraction; while with regard to the *submersion-figure*, he thought each figure to be a function of the solubility, the density, and the molecular attraction.

3. *The Breath-cohesion Figures of Strethill Wright.*—These figures were discovered by Dr. Strethill Wright of Edinburgh, and communicated to the royal Scottish society of arts on Dec. 12, 1864. This author, who had long been engaged in observing phenomena connected with the modification of cohesive attraction produced between solids and fluids by heat and electricity, was induced to take up the subject afresh by the publications of Tomlinson, and one of the results was the production of his so-called "breath-cohesion figures." He employed as the recipient surface a freshly-split, and therefore chemically clean, surface of mica; on this he placed a single drop of the fluid to be experimented on. He then breathed upon the surface, and instantly the drop flashed out into a figure characteristic of the fluid of which it was composed. By this means,

a variety of substances, such as vegetable extracts, tinctures, and essential oils, and animal fluids, such as serum, vaccine lymph, bile, mucus, and urine in its various pathological conditions, could be examined. By dusting the figures with hair-powder or lycopodium, he was also enabled to render them permanent, and to exhibit them in his lectures, expanded to a diameter of 14 ft. by the oxyhydrogen microscope. In general appearance, the breath-cohesion figures bear a strong resemblance to vegetable forms, especially to the fronds of the *desmidieæ*. In many of them, as in the *desmidieæ*, a very distinct bilateral symmetry is apparent. Others, again, simulate the forms of the larger *algæ*. A great many are resplendent with the hues of the soap-bubble, arranged in concentric bands and curves of excessive beauty; while others are veined throughout so as to resemble sections of agate. Dr. Wright considers that the breath-cohesion figure is the product of electric attractive force developed on the freshly-split mica, as a well-known consequence of cleavage.

4. *The Electric-cohesion Figures of Strethill Wright.*—These figures were described by Dr. Wright to the royal Scottish society of arts on April 11, 1864, and are produced by electrifying drops of various fluids placed on a clean plate of glass, vulcanite, mica, or other smooth non-conducting substance. By this method, an endless variety of beautiful dendritic figures are produced, differing not only with the fluid employed, but also with the slightest change in the character of the surface on which it is placed, and with the electricity, whether positive or negative, which is imparted to the drop. The electric-cohesion figures are produced in the following manner: A sheet of plate-glass is laid upon a plate of blackened metal, and in the center of the glass a drop of the fluid to be operated on is deposited with a clean glass rod. The metal plate and the drop are then connected with the opposite poles of an induction coil (capable of giving a spark of about half an inch in length) in full action, and immediately branches protrude from the drop, which slowly creep over the glass until they closely cover a circle of 4 or 5 inches. Sulphuric acid, and solutions of potash, deliquescent salts, and organic fluids, give the best figures; while nitric and muriatic acids and distilled water do not form figures under the electric influence.

COHOES', a city in Albany co., N. Y., at the junction of the Mohawk and Hudson rivers and the e. terminus of the Erie canal, at its junction with the Champlain canal; reached by the Rensselaer and Saratoga and the Troy and Schenectady railroads, and from Albany by horse-railroad; pop. '80, 19,417. The city is furnished with unlimited water-power by the Mohawk, which here has a fall of 70 feet. A dam above the falls holds back the water, which is supplied to the mills and factories by canals. There are immense cotton-mills, woolen-mills, knitting-mills, rolling-mills, axe-factories, pin-factories, and many other branches of manufacturing industry. There are many fine churches in the city.

CO'HORT, in the ancient Roman armies, was a portion of a legion, consisting usually of 600 men. Generally, there were ten cohorts to a legion (q.v.).

COHOSH', the Indian name of black snake-root. It is regarded as a stimulating tonic, tending to diminish the force and frequency of the pulse. It is used to a great extent as a specific for rheumatism and cholera.

COHUNE' OIL, a fixed oil obtained from the kernel of the fruit of *attalea cohune*, a palm (see ATTALEA), abundant in Honduras and the isthmus of Panama. The oil is said to be of the finest quality, and to burn twice as long as the best cocoa-nut oil. The tree attains a height of only about 40 ft., but its leaves are 30 ft. long, and each leaflet measures 3 feet. The sap is drawn off for palm-wine.

COIF (Fr. *coiffe*, Ital. *cuffia*, a cap), a covering for the head in general, but more especially for the circular portion on the crown, which the Roman Catholic clergy are in the habit of shaving, and which is thence called the tonsure. The general meaning of the word is preserved in the verb to coif, coiffed, etc., and still more decidedly in the noun *coiffure*, which, so late as Addison's time, was English as well as French. Its special signification is now limited to the caul or cap worn by serjeants-at-law. It is now the only reminiscence of the tonsure amongst lawyers. On attaining the DEGREES OF THE C., or, what is the same thing, becoming a serjeant, a barrister retires from the inn of court by which he was called to the bar, and becomes a member of serjeants' inn. See SERJEANT-AT-LAW.

COIF, among the armor of the middle ages, was a sort of defensive hood, surmounted by a helmet, sometimes continuous with the hauberk, and sometimes separate.

COIMBATORE', a city in the province of Madras, capital of a district of the same name, situated near the left bank of the Noyel, a tributary of the Cauvery from the right, in lat. 11° n., long. 77° 1′ east. It occupies the s. declivity of the Neilgherries, 1483 ft. above the sea, near the point where those otherwise isolated mountains connect themselves with the Western Ghauts. Almost immediately to the s. of the junction of the two chains, the remarkable depression of Palghatcheri traverses the Western Ghauts from e. to w., so as to afford a free passage for both the monsoons—the n.e. and the s.w.—in their respective seasons. C., which contains about 2,000 houses, from its proximity to this great gorge, is admirably ventilated during most of the year. This peculiarity, backed by the elevation, tends to promote the salubrity of the place, which,

however, is seriously impaired by the brackish character of the wells. In the neighborhood is a very large tank. Pop. '71, 35,310. C. is on the line of railway from Madras to the w. coast.

COIMBATORE, a district in the province of Madras, in lat. 10° 14′ to 12° 19′ n., and long. 76° 36′ to 78° 16′ e., containing 7,432 sq.m. and (1871) 1,763,274 inhabitants. Lying to the n.e. of the state of Cochin, it is almost entirely beyond the Western Ghauts. Besides the capital above described, there are in the district the towns of Palaghat and Darrampoor.

COIMBRA, a city of Portugal, capital of the province of Beira, situated on the right bank of the river Mondego, here crossed by a stone bridge, 110 m. n.n.e. of Lisbon. Built round a conical hill, rising abruptly from the river, and surrounded by olive-gardens and orange-groves, its appearance from a distance is as beautiful as it is picturesque. Interiorly, however, it is not so attractive, its streets being steep, narrow, and dirty. Great historical interest attaches to C., which appears to have been originally built by the Goths. From them it passed to the Moors, from whom it was finally conquered in 1064, by Fernando the great, aided by the gallant Cid. On the erection of Portugal into a kingdom, in 1139, C. was made the capital, and continued so about two centuries and a half. Of the public buildings, the most noteworthy are the cathedral, the churches of San Francisco and San Salvador, the convents of Santa Cruz and Santa Clara, and a fine aqueduct of 21 arches, dating from the 16th century. The university of C., the only one in Portugal, was originally established in 1290, but permanently transferred here in 1537. It has 46 chairs, and about 1000 students, many of the latter being Brazilians. Attached to the university are museums, an observatory, a botanical garden, and a library of 60,000 volumes. C. has manufactures of linen, woolen, earthenware, and combs. Pop. 13,200.

COIN (*ante*), money made of metal—in the United States, of gold, silver, nickel, and copper. In ante-revolutionary times, and before the adoption of the present constitution of the United States, the various colonies and states, so far as they found occasion, made their own coins, which afford interesting study for the numismatist. The coinage laws of the United States have undergone a variety of changes since 1792, when the first code was adopted. In 1873, an act was passed by congress consolidating the regulations governing the coinage of the country, in conformity with the advice of John Jay Knox, comptroller of the currency. Gold and silver, on account of their softness, require, when used for coins, to be hardened by alloy. The gold coins are made of metal consisting of 900 parts pure gold and 100 of alloy; the alloy being 1 part of silver and 9 of copper. Gold of this quality is called standard gold. Silver coins are hardened by the same proportion of copper. The gold dollar weighs 25.8 grs. of which gold 9.10 fine, 23.22 grs.; the quarter-eagle ($2.50), 64.5 grs.; the half-eagle ($5), 129 grs.; the eagle ($10), 258 grs.; and the double eagle ($20), 516 grs. The gold coins are a legal tender to any amount. The silver coins are the "trade dollar" (coined especially for use in China and Japan, containing 420 grs. of silver); the dollar, 412½ grs.; the half-dollar (50c.), 12½ grams, or 192.9 grs.; the quarter-dollar (25c.), the dime (10c.), the half-dime (5c.), each of proportionate weight according to its relative value. The silver coins are a legal tender to any amount not exceeding $5. The minor coins are composed of 95 per cent of copper and 5 per cent of tin and zinc. The five-cent nickel piece is 20 millimeters in diameter, and weighs 5 grams. The three-cent piece weighs 30 grs. the cent 48 grs. These are a legal tender for any amount not exceeding $5. Individual citizens are permitted to coin money, but this coin must not be in "resemblance or verisimilitude" to those made by the government.

COÍN, a t. of Andalusia, Spain, about 21 m. w. of Malaga. It is pleasantly situated on a declivity, with wide clean streets, and environed with fine public walks and gardens. It has manufactures of linen and woolen, soap, paper, etc., and in the vicinity, marble and jasper are obtained. Pop. 8,200.

COINCIDENCE. If, when two geometrical figures are laid upon one another, the boundaries of the one fall everywhere exactly upon those of the other, the figures are said to *coincide*. Such figures are considered as identical; and this C. is taken by Euclid as the test of equality, or rather, as the definition of equality. It is not necessary, in geometry, actually to lay the one figure upon the other; if we know the equality of certain parts, we can infer with certainty that the whole figures *would* coincide, if superimposed, and that the other parts are therefore equal too.

COIN—COINING. See MINT, NUMISMATICS, MONEY, CURRENCY.

COINING in law. The privilege of C. money being an exclusive prerogative of the crown, the crime of counterfeiting the king's money, as it was called, was declared to be treason, both by the common law of England and by many statutes. In Scotland, there continued to be some differences in regard to this crime, even after the union had extended the treason laws of England to that kingdom.

The whole of the legislation on this subject was at length repealed, and a general act passed for the whole kingdom (2 Will. IV. c. 34). By this statute it is enacted—1. That any one who shall fabricate a coin in imitation of a current *gold* or *silver* coin—or gild silver, or color any counterfeit gold or silver coin—or shall alter silver coin with intent

to make it pass for gold coin—or copper coin, to make it pass for gold or silver coin, shall be punishable with transportation for life, or for a term not less than 7 years, or with imprisonment for a term not exceeding 4 years. 2. That any one who shall impair, diminish, or lighten gold or silver coin, shall be punishable with transportation for 7 years, or imprisonment for 3 years. 3. That any one who shall buy, sell, receive, pay, or put off counterfeit gold or silver coin for a lower value than its denomination, or shall import counterfeit gold or silver coin, knowing it to be such, shall be punishable with transportation for life, or 7 years, or with imprisonment for not more than 4 years. 4. The uttering (q.v.) of base coin is punishable with imprisonment for a year. 5. By subsequent clauses, the possession of false money, with intent to utter the same; or of instruments for its fabrication; the conveying such instruments out of the mint without authority; the fabrication of copper coin, and the altering of current coin so as to make it pass for coin of a higher denomination, are declared to be offenses all of which are visited with punishments resembling those above mentioned.

In order to bring these offenses within the limits of the statute, it is not necessary that the resemblance of the false to the true coin shall be very perfect; but if it be not such as to deceive a person of ordinary observation, the attempt to bring it into circulation is fraud, and not uttering.

COIR, or Co'coa-nut Fi'ber, the fiber of the husk of the cocoa-nut, much used for making ropes, mats, etc. The husks are steeped in water, in pits, for six months, or even for a year, and then beaten with a stick till the fiber readily separates. C. is now well known as one of the best materials for cables, on account of its lightness, elasticity, and strength. C. ropes are produced in great quantity in the Laccadive islands. They are entirely made by the hand—chiefly by women—without the aid of machinery of any kind. The manufacture of cocoa-nut mats is now carried on to a considerable extent in Britain, the husks being imported for that purpose. This manufacture is one of the branches of industry in which children are employed in the industrial or ragged schools, and criminals in prison.

COIRE. See Chur, *ante*.

COIT, Thomas Winthrop, D.D., LL.D., b. Conn., 1803; a graduate of Yale; rector of St. Peter's (Episcopal) church, Salem, Mass., in 1827, and two years later of Christ church, Cambridge. In 1834, he was chosen president of Transylvania university; in 1854, he was elected professor of ecclesiastical history in Berkeley divinity school, Middletown, Conn. He has published *A Theological Common-place Book; The Bible and Apocrypha in Paragraphs and Parallelisms; Remarks on Mr. Norton's Statement of Reasons; Puritanism, a Churchman's Defense against its Aspersions; Lectures on the Early History of Christianity in England*, etc.

COIX. See Job's Tears.

COJUTEPEC', a t. of San Salvador, Central America. It is situated 15 m. to the e. of the city of San Salvador, destroyed by earthquake in 1854, and was the seat of government from that year until 1858. C. has a pop. of 15,000.—At the distance of a few leagues, a lake of the same name measures 12 m. in length by 5 m. in average breadth; and in windy weather it assumes a green hue, often casting on its shores vast quantities of dead fish.

COKE is the fuel generally used in locomotive engines, and is obtained by the heating of coal in ovens, or other arrangements where little air is admitted. Caking coal is most suitable for the manufacture of coke. The process is conducted either (1) in heaps or ridges, or (2) in ovens. The coking in heaps is called the Meiler method, and consists in placing the coal in round stacks, or in long ridges, occasionally to the length of 200 feet. During the building of the coal, wooden stakes are driven in, which are afterwards taken out, and lighted coal introduced at numerous places at the same time. As the coal becomes heated, much smoke and vapor are evolved, which mainly consist of tar, water, and coal-gas. Whenever the smoke ceases to be evolved, the process of coking is regarded as concluded, and the mound or ridge of red-hot cinder, or C., is covered over with fine coal-dust, which, excluding the air, extinguishes the combustion. At places where the operation of coking is conducted regularly on the large scale, it is customary to erect brick chimneys or columns, about the height of the proposed mound, and to build the coal round these, placing the larger masses in the center, the smaller pieces outside, and ultimately covering the whole with fine coal or dross.

A more economical plan of preparing C. is to introduce the coal into fire-brick ovens. The coal is introduced by the top, and being lighted, a little air is admitted by openings in front. Whenever the coal ceases to evolve smoky vapor, every opening is closed, and the oven is allowed to cool down for 12 to 24 hours. A door in front is then opened, and the C. being raked out whilst still hot, water is thrown upon it, to stop the combustion. Small coal may be used if it belongs to the caking kind; and a little water sprinkled over it, causes the caking operation to proceed more completely. The proportion of C. obtained from coal in Great Britain ranges from 54 to 73 per cent, so that in round numbers the better class of coal for this purpose loses a fourth of its

weight. At the same time, the coal increases in volume to the extent of about one fourth.

C. is a hard, brittle, porous solid, with a color varying from iron-gray to blackish-gray, and more or less of a metallic luster, and does not soil the fingers. It absorbs moisture from the air, sometimes to the extent of 30 per cent, and contains an amount of ash ranging from ½ up to 15 per cent. It gives off no smoke in burning, is of great value as a fuel, evolving a very large amount of heat, and is used, not only in locomotive and other furnaces, but also in the smelting of metallic ores.

COKE, Sir EDWARD, a distinguished English lawyer and judge, was b. at Mileham, in Norfolk, on the 1st of Feb., 1551–52. Educated at the free grammar-school of Norwich, and at Trinity college, Cambridge, he passed thence to Clifford's inn, and subsequently to the Inner Temple, to study law, and was called to the bar in April, 1578. His great ability, legal learning, and the tact he exhibited in the conduct of his cases, secured him an immense practice on the very threshold of his career. In 1586, he was appointed recorder of Norwich; in 1592, recorder of London, a position he resigned the same year for the solicitor-generalship. In the following year, he was elected member of parliament for the co. of Norfolk, and was chosen speaker of the house of commons. In 1594, he was made attorney-general, an office he continued to hold until 1606, when he was appointed chief-justice of the common pleas, the duties of which position he discharged in a manner that secured for him a great reputation. Upright and independent, with a high notion of the dignity and importance of his office, he did not, in an age of judicial sycophancy, hesitate to oppose any illegal encroachment by royalty. The court thought to win him over by making him, in 1613, chief-justice of the king's bench. But here he proved equally incorrigible, maintaining, among other things, that the king had no power to stay the proceedings in a court of justice, even when his craven-hearted colleagues begged the royal pedant's pardon on their knees for ever having entertained such an opinion. This was too much: C., in a few months (Nov., 1616), was relieved from his chief-justiceship; but in no long time after, the royal favor was in some measure again extended to him. His support of liberal measures in parliament, however, soon brought him into trouble with the court-party, and in 1621–22, he suffered seven months' imprisonment in the Tower. In the third parliament of Charles I. (1628), C. took an active part in framing the celebrated bill of rights, and it was in a great measure owing to his advocacy that the lords were induced to agree to it. C. died 3d Sept., 1633. He is now best known for his law treatise, *Coke upon Littleton, or the First Institute*, a work which is still the standard one on all questions of constitutional and municipal law in England. His other works are the *Second, Third*, and *Fourth Institutes; The Complete Copyholder;* and *Reading on Fines;* while his collection of law reports, which made an epoch in the history of law on their appearance, are still of great value for the profession.

COKE, THOMAS, D.D., LL.D., 1747–1814; b. Wales; first bishop of the Methodist Episcopal church. He was educated at Oxford, and entered the ministry of the established church about 1775; but objections were made to his sermons as too evangelical, and he was silenced. After an interview with Wesley he joined the new denomination and was sent to London, where he became popular. In 1782, he was appointed president of the Irish conference, and in 1784, he was made bishop of America, reaching New York in the same year. Francis Asbury acknowledged his authority, and was by him ordained a bishop. They traveled together among the various conferences until the middle of 1785, when Coke returned to England, and visited Scotland, Wales, and Ireland. He made another visit to America, and afterwards devoted himself to missionary work, his first efforts being among the negroes in the West Indies. Again he traveled in a portion of the United States, and returned to England in 1787. The next year he again visited the West Indies and the United States, and again in 1790. After Wesley's death he was chosen secretary of the general conference. The remainder of his days were passed in active missionary work in Europe and America, and in 1813 he sailed for Ceylon, dying on the voyage. He wrote a life of Wesley, a commentary on the Scriptures, *History of the West Indies; History of the Bible; Defense of the Doctrine of Justification by Faith and the Witness of the Holy Spirit*, and many essays.

COL (Fr. *neck*), in geography, is a depression or pass in a mountain-range. In those parts of the Alps where the French language prevails, the passes are usually named cols —as the Col de Balme, the Col du Géant, etc.

COʹLA NUT, or KOLA NUT, the seed—not properly a nut—of *cola acuminata* or *sterculia acuminata*, a tree of the natural order *sterculiaceæ*, a native of the tropical parts of the western coast of Africa, and cultivated in other tropical countries. There are two varieties of the tree—one with broad, and the other with narrow leaves. The natives of Guinea value the seeds very highly, believing that to take a portion of one of them before their meals, improves the flavor of whatever they may eat or drink. When sucked or chewed, cola nuts are generally asserted to render the flavor even of very putrid water agreeable; but see foot-note under TEA. They are said to possess properties analogous to Peruvian bark. They are of the size of a pigeon's egg, of a brownish color, and bitter taste. They are mentioned by almost all travelers in w. Africa.

COL' AR'CO, in music, with the bow, in contradistinction to *pizzicato*.

COL'BERG, or KOLBERG, a fortified seaport of Prussia, in the province of Pomerania, on the Persante, near its mouth in the Baltic, in lat. 54° 9′ n., long. 15° 34′ east. It stands on a hill, surrounded with swamps, which can be readily laid under water, and is chiefly remarkable for the protracted sieges which it has undergone. In 1102, duke Boleslaus of Poland besieged it in vain. It endured long sieges in the thirty years' war, and in the seven years' war, and again in 1807, when it was most gallantly defended against the French. C. has manufactures of woolen, salt, and spirits; and salmon and lamprey fisheries. Pop. '75, 13,550.

COLBERT, a co. in n.w. Alabama, on the Genessee river, intersected by the Memphis and Charleston railroad; pop. '80, 16,154—6,949 colored. The productions are wheat, corn, oats, cotton, etc. Co. seat, Tuscumbia.

COLBERT, JEAN BAPTISTE, minister of finance to Louis XIV., was b. at Rheims in 1619, and served his apprenticeship in a woolen-draper's shop. He afterwards went to Paris, where his talents introduced him to Mazarin, who soon employed him in most important affairs of state. On his death-bed, Mazarin warmly recommended C. to the king, who, in 1661, appointed him comptroller-general of finances. C., who found the finances in a ruinous condition, immediately began his reforms. Fouquet, the superintendent under Mazarin, was found guilty of impoverishing the state by his maladministration, and imprisoned for life. C. next instituted a council of finance and a chamber of justice, to call to account the farmers of the state-revenues, who were forced to yield up all the resources of the crown of which they had fraudulently possessed themselves. The debts of the state C. also reduced by arbitrary composition. So complete and thorough was the change which C. effected, that in 20 years the annual revenue had risen to 116 million livres, of which 23 were spent in collection and administration; whereas, when the management of the finances was intrusted to him, the revenue amounted only to 84 million livres, and 52 millions were absorbed in its collection. C. did not rest satisfied with being a monetary reformer, but in various ways developed the industrial activity of the nation by state support. Commerce was extended, roads and canals—including that of Languedoc—were made. He organized anew the colonies in Canada, Martinique, and St. Domingo, and founded others at Cayenne and Madagascar. Made minister of marine in 1659, he found France with a few old rotten ships; three years later, she had a fleet of 60 ships of the line, and 40 frigates. C. improved the civil code, introduced a marine code of laws, as well as the so-called *Code Noir* for the colonies; and statistical tables of the population were first made out by his orders. While attending to material interests, he did not neglect the arts and sciences; all men of learning and genius found in C. a generous patron. The academies of inscriptions, science, and architecture were founded by him. In short, C. was the patron of industry, commerce, art, science, and literature—the founder of a new epoch in France. Notwithstanding the ingenuity of C., the unbounded extravagance of his master led him to raise money in ways objectionable to his reason, and to maintain war-taxes in time of peace. He died 6th Sept., 1683, bitterly disappointed, because his great services were but ill appreciated by the king. The people, enraged at the oppressive taxes, would have torn C.'s dead body in pieces, but for the intervention of the military, and his burial by night. Because he had brains without birth, he was vexed and persecuted, both in private and public life, by those who, having birth, lacked brains.

COLBERT, JEAN BAPTISTE, 1651–90; son of the French minister of finance. He succeeded his father as the head of the navy, and by his energy raised that branch of public defense to its highest efficiency. In 1684, he personally led a naval expedition against Genoa.

COLBURN, WARREN, 1793–1833; b. Mass.; a graduate of Harvard in 1816, and teacher of a select school in Boston. His taste turned to mathematics, and in 1821 he published *First Lessons in Arithmetic*, the sale of which far exceeded that of any previous mathematical work. It was translated into nearly all the languages of Europe and into some of those of India. From teaching he went into manufacturing, and was superintendent of large operations in Waltham and Lowell; but much of his time was devoted to lecturing on scientific subjects. In 1827, he became a member of the American academy of sciences, and was for several years one of the Harvard examining committee.

COLBURN, ZERAH, 1804–40; b. Vt.; wonderful for natural gifts in mathematics. At six years of age, he was brought before the public in exhibitions, and his performances excited great interest. There seemed to be no limit to his analytical capacity. He answered almost on the instant such questions as: How many seconds in 11 years? What is the square of 999,999? and many more difficult. He was taken to England for exhibition; but the father returned in poverty, leaving Zerah at Westminster school, where he remained until 1819. The father then desired him to become an actor, and he took lessons from Charles Kemble. Failing in this, he taught school. On his father's death he returned and taught in various places. In 1825, he joined the Methodist church, and became an itinerant preacher, and in 1835, was appointed pro-

fessor of languages in Norwich university. It is stated in his autobiography that the remarkable talent for mathematical work left him about the time he came of age.

COLBY, THOMAS, 1784–1852; an English engineer engaged in the trigonometrical survey of that country. He was a leading worker in other surveys, especially in Ireland, and became superintendent of that branch of public service. The invention of the "compensation bar" (a rod of brass and iron, the ends of which are always at the same distance without regard to temperature) is attributed to him; and he made great improvements in maps and charts.

COLBY UNIVERSITY, incorporated by the legislature of Massachusetts in 1813 as "The Maine Literary and Theological Institution." It was established in Bangor, but in 1818 it was transferred to Waterville, on the Kennebec river, 18 m. above Augusta, and two years later received from the legislature of the new state of Maine the name of "Waterville college." In 1867, when the college received a large endowment from Gardner Colby of Massachusetts, the name was changed to the one now used. Besides an endowment of $230,000, there is a recent bequest of $120,000 from Mr. Colby. Its annual income is about $20,000. The college is under the control of the Baptists. At the last report, Henry E. Robins, D.D., was the president; there were 8 instructors, and 157 pupils. The alumni number over 600. Women are admitted to the classes. The course is the usual college course of four years. The library has 14,500 volumes. The Waterville classical institute, controlled by the managers of the university, has the place of a preparatory department.

COLCHAGUA, a province in Chili between the ocean and the Andes, 3,516 sq.m.; pop. '75, 146,889. The climate is good and the soil fertile. There are gold and copper in the mountains. Chief town, San Fernando.

COLCHESTER, a co. in Nova Scotia around the upper part of Mines channel and Cobequid bay; 1300 sq.m.; pop. '71, 23,331. There are mines of gypsum and coal, and limestone is plentiful. The chief occupations are agriculture, lumbering, and shipbuilding. Chief town, Truro.

COL'CHESTER, a parliamentary and municipal burgh and river port, in the n.e. of Essex, on the s. bank of the Colne, 12 m. from the sea, and 51 m. n.e. of London. It stands on the sides and top of an eminence, and is well built. It has a quay for vessels of 150 tons at the suburb called Hythe. Its former manufactures of baize and silk have both declined. The important oyster fishery has suffered of late. Pop. '71, 26,343. C. returns two members to parliament. In 1875, 843 vessels of 45,600 tons entered, and 518 of 22,451 cleared the port. C. is the British *Camulodunum* and the Roman *Colonia*. The town walls, castle, and many churches and other buildings, consist of Roman brick. Great quantities of Roman remains have been found here, bushels of coins of many emperors, vases, urns, lamps, rings, bracelets, pavements, pateræ. C. was ravaged by the plague in 1348, 1360, and 1665. The ruins of the castle, built of cement-stone and Roman brick soon after the conquest, have walls 11 to 30 ft. thick. There are the ruins of an abbey, founded by Eudo the "Dapifer," and the remains of a priory.

COLCHESTER, CHARLES ABBOT, Lord, a distinguished legal and administrative reformer, was born at Abingdon, Berkshire, Oct., 1757. He was educated at Westminster school, and Christ's Church college, Oxford, and afterwards studied for the bar. Returned to parliament in 1795, he, in the very next year, succeeded in effecting an improvement in the legislation regarding temporary and expiring laws; and it is due to his exertions that municipal bodies receive a copy of all new acts as soon as they are printed. The country is mainly indebted to him for the royal record commission, the proceedings of which he for many years superintended. But the greatest service he rendered the country was in obtaining an act for taking the census of the population, the first enumeration under public authority in modern times. It was on his suggestion, too, that the private bill office, which has done much to facilitate parliamentary business, was established. In 1802, he was elected speaker of the house of commons, the duties of which high and honorable office he continued to discharge with as much impartiality as distinction, until May, 1817, when ill health compelled him to resign. He was then elevated to the peerage as baron Colchester, with a pension of £4,000 a year. He died May 29, 1829.

COL'CHICUM, a genus of plants of the natural order *melanthaceæ*. The species, which are few in number, are stemless, with flowers half subterranean like the crocus, the limb of the perianth and part of tube only rising above-ground. The flowers much resemble crocus-flowers, but are readily distinguished by having six instead of three stamens, and three styles instead of one. The seed vessel does not remain to ripen under-ground, as in the crocus, but after the flowering is over, rises in the form of three little follicles slightly adhering to each other, on a lengthened stalk. The only British species is *C. autumnale*, the MEADOW SAFFRON, sometimes also, but incorrectly, named *autumo crocus*, which is plentiful in meadows and pastures in some parts of England and of the continent of Europe. It scarcely occurs as a native plant in Scotland. The flowers are pale purple; they appear in autumn, unaccompanied by any leaves; the leaves, which are large and broadly lanceolate, appear in spring, when the stalk

which bears the ripening fruit rises amongst them. The whole plant is very acrid and poisonous, chiefly owing to the presence of an alkaloid called *colchicine* or *colchicia*. Cattle are not unfrequently injured by it in pastures where it abounds. It is, however, not difficult to extirpate, the repeated pulling of it by the hand, as it appears above-ground, being sufficient for this purpose; the roots soon become exhausted, and die. It is a valuable medicinal plant, and is much administered, in small doses, to allay the pain of gout and rheumatism. Repeated doses produce vomiting, purging, increase of the urinary secretion, and profuse perspiration. C. is generally supposed to have been the basis of the *eau medicinale*, long a celebrated empiric remedy for gout. The parts chiefly used for medicinal purposes are the corm (popularly called the root) and the seeds. The seeds are round, brown, and rather larger than mustard-seed; and fatal accidents have occurred from their poisonous nature.—Other species of C. appear to possess similar properties. The *hermodactyls* of the druggists' shops, which for many centuries have enjoyed an extensive celebrity for soothing pains in the joints, and are brought from the Levant, are believed to be the corms either of *C. variegatum* or *C. bulbocodioides;* the former of which is probably the C. of the ancients.—*C. autumnale* is not unfrequent in flower-borders, particularly a variety with double flowers.

COL'CHIS, a province of ancient Asia, on the e. coast of the Pontus Euxinus or Black sea, situated n. of Armenia, and s. of the Caucasus. It now forms the Russian province of Imerethia, with the districts of Mingrelia and Guria. It was celebrated in the very earliest times as the native country of Medea (q.v.), and the goal of the Argonauts (q.v.), and was afterwards better known to the Greeks as the seat of some colonies of the Milesians. It was noted for its wine and fruits. The Colchians, according to Herodotus, were of Egyptian descent, being relics of the army of Sesostris, which he attempts to prove by various arguments. In the time of this historian they were subject to Persia; subsequently, they threw off their allegiance, and were ruled by kings of their own; the country then came under the dominion of Mithridates, king of Pontus; afterwards, there were princes of C. dependent on the Romans. The principal town was Dioscurias (called under the Romans Sebastopolis), and now Isgaur; the principal river the Phasis.

COLD is the term by which we signify a relative want of sensible heat. There are, therefore, no determinate boundaries between cold and heat, and it is a mere arbitrary distinction to call the degrees of the thermometer below the freezing-point, degrees of cold. When the atmosphere, or any substance which comes in contact with our body, contains less heat than the body, it absorbs heat from the body, and we call it cold. See HEAT.

The physiological action of C. on the animal organism requires a brief notice. All animals (the warm-blooded animals to the greatest extent) have a certain power of maintaining the heat of the body, in defiance of external cold, as has been shown in the article ANIMAL HEAT. This power is mainly due to a process analogous to combustion, in which carbon and hydrogen taken into the system in food, are made to unite with oxygen derived from the air by respiration. If the combustible materials are not duly furnished, or if the supply of oxygen be deficient (as in various diseased conditions), there must be a depression of temperature. Now, if the temperature of a bird or mammal (except in the case of hibernating animals) be lowered about 30° below its normal standard (which in birds ranges from 108° to 112°, and in mammals from 98° to 102°), the death of the animal is the result. The symptoms indicating that an animal or a man is suffering from a depression of the temperature of the body, are, retardation of the circulation of the blood, causing lividity of the skin, which is followed by pallor, in consequence of the blood being almost entirely driven from the surface, through the contraction of the vessels; a peculiar torpor of the muscular and nervous systems at the same time manifests itself in an indisposition to make any effort or exertion, and in intense sleepiness. The respiratory movements become slower, for physiological reasons, which will be explained in the article RESPIRATION, and the loss of heat goes on, therefore, with increasing rapidity, till the fatal limit is reached, and death supervenes.

In hibernating animals (the marmot, dormouse, bat, etc.), the power of generating heat within their own bodies is very slight, their temperature following that of the external air, so that it may be brought down nearly to the freezing-point. At this low temperature, the vital actions are scarcely perceptible, but when the temperature is again raised, the vital activity returns. The respirations (in marmots) fall from 500 to 14 in the hour, and are performed without any apparent movement of the walls of the chest; the pulse sinks from 150 to 15 beats in the minute; and the animals can with difficulty be aroused from their torpor.—For additional matter bearing upon this subject, see the articles HIBERNATION, STARVATION, and DORMANT VITALITY.

C. is one of the most powerful depressing agents, and is a fruitful cause of disease, and even of death. Thus, it is observed, that whenever the temperature of the atmosphere is suddenly reduced, and particularly when it is reduced below the freezing-point, a considerable addition takes place to the mortality of the country at large. The effects of C. are, in ordinary circumstances, most apparent among the aged and the very young, and among those suffering from chronic disease; but when a very low tempera-

ture is long continued, even the healthy are sure to suffer, when impoverished so as not to have sufficient means of external warmth in their homes. The most direct effects of C. are in the production of what is commonly called frost-bite. The part so affected is deprived of circulation, and does not bleed on being wounded; it is marble-white or livid, and has lost all sensibility; and if the exposure is continued, or reaction is brought about too rapidly, it is apt to pass into gangrene. The extremities, especially the fingers and toes, and the tip of the nose, are the parts most liable to frost-bite. The remedy is exceedingly gradual restoration of the temperature, with gentle friction. In Russia, friction with snow is commonly resorted to, so as to secure against too rapid reaction. The effects of C. upon the general system are described by arctic voyagers, and a medical detail of them may be found in baron Larrey's interesting account of Napoleon's disastrous campaign in Russia. The circulation is much depressed; diarrhœa and rheumatic pains are frequent; in the end, the general sensibility becomes impaired, and an irresistible tendency to lie down is experienced, with excessive drowsiness. If this be not resisted, death is certain. The disease commonly termed "a cold" has been already described under CATARRH.

COLD. See CATARRH, *ante*.

COLD CREAM is the term applied to a preparation of fatty substances, which is used as a mild and cooling dressing for the skin. It may be prepared by heating gently four parts of olive-oil, and one part of white wax, till a uniform liquid mass is obtained, when a little color and scent may be added; the mixture is then allowed to cool, but must be stirred the whole time, so as to prevent the concretion and consequent separation of the wax. Another variety is prepared with the addition of hogs' lard, but the latter sometimes contains common salt, and is liable to become more or less rancid. C. C. softens the skin, and tends to promote the healing of wounds and of chapped hands.

COL DE LA SEIGNE, a pass in the Alps leading from the Val d'Aosta in Piedmont into Savoy, 7 m. w.s.w. of Mont Blanc. The crown of the pass is 8,472 ft. above tide.

COLDEN, CADWALLADER, 1688–1776; a native of Scotland who came to America in 1708 and practiced with great success as a physician in Philadelphia. In 1718, he settled in New York city. He was the first surveyor-general of the colony, a member of the provincial council, and in 1761 was appointed lieutenant-governor, holding the office until his death, which took place on Long Island five weeks after the British took possession of New York city. As the governors were often changed, C. was the real executive of the colony for 15 years. He published a number of works, of which the most important is his *History of the Five Indian Nations of Canada*, a work of great value. One of his favorite studies was botany, in the pursuit of which he sent many hundred plants to Linnæus, who published descriptions of them.

COLDEN, CADWALLADER DAVID, 1769–1834; grandson of Cadwallader. He was bred to the law, and became one of the most eminent of the New York bar. In the war of 1812, he was a colonel of volunteers. In 1818, he was chosen to the state assembly, and in the same year was appointed mayor of New York. He was chosen to congress in 1822, and to the state senate in 1824. C. was one of Clinton's best supporters in the work of internal improvements; and he was conspicuous in the cause of public education, the reformation of juvenile offenders, and other moral and social reforms. He wrote the life of Robert Fulton, and a memoir on the opening of the New York canals.

COLD HARBOR, BATTLES OF. See CHICKAHOMINY.

COLD PIT, or COLD FRAME, in gardening, is a simple contrivance for the preservation of half-hardy plants throughout winter, and consists of a pit, seldom more than 3 ft. in depth, and often not so much, walled or unwalled, and covered with a frame, either thatched or glazed.

COLD SPRING, a village in Putnam co., N. Y., on the Hudson river and the Hudson river railroad, 53 m. n. of New York. The place is noted for the manufacture of cannon, brass castings, and machinery.

COLDSTREAM, a border t. in the s. of Berwickshire, on the left bank of the Tweed, 15 m. s.w. of Berwick, and on one of the main routes from Scotland to England. It is irregularly built on a high site. Pop. '71, 1724. Near C. is the famous ford of the Tweed, where the Scotch and English crossed in former times, before the erection of Berwick bridge. By this ford Edward I. entered Scotland in 1296, and near it he met the Scottish nobles, to settle the disputes of Bruce and Baliol about the crown of Scotland. By this ford also the Scottish army entered England in 1640. Here gen. Monk, 1659–60, raised the regiment still known as the Coldstream guards (q.v.). Being a border town, C., like Gretna Green, was formerly celebrated for its clandestine marriages.

COLDSTREAM GUARDS, a regiment in the foot guards (q.v.) or household brigade, is the oldest corps in the British army except the 1st foot. Gen. Monk, in 1660, raised a corps at Coldstream, which was at first called "Monk's regiment;" but when parliament consented to give a brigade of guards to Charles II., this corps, under the name of C. G., was included in it.

COLDWATER, a city in Branch co., Mich., on the Coldwater river and Lake Shore and Michigan Southern railroad, 115 m. w.s.w. of Detroit; pop. '70, 4,381. It is the center of an important local trade.

COLE, a co. in central Missouri, on the Missouri river, bounded s.e. by the Osage, intersected by the Pacific railroad of Missouri; 410 sq.m.; pop. '80, 15,519—1871 colored. The soil is generally fertile, producing wheat, corn, oats, etc. Co. seat, Jefferson City, the state capital.

COLE, THOMAS, 1801–48; b. England; came to the United States in 1819. Having a taste for painting, he persevered, without teachers, money, or encouragement, until 1825 before obtaining general recognition. In that year he set up a studio in New York in the garret of his father's house. He began to paint scenes from nature, going to the Catskills for the purpose, and very soon secured the public appreciation for which he had labored. Thenceforth his career was prosperous. He visited the White mountains and Niagara, and in 1829 went to Europe, furnishing pictures for various exhibitions. After visiting Florence, Rome, and other art centers, he returned to New York in 1832. Receiving an order to furnish a private gallery with his pictures only, he produced his "Course of Empire," five paintings which he intended to be an illustration of the history of the human race. These works are now in the gallery of the New York historical society. In later years Cole produced "Departure" and "Return," the "Dream of Arcadia," and the "Voyage of Life." The latter, an allegory in four pictures, was one of his most popular works, and elicited praise from Thorwaldsen, with whom Cole became intimate on a second voyage to Rome in 1841. He returned in the same year. Among his many works, besides these mentioned, are: a picture of Mt. Etna, views in the White mountains, and on Lake Winnipiseogee, the "Angel Appearing to the Shepherds," "L'Allegro," "Il Penseroso," "Home in the Woods," "Hunter's Return," "Mountain Ford," "The Cross and the World," etc.

COLE'BROOKE, HENRY THOMAS, an eminent orientalist, was b. in 1765. He early went out to India, where, having served in various civil capacities under the East India company, he was appointed Sanscrit professor in the newly founded college at Fort William. Afterwards he became a judge at Mirzapore, and subsequently held the appointment of president of the board of revenue. During his residence in India, he had gained an extensive knowledge of the literature of the Vedas and their commentators, as well as of the writings of ancient Hindu grammarians, metaphysicians, and mathematicians. A sound critical judgment marks all his writings. He was a director of the Bengal Asiatic society; and many of the most valuable essays in the *Asiatic Researches* were contributed by him. These, with other papers, were afterwards republished as *Miscellaneous Essays*, in 2 vols., 1837. He also made translations from the Sanscrit works on Hindu law, algebra, arithmetic, and mensuration, which were important contributions to the history of mathematics. Among his other publications are a Sanscrit dictionary and grammar, and treatises on the philosophy and sacred books of the Hindus. He died in London (where he had for some years been president of the Asiatic society), Mar. 10, 1837.

COLEMAN, a co. in w. Texas, on the affluents of the Colorado; 1000 sq.m.; pop. '80, 3,603. The region is adapted to cattle-raising. Co. seat, Camp Colorado.

COLEMAN, LYMAN, D.D., b. Conn., 1796. He traveled and studied in Europe, and has been connected with several literary institutions in the United States. In 1873, he was professor in Lafayette college. He has published *Antiquities of the Christian Church; Ancient Christianity; Historical Text-book and Atlas of Biblical Geography; Prelacy and Ritualism*, and other works.

COLENSO, JOHN WILLIAM, D.D., b. England, 1814; educated at Cambridge, and was fellow and assistant tutor in St. John's college. In 1854, he was appointed first bishop of Natal, South Africa. He published a number of books on mathematics, *Village Sermons, etc.;* but the first of his works that attracted especial attention was *A Translation of the Epistle to the Romans, Commented on from a Missionary Point of View*, issued in 1861. This was followed in 1862 by *The Pentateuch and Book of Joshua Critically Examined*, in which the authorship of Moses and the accuracy of many statements in the books were questioned. An attempt was made to depose the writer by his superior, the bishop of Cape Town, but the deposition was declared void by the privy council. The local bishops then stopped his income, but the court of chancery ordered it to be paid, with arrears and interest. In recent years, Colenso has published *Natal Sermons*, a Zulu grammar, dictionary, and New Testament, and other educational books in that language. His later works are *The New Bible Commentary by the Bishops and Other Clergy of the Anglican Church, Critically Examined*, and *Lectures on the Pentateuch and the Moabite Stone.*

COLENSO. See NATAL, BISHOP OF.

COLEOP'TERA, or COLEOP'TEROUS INSECTS (Gr. *koleos*, a sheath; and *pteron*, a wing), an order of insects which, with a little change of limits and characters, has been recognized since the days of Aristotle. The number of species enumerated by naturalists, and of which examples are gathered in museums, amounts to many thousands. The C. are sometimes collectively called *beetles*, although that name is gen-

erally more limited in its application, and many of them are known by other names, as weevils, lady-bugs, etc. The glow-worm and the blistering-fly (*cantharis*) belong to this order.

The C. may be described as four-winged insects, which have the first pair of wings converted into crustaceous wing-cases (*elytra*), and the second pair of wings folded crosswise under these when not in use. In some of them, the membranaceous wings are wanting, or rudimentary, in one or in both sexes, for there is often a difference of the sexes in this respect: more rarely, the elytra also are wanting in one sex, as in the female glow-worm. The head and antennæ vary extremely in different C., the antennæ often differ considerably in the male and female of the same species. The first segment of the thorax (*prothorax*) is greatly larger than the other two. The abdomen is united to the thorax by its whole width, and not by a stalk. C. have two composite eyes, and no additional simple or stemmatic eyes (*ocelli*). The mouth is fitted for cutting, gnawing, tearing, or chewing, but never at all for suction, and exhibits in the greatest perfection of development the complicated structure which belongs to the mouth of all the *masticating* or *mandibulated* insects. See INSECTS. The upper jaws or *mandibles* are hard and horny in most of the C., but comparatively soft in those which feed on vegetable juices, or on putrescent animal matter. The food of the C. is very various: some prey on other insects, worms, etc.; some feed on carrion; some on rotten wood—some on wood in a fresh and growing state—some on the roots of grasses and other plants—some on grain—some on leaves—some on flowers, etc. The food of their larvæ is equally various; but perfect insects and larvæ generally agree in being very voracious. Their digestive organs exhibit great diversities, according to the kinds of their food. The C. are among the insects which undergo complete transformations, and of which the pupa is inactive. The larva (grub) is generally like a short thick worm, with a scaly head and mouth, generally with six legs, of which, however, some species are destitute. Coleopterous insects are distributed over all parts of the world, but are most abundant within the tropics, where also they attain their greatest size and greatest brilliancy of colors. The splendor of the metallic tints exhibited by many of the tropical species is not excelled in nature. The order, however, contains also many species of dull hue, and sufficiently unattractive appearance. Many of the C. are noted for the mischief which they do to crops, stores of provisions, timber, and articles of furniture, trees, etc.; few of them are of any immediate use to man, the principal of these being the blistering-flies or cantharides.

COLERAINE', a parliamentary and municipal borough and seaport, in the co. of Londonderry, Ireland. It is situated chiefly on the right bank of the Bann, 4 m. from the sea, and 47 m. n.n w. of Belfast, with which it is connected by railway. It consists of a central square and several diverging streets. C. has manufactures of fine linens, leather, paper, and soap, and a large salmon and eel fishery, which produces a rent of nearly £5,000. The river Bann has recently been deepened, so that, since 1873, larger vessels reach the quay at Coleraine. In 1875, 437 vessels, of 51,000 tons burden, entered the port, and 279, of 38,720 tons, cleared. The revenue of the borough was, in 1875, £2,463; its debt, £13,109. The population, in 1871, was 6,082, of whom 1329 were Roman Catholics, 2,090 Protestant Episcopalians, and 2,124 Presbyterians. C. returns one member to parliament.

COLERIDGE, HARTLEY, the eldest son of Samuel Taylor Coleridge, was b. at Clevedon, near Bristol, on the 19th Sept., 1796. In 1815, C. was entered a scholar of Merton college, Oxford. At the university, he became the slave of intemperate habits, and after obtaining the Oriel fellowship in 1818, he was judged to have forfeited it by the authorities. He then went to London, wrote for the *London Magazine*, and published therein some sonnets of remarkable beauty. He afterwards repaired to Ambleside, to receive pupils, but the scheme failed. Near this little town, so associated with genius, he resided till his death in 1849. He inherited much of his father's genius, and all his weakness of will. He wrote good verses and better prose. As a writer of verse, he is best known by his sonnets, some of which are surpassed only by those of Milton and Wordsworth. His most important prose works are the *Worthies of Yorkshire and Lancashire*, and the *Life of Massinger*.

COLERIDGE, HENRY NELSON, 1800–43; nephew of the English poet, and graduate of Cambridge, devoted to letters, an associate of Macaulay, Praed, and others in writing for *Knight's Quarterly Magazine*, where he appeared over the signature of Joseph Haller. In 1825, he published *Six Months in the West Indies*. The next year he was called to the bar, and about that time married his cousin, the poet's daughter. His most important literary work was done as his uncle's executor in publishing the *Table Talk; Literary Remains;* and *Confessions of an Inquiring Spirit*.

COLERIDGE, SIR JOHN TAYLOR, D.C.L., b. 1790; a nephew of the poet, and member of the English bar. In 1835, he was made a judge of the king's bench, and a privy councilor in 1858. On the retirement of Gifford in 1824, he became for a short period editor of the *Quarterly Review*. He published an annotated edition of Blackstone's *Commentaries*

COLE'RIDGE, SAMUEL TAYLOR, was b. at Ottery St. Mary, in the county of Devon, of which parish his father was vicar, on the 21st Oct., 1772. He was educated at Christ's hospital, and numbered Charles Lamb among his school-fellows. His acquirements in Greek were extensive; and before his 15th year he plunged boldly into the sea of metaphysics, and swam therein until the day of his death. His industry, if desultory, was great; he read whole libraries. Full of book-knowledge, and without ambition or any practical bent, he was on the point of apprenticing himself to a shoemaker, when his head-master interfered, and rescued to literature and thought his most distinguished scholar. A copy of Mr. Bowles' sonnets falling into his hands at this time, attracted him towards poetry, in which for a time he found rest.

In 1791, C. entered Jesus college, Cambridge. At the university, he displayed no mathematical aptitude; his whole mind was given to classics, and he obtained a prize for a Greek ode. He did not take a degree. During the second year of his residence at the university, in a fit of despondency, occasioned by an unsuccessful love matter, he quitted Cambridge for London, and enlisted in the 15th dragoons, under the assumed name of Comberbach. He never advanced beyond the awkward squad, and he enjoyed to the close the reputation of being the worst rider in the corps. One of the officers luckily discovered his classical acquirements, and, becoming acquainted with his real history, communicated with his friends, and C. effected his discharge.

On his release, the poet proceeded to Bristol, and, making the acquaintance of certain poetic enthusiasts—Southey was of the number—whose minds were somewhat unsettled by the revolutionary movement in France, he formed a scheme to emigrate to the banks of the Susquehanna, in North America, and there, in pastoral peace and plenty, to bring back the golden age to man. C. found, to his surprise, that before Paradise could be thus regained, money was indispensable; and as of *that* both he and his friends were absolutely devoid, the dream of "Pantisocracy" had to be given up. About this time, Joseph Cottle, bookseller in Bristol, paid C. 30 guineas for a volume of poems, and, after many delays and the advancement of additional sums, the volume was published. In 1795, he married Miss Fricker—his friend Southey on the same day wedding another sister—and removed to Nether Stowey, a village in Somersetshire, in which neighborhood Wordsworth was then staying. It was here, surrounded with beautiful scenery, and in daily communication with the graver and intenser spirit of his friend, that C.'s principal poems were composed. Here he wrote the *Ancient Mariner*, and the first part of *Christabel*, the music of which took captive Scott and Byron, and which was imitated by both with no remarkable success. At this time, C. was in theology a Unitarian, and preached frequently to congregations of that religious sect. In 1798, he visited Germany, and studied at Göttingen. On his return to England, he went to reside at the lakes, where Wordsworth and Southey then lived; and then it was that the nickname "lake poets" was applied by the opposition reviews to the trio of friends—a nickname which has long since ceased to be a reproach. In the year in which C. went to live in Cumberland, he published his noble translation of Schiller's *Wallenstein*. Having formed a connection with the *Morning Post*, he contributed to its columns articles on politics and literature. In 1804, he was at Malta, acting as secretary to the governor, sir Alexander Ball, an appointment he held nearly a year and a half. In 1808, he delivered lectures on poetry and the fine arts at the Royal institution, London; and the year after, he commenced the publication of *The Friend*, a serial which did not find much commercial success. By this time, C. had written, if he had not published, his finest poems; and imprudent, without resolution or strong sense of duty, and with a taste for German metaphysics and opium gradually taking possession of him, he left his wife and family with Southey, and went to London, where he resided first with Mr. Basil Montague, and afterwards, and up till the period of his death, with Mr. Gillman at Highgate. Here the rays of his splendid genius shone more and more fitfully through clouds of German metaphysics, and his mental and moral fiber became more and more debilitated by opium. He meditated many theological and philosophical works, which were to "reduce all knowledge into harmony," and many epic poems which were to be the glory of literature, and never progressed so far ss the first sentence of either. With the subsidence of the writing faculty, the talking faculty developed itself in C. after a fashion unknown to ancient or modern times. At Mr. Gillman's house, he held weekly *conversazioni*, discoursing on every subject human and divine for hours; and thither, from all parts of the country, ardent young men came rushing to listen to the wisdom of the sage, in "linked sweetness" exceedingly "long drawn out." Towards the close of his life, his religious opinions underwent a change, and he became a believer in the trinity. All intellectual pride had ceased, and the most childlike humility had taken its place. He seemed to be conscious that the greatest powers which for generations had been granted to any Englishman had been by him miserably wasted. He died at Highgate on the 25th July, 1834, in his 62d year.

As an intellectual power, C. manifested himself in a great variety of ways. Compared with his contemporaries, he did not produce a very large amount of original poetry; and of what he did produce, a considerable portion is prosaic and artificial, but the residue is of the highest order of merit. No poet ever evolved such exquisite fantasies, or wove our language into such webs of spiritual melody. He is also to this day the greatest of philosophical critics. He was the first who gave a definite reason for the

"faith that is in us" regarding Shakespeare. He was the first representative of German literature and philosophy in England, and, till Carlyle came, the most potent. His own philosophical and theological writings, although, from constitutional indolence and irresolution, in some measure incomplete, are full of incidental merits, and have given a new impulse to English thought; yet it is right to mention here, that in his philosophical writings he has been convicted of the most extraordinary plagiarism. Prof. Ferrier, in *Blackwood's Magazine*, April, 1840, "tracked the footsteps of this literary reaver through the Hercynian brakes" of Schelling's metaphysics (see also Hamilton's Reid, note), and has shown page after page to be pilfered from the German author. It has been argued, however, by way of explanation and palliation, that C., who certainly did not lack original and penetrating powers as a metaphysician, was, from the sluggishness and irresolution of his mind, better fitted to conceive in outline, and then adapt from others in detail, than to elaborate for himself a system of thought, or even the fragment of a system; while his notoriously confused and dreamy memory would be apt to mingle and confound what was his own with what *might have been* such. As a thinker, C. exerted greater influence through conversation than through books; and to him we are largely indebted for what the young men who listened to him at Highgate, Sterling, Hare, Maurice, etc., have since produced. A complete edition of his *Poetical and Dramatic Works, with Memoir*, was issued in 1877.

COLERIDGE, SARA, 1802–52; only daughter of the poet, and wife of her cousin, Henry Nelson Coleridge, whom she married in 1829. One of her first publications *Pretty Lessons for Little Children*, designed for her own children, became a popular household book. She assisted her husband in editing her father's works, and when the husband died, assumed the whole responsibility herself. She edited *Notes on Shakespeare; Aids to Reflection;* and *Essays on His Own Times*. In 1837, she published *Phantasmion, a Fairy Tale*, her longest original work. In her later years she was a confirmed invalid.

COLEROON', the largest and most northerly branch from the Cauvery, flows, after a course of 93 m., into the bay of Bengal between Trichinopoly on the n. and Tanjore on the s., separating these two districts throughout its last 80 miles. This river is remarkable for two specimens of what is called an *anakatt*, being something of the nature of a weir or dam. For many years, the bed of the C. had been observed to be gradually deepening, while that of the Cauvery, below the point of divergence, was proportionally rising, so as constantly to lessen the supplies for the irrigation of Tanjore. In 1836, however, two anakatts, an upper and a lower, were constructed, to prevent the C. from being further deepened, and to throw more water into the Cauvery—works which were soon found to act so powerfully as to require the balance of an anakatt across the Cauvery itself.

COLES, a co. in s.e. Illinois, watered by Embarras river, and intersected by the Illinois and St. Louis, and Illinois Central railroads; 550 sq.m.; pop. '80, 27,055. The surface is prairie and forest with fertile soil. Chief productions, wheat, oats, corn, butter, wool, and sorghum molasses. Co. seat, Charleston.

COLE'SEED. See RAPE.

COLET, JOHN, 1466–1519; an English theologian who studied in Paris and Italy, and became acquainted with Budæus and Erasmus. Returning to England he filled several offices in the church, ending with dean of St. Paul's. He founded St. Paul's school in London, of which William Lilly was the first master. His religious opinions were so much more liberal than was common at the time that he was subjected to considerable persecution. As dean of St. Paul's, he introduced the practice of preaching from and expounding the Bible; and though he remained in communion with the church of Rome, he disapproved of auricular confession and the celibacy of the clergy. His influence is traceable as paving the way for the reformation.

COLET, LOUISE REVOIL, 1808–76; a French poetess and novelist, wife of a musical professor in the Paris conservatory. Her first work, *Fleurs du Midi*, gained her the friendship of Cousin, but it was so severely criticised by Alphonso Karr that the authoress undertook to stab him with a knife. In 1839, she published *Penserosa*, a second volume of verse; and this was followed by *Le Musée de Versailles*, a poem for which she was crowned by the institute; *La Jeunesse de Goethe*, a comedy; and *Les Cœurs Brisés*, a novel. In 1840, she published *Les Funerailles de Napoléon*, a poem, and *La Jeunesse de Mirabeau*, a novel. In 1849, she was sued by the heirs of Madame Recamier for publishing that famous woman's correspondence with Benjamin Constant. She was crowned five or six times by the institute, more through the influence of Cousin than from the merit of her works. She wrote many stories, plays, didactic poems, and travels, but they show no remarkable talent.

COLE'WORT, a name given to some of the many cultivated varieties of *brassica oleracea* (see BRASSICA), and applied, like the names borecole and kale, to varieties differing from the cabbage (q.v.) in their open heads of leaves, which are used as greens, especially in the winter months. The same name is also given to cabbages cut for use before their leaves have fully closed into heads; and the common kinds of cabbage are often planted pretty close together, in order to be used in this way, for a supply of greens in winter

and spring. C., or *collet*, is said to have been originally a name of the wild plant from which all the cultivated varieties are derived.

COLFAX, a co. in n.e. Mississippi, on the Tombigbee river, intersected by the Mobile and Ohio railroad; formed after the census of 1870. Co. seat, West Point.

COLFAX, a co. in e. Nebraska, bounded s. by Platte river; intersected by the Union Pacific railroad; 500 sq.m; pop. '80, 6,588. Agriculture is the main business. Co. seat Schuyler.

COLFAX, a co. in n.e. New Mexico, on the Colorado and the Rio Grande; pop. '70, 1992. Co. seat, Elizabethtown.

COLFAX, SCHUYLER, b. New York, 1823. He went to Indiana in 1836, where he studied law, and in 1845 became editor of the *Register*, a whig newspaper at South Bend. He was elected to congress in 1854, and was six times re-elected, being speaker of the house in 1863. In 1868, he was nominated for vice-president and elected. Since the expiration of his term, Mar. 4, 1873, he has not been prominently in public life.

COLIBRI. See HUMMING-BIRD.

COLIC (from *colon*—see ALIMENTARY CANAL), a name employed by the later Greek and the Roman physicians to denote diseases attended with severe pain and flatulent distension of the abdomen, without diarrhea or looseness of the bowels. The disease (commonly called *gripes* or *belly-ache*) is now generally believed to be spasmodic in character, and to be dependent upon irregular contractions of the muscular coat of the intestines: its supposed particular connection with the colon, or large intestine, however, is not usually to be made out from the symptoms. Painful disorders of the bowels are very frequent in persons who are not attentive to the regular evacuations, especially when they are exposed to cold so as to experience chill or coldness of the feet, which will often suffice to bring on an attack of colic. The disease is usually attended with constipation (q.v.), and ceases when the regular action of the bowels is restored, although often in this case the operation of medicine is attended by continued pain for a time. Warm fomentations to the abdomen may be employed with advantage, sometimes medicated with opium, or decoction of poppy-heads; and great relief is commonly experienced from friction with a warm liniment, such as opodeldoc, or the soap and opium liniment. Warmth to the feet, and the recumbent posture, are also to be recommended. In very severe or protracted cases, opium may be taken internally. A good remedy in such cases is a full dose of castor-oil (one oz. or more for an adult), with 30 or 35 drops of laudanum, or of solution of morphia. (Opiates should not be given to children except under medical advice, and in very reduced doses.) When C. resists such mild and simple remedies as the above—when it is accompanied by tenderness of the belly, or by hard swelling in any part of it—when constipation is obstinate, or vomiting is present—when there is feverishness, or tendency to exhaustion—or when there is reason to believe that it may depend on any other cause than the mere accumulation of the products of digestion in the intestines, no time should be lost in seeking the best medical assistance that can be procured; for C. is closely allied as a symptom to several very severe and dangerous diseases. One of these complicated forms of C. is termed ileus (Gr. *eileon*, from the idea that its seat was in the small intestine, *ileum*). It is attended with obstruction of the bowels, often from mechanical twisting or involution of one part with another (hence termed *volvulus*). This is, of course, a disease of extreme danger. The only treatment that can be attempted without medical assistance, is the employment of large injections by the lower bowel, and opium in moderate and repeated doses (½ grain to 1 grain, or 12 to 20 drops of laudanum) by the mouth, carefully watched, and discontinued if there is any sign of narcotism. See OPIUM. C. pains are also present in peritonitis (q.v.), another most dangerous form of disease; and they form one marked symptom of the slow poisoning by lead (q.v.), occasionally observed as the consequence of contamination of drinking water by leaden cisterns, etc. In this form, the treatment is different from that of simple C., and will be treated of under lead-poisoning.

COLIGNY, GASPARD DE, a French admiral and gen. of eminence, was b. at Châtillon-sur-Loing, Feb. 16, 1517. Introduced at court, he served under Francis I. in Italy, where he evinced great bravery. Under Henry II., he was made an infantry col., and in 1552, admiral of France. On the death of Henry II., C., who had previously adopted the reformed faith, became, with the prince of Condé, one of the great leaders of the Huguenots. In this capacity he was remarkable alike for his prudence and his bravery. He had the intelligence to plan, as well as the daring to execute, and above all, a heart that was not to be cast down by disasters. At the battles of Dreux and Jarnac, in the former of which Condé was taken prisoner, and in the latter killed, C.'s skill saved the remains of the Protestant army. When peace was concluded in 1570, C. went to court, and was apparently well received by the king (Charles IX.); but the enmity of the Guises, by whom C. was unjustly accused of murdering the duke of Guise at the siege of Orleans, was stirred up against him, and an attempt was made by one of their menials to assassinate him on the street, Aug. 22, 1572. This attempt at individual murder was but a preliminary to the general massacre of Huguenots which took place two days afterwards, and in which C. was basely slaughtered, his body being afterwards exposed to the vile outrages of the mob.

COLI'MA, a name of various application in Mexico.—1. A volcano of the Cordilleras, with an elevation of about 12,000 ft., in lat. 20° n., and not far from the western coast of the republic.—2. A territory of the confederation, with (1868) 63,333 inhabitants, extending about 100 m. along the coast; area about 3,400 sq. miles.—3. The capital of the territory, comprising nearly the half of its population, stands in a fertile plain to the s.w. of the volcano.—4. A seaport on the Pacific, about 40 m. to the s.w. of the capital.

COL'IN. See VIRGINIAN QUAIL.

COLL, one of the western isles of Scotland, off the w. coast of Mull, and forming part of Argyleshire, and 2½ m. n.e. of Tiree isle. It is 14 m. long from n.e. to s.w., with an average breadth of 2½ miles. More than a third of it is cultivated, or in pasture. The isle is low and rocky, and composed of gneiss, approaching to granite and hornblende slate. Pop. 723, engaged in agriculture and fishing.

COLLAMER, JACOB, LL.D., 1792–1865; b. N. Y., but removed when young to Vermont, graduating at the university of that state in 1810. He was admitted to the bar in 1812, and soon became one of the leading lawyers of the state. He was associate justice of the supreme court from 1833 to 1841. In 1842, he was chosen a member of congress, and twice re-elected. He was postmaster general in Taylor's cabinet for a year; and in 1850, was elected judge of the supreme court of the state. In 1856, he was elected to the U. S. senate, where he served until his death.

COLLAR-BEAM, STRAINING-BEAM, etc., the horizontal tie connecting a pair of rafters. Large roofs have two or more collar-beams.

COLLARING, the cylindrical part of the capital in the Doric and Tuscan orders. It is often termed the neck.

COLLAT'ERAL (Lat. *collateralis*). See CONSANGUINITY, SUCCESSION.

COLLATERAL SECURITY is an additional and separate security for the performance of an obligation, or the implement of a bond or covenant.

COLLA'TION, in the law of England, is where a portion advanced by the father to a son or daughter is brought into *hotch-pot* (q.v.), in order that the beneficiary may have an equal share of his personal estate at his death. C. in this sense corresponds to the C. amongst younger children in Scotland. But in that country there is also the C. between the heir and executor. If the heir accept the heritable (real) estate of the deceased, however small it may be, he has no claim to share in the executry or movable (personal) succession; but should he consider it for his interest, he may claim the share of the movable estate which falls to him as next of kin, on condition of his ceasing to be heir by collating the heritage with the executors. The privilege is not confined to a son, but extends also to brothers and other collaterals.

COLLATION TO A BENEFICE is the act of bestowing a benefice by the bishop or other ordinary, where he has right of patronage. When a bishop *confers*, or collates to a benefice, presentation and institution are both comprised in the act of collation.

COL'LÉ, a t. of Italy, situated on the Elsa, about 22 m. s.s.w. of Florence. A steep ridge separates the town into two portions, the lower of which is chiefly occupied by manufactories. C. has a cathedral and castle, and its paper-manufacture is extensive. Wine, olive-oil, and silk are produced in the environs. Pop. 5,000.

COLLECT, a name of uncertain origin, given to certain short prayers in different church-liturgies. It is from the Latin *colligere*, as some ritualists think, because of the comprehensive brevity of such prayers, the matter of the epistle and gospel, e.g., being gathered up, or *collected*, into the C. for the day, as appears in the English Common Prayer Book. Others, with more probability, ascribe to the name an orgin from an ancient practice of the chief minister collecting into a single brief prayer at the end of the service the previous devotions of the people; accordingly, one of the service-books of the ancient Catholic church was called *Collectarium*, as containing such prayers. Of the collects used in the liturgy of the church of England, some are taken from the old Roman missal, and were probably the composition of St. Jerome; others are of more ancient and primitive times, and a few were composed at the reformation. They begin with commemorating some attribute of God, or pleading some infirmity or necessity of man, and end with a simple petition based thereupon. Hence it will be seen that the practical teaching of a church may to a great extent be seen in its collects. For every Sunday, there is a proper C., with corresponding epistle and gospel; and this C. stands for every day in the following week, except in the case of festivals and their eves or vigils, which have collects of their own.

COLLECTIONS AT CHURCHES. The collections which are still made at all churches in Scotland—either at the church-doors before the service, or in the church after it—were, till a comparatively recent period, the principal fund for the support of the poor. By a proclamation of the privy council of 29th Aug., 1693, it was ordered that one half of the sums so collected, and of dues received by the kirk-session, be paid over into the general fund for the support of the poor. The other half has generally been applied for the relief of sudden or temporary distress. By the poor-law act (8 and 9 vict. c. 83), it is enacted (s. 54) that in all parishes in which it has been agreed that an

assessment shall be levied for the relief of the poor, all moneys arising from the ordinary church collections shall in future belong to, and be at the disposal of, the kirk-session; provided, however, that they shall be applied to no purposes other than those to which they were, in whole or in part, legally applicable before the date of the act. A power is reserved to the heritors to examine the accounts of the kirk-session, and to inquire into the manner in which the collections are applied; and the session-clerk is enjoined to report anually as to the application of the moneys, to the board of supervision.

The collections made at dissenting meeting-houses, under which denomination Episcopal chapels are included, are entirely at the disposal of the congregations.

In England, there are no regular C. at churches as in Scotland. The alms collected in chapels, as well as in parish churches, during the reading of the offertory, are declared by the rubric to be at the disposal of the incumbent and church-wardens of the parish, and not of the minister or proprietor of the chapel. If the minister and church-wardens disagree as to the distribution of the alms, they shall be disposed of as the ordinary shall appoint. See OFFERTORY.

COLLEGE (Lat. *collegium*, a collection or assemblage). In its Roman signification, a C. signified any association of persons for a specific purpose. In many respects it was synonymous with *corpus*, a body or collection of members, a corporation—with *universitas*, a whole as contrasted with its parts—and with *societas*, a company or partnership, as opposed to all the members of which it was composed. A Roman C. had a common chest, and it could sue and be sued in the name of its manager (actor or syndicus), just like an incorporation with us. It required also to be incorporated by some sort of public authority, springing either from the senate or the emperor. A C. could not consist of fewer than three persons, according to the well-known maxim, "three make a college" (Dig. 50, tit. 16, l. 85). Some of these colleges were for purely mercantile purposes, but there were others which had religious objects in view, such as the *collegia pontificum, augurum*, etc., and which thus made a sort of approach to a C. in the modern sense. With us, a C. is an incorporation, company, or society of persons, joined together generally for literary or scientific purposes, and frequently possessing peculiar or exclusive privileges. See PHYSICIANS, COLLEGE OF; SURGEONS, COLLEGE OF. Very often in England a C. is an endowed institution connected with a university, having for its object the promotion of learning. In this relation, a C. is a sub-corporation, i.e., a member of the body known as the university. The constitution of a C. in this, its most general and proper sense, depends wholly on the will of the founder, and on the regulations which may be imposed by the visitor (q.v.) whom he has appointed. For a more detailed acccount of C. in this sense, see UNIVERSITY, OXFORD, CAMBRIDGE, PARIS, EDINBURGH, etc. In Scotland and in America, the distinction between the C. as the member, and the university as the body, has been lost sight of; and we consequently hear of the one and the other indiscriminately granting degrees, a function which in the English and in the original European view of the matter belonged exclusively to the university. Where there is but one C. in a university, as in the case in all the universities of Scotland, the two bodies are of course identical, though the functions which they perform are different. In Germany, there are no colleges in the English sense; and though the universities in that country perform precisely the same functions as in Scotland, the verbal confusion between the C. and the university is avoided by the latter performing the functions of both in its own name, as two separate parts of its proper duties. In France, C. has a meaning totally different from that which we attach to it: it is a school, corresponding, however, more to the gymnasium (q.v.) of Germany than to the grammar-school of this country. All the colleges are placed under the university of France, to which the centralizing tendencies of that country have given a meaning which also differs widely from that which the term university bears in England. See UNIVERSITY OF FRANCE.

COLLEGE OF ARMS. See HERALDS' COLLEGE.

COLLEGE HILL, a village in Hamilton co., Ohio, 6 m. n. of Cincinnati, the seat of Farmers' college, and of the "Ohio Female College."

COLLEGE OF JUSTICE, in Scotland, which was formed on the model of the parliament of Paris (q.v.), consists of the supreme civil court (see COURT OF SESSION), with all its members and officers. The title occurs in the statute 1537, c. 36; and in 1540, c. 93, the judges are styled senators. The present members of the C. of J. are, in addition to the judges, advocates (Anglicè, barristers), clerks of session, clerks of the bills, etc.; writers to the signet, solicitors before the supreme courts (not solicitors at law), depute-clerks and their substitutes, etc.; clerks of exchequer, directors of chancery, and their depute and clerks, the writer to the privy seal and his depute, clerks to the general registers of sasines and hornings, macers of the court of session, the keeper of the minute-book, the keeper of the rolls of the inner and outer house, one clerk to each judge, one clerk to each advocate, the extractors in the register house, and the keeper of the advocates' library. In addition to the above, the keeper of the judicial records, the assistants to the principal clerks of session, the auditor of the court of session, and the collector of the fee-fund, are members *ex officio* by 1 and 2 Geo. IV.

COLLEGE POINT, a village in Queen's co., N.Y., on Long Island sound, and a branch of the Long Island railroad, 11 m. e. of New York; pop. about 4,500. There are several manufactories, one very large establishment making india rubber goods.

COLLEGES, AMERICAN, have been organized mostly according to one general plan. A corporation, acting under a charter granted by the legislature, has control of the property, appoints the instructors, makes laws for the government of the institution, and confers degrees. In some colleges, the trustees fill the vacancies which occur in their body; in others, the state appoints some or all of the board; and in an increasing number, the alumni elect a certain part. In this country, the distinction between a college and a university has never been sharply drawn. Some of the youngest and smallest institutions call themselves universities, and some of the oldest have out-grown the condition of the college, assuming the name of the university.

As a large number of American colleges were established with special reference to the training of young men for the Christian ministry, the course of study was naturally arranged in accordance with that design. A century ago the studies chiefly pursued were Latin, Greek, mathematics in limited measure, and, in larger proportion, logic, metaphysics, rhetoric, and oratory. Theology received special attention during the latter part of the course. Towards the close of the last century, natural philosophy and astronomy began to be more thoroughly studied. Modern languages and physical and political science had hardly an assured place in the course until after the present century began. Towards the middle of the century, there was manifest an increasing dissatisfaction with the restricted course. Formerly there had been three distinctively marked professions—theology, medicine, and law; but as new employments were developed, having the dignity and responsibility of professions, modifications in preparatory studies became necessary. To secure them, various methods were proposed. Some persons demanded that the course of study in existing colleges should be changed by dropping certain studies, so making room for those with new and higher claims; others desired that new studies should be added to the old, or that parallel courses should be established with liberty of choice between them; a third class believed that new institutions were required for the new studies. Much has been accomplished in all these directions except the first. No previously established college has abandoned the old course, and it is not probable that any one will. But very many have added to the old course elective studies which are submitted to the student's choice. Parallel courses, also, have been established. The old method aims first at securing mental development, culture, and discipline, which may afterwards be applied to the chosen course of life. The new makes immediate preparation for that course its first aim, and is satisfied to have mental discipline and culture as the incidental yet the assured result of the studies pursued. In most of the new institutions of the west, there are several courses of study, among which students are allowed their choice. The older colleges of the east, even the oldest, are impelled to follow in the same path. They have all, for some time past, given a limited range of elective studies during the latter half of the course. In 1869, Harvard extended the liberty of choice through three out of the four years. The movement has reached beyond the Atlantic, even the university of Oxford, where the supremacy which Latin and Greek had maintained for centuries has been broken. In 1872, the statutes were amended so as to include mathematics, natural science, natural history, jurisprudence, and theology, among the subjects in which candidates for degrees may be examined, and to allow a wide range both in subjects and authors, on which the examination may be passed. The latitude of choice is even greater than in most American colleges.

Besides elective courses in a college, separate colleges have been established exclusively for scientific and practical studies. Some of these are departments of existing colleges, e.g., the scientific schools in Yale, Columbia, Princeton, and Lafayette colleges; and some are independent, e.g., the institute of technology, in Boston, and the Stevens institute at Hoboken, and the agricultural and industrial colleges endowed under the congressional grants of 1862. These changes are partly the result and partly the cause of the great development of physical science which marks the present generation. The science of matter, as distinct from the science of man and of mind, now importunately demands a high place in public regard. Yet the old science cannot be driven out. It has a sphere into which nothing can intrude. The greater the increase of material knowledge, the more will mental and spiritual attainments ultimately be required. The wisest friends of metaphysical study, therefore, view with no disfavor the splendid augmentation of facilities for physical investigation.

Examinations at college, when designed as tests of comparative scholarship, are now, from the beginning of the course to the end, conducted in writing and by means of questions furnished alike to the whole class and at the same time. This method commends itself by its fairness to every mind; yet "examination papers" are scarcely more than one generation old.

Separate colleges for the education of women have been established with great success. But because of the inadequacy of these, at least in point of numbers, many persons are debating the question—Shall not young women be admitted into the same institutions and be taught in the same classes with young men? On the affirmative side it is maintained that as the sexes are associated together in the employments of childhood and

of mature life with safety and advantage, so may they be in acquiring their education. Those who take the negative side reply that this is the period during which their association together is attended with the greatest dangers, and is most in need of restrictions, which cannot, in general, be fully maintained during the exercises of college life.

COLLEGIANTS, a sect in Holland who called their assemblies colleges. They rejected creeds, had no regular ministry, nor any form of church government. They adopted baptism by immersion, but their communion was open to all. They were not unlike the Plymouth Brethren of the present day.

COLLEGIATE CHURCHES—so called from having a college or chapter, consisting of a dean and canons, attached to them—differ from cathedrals in that the see of the bishop is at the latter. The service is or should be the same in both. They are under the jurisdiction of the bishop of the diocese in which they are situated, and he exercises visitorial powers over them. Those remaining in England are Westminster, Windsor, Wolverhampton, Heytesbury, Southwell, Middleham; also Brecon in Wales, and Galway in Ireland. Ripon and Manchester have been constituted the cathedrals of the new dioceses. Some churches called collegiate (as Beverley) have no chapters.

COLLEGIATE INSTRUCTION FOR WOMEN, PRIVATE (familiarly known as the "Harvard Annex"). For several years prior to 1879, the question of the higher education of women had fixed the attention of a small circle of friends of Harvard college, including a portion of its alumni and instructors. The opening of many other colleges to the entrance of women, and the founding of several more for their exclusive advantage, naturally raised the question whether Harvard should not take some part in a movement which was exciting so profound an interest both in this country and in Europe. The opposition to admitting women to the college was based on cherished traditions, and strengthened by fears that could not be lightly disregarded. Yet it was felt that in some way the superior advantages of Harvard should be made available to those women that sought them. The parents of one family, who had the subject much at heart, after consultation and inquiry, happily succeeded in devising a plan which quickly commended itself to leading members of the faculty, and which has been executed with satisfactory results. The plan, in brief, was, to provide for women a course of private study, under the direction, voluntarily given, of the most distinguished members of the faculty; and to give to those who successfully pursued this course certificates of their proficiency. Some of the most eminent and conservative friends of the college gave this plan their hearty concurrence, and the professors whose co-operation was most desired offered their assistance. It was seen that an experiment of the highest importance could thus be made without involving the college itself in responsibility or alarming its most conservative supporters. Every step in execution of the plan was carefully and deliberately taken. A board of managers, composed of ladies of the highest social standing, was formed. The president of the college was duly informed of the whole project, and his advice carefully weighed. A committee of five of the professors was appointed as an advisory board, with instructions to establish a working scheme, lay out the courses of study, and fix the conditions for the admission of students. When due preparations had been made, the lady managers issued a circular explaining the plan, and stating that further information as to the qualifications required of pupils, with the names of the instructors in any branch of study, might be had upon application to their secretary or any one of their number. The requisitions for admission were established by taking as standard the Harvard examinations for the admission of freshmen. April 9, 1878, a second circular was sent out, in which the conditions of admission were definitely stated for the academic years 1879–80 and 1880–81, with the announcement that the courses, if successful, would be continued. "Any one," said the circular, "will be admitted to the instruction here afforded who passes satisfactorily in any eight of the following subjects: 1. English; 2. Physical geography; 3. Botany or physics; 4. Mathematics, including arithmetic, algebra through equations of the first degree, proportions, fractions, and common divisor; 5. Mathematics, including algebra through quadratics, and plane geometry; 6. History; 7. French; 8. German; 9. Latin; 10. Greek. Examinations to be held in Cambridge, New York, Philadelphia, and Cincinnati; beginning May 28, 1879. Regular fee for examination, $15. Fee for a year's instruction, $200." Arrangements were proposed also for special students in selected branches, and for advanced studies. Applications came in rapidly, and 27 women, most of whom desired to take advanced studies, were admitted. Twenty-four courses of instruction were given during the first year by eight professors, seven assistant professors, and eight instructors. The college recitation rooms were not used by the lady students. Two ladies, living near the college, generously opened their houses to the "annex," one giving up her library for recitations, the other her parlor as a consulting-room. Thus, without any departure from the privacy of home life, the ladies pursued their studies, with no excitement in or around the college. It was feared that the presence of the lady readers in the library, side by side with the young men, might lead to unpleasant consequences; but the young lady who most frequented the place testified that the courtesy of the college students was all that could be desired. It may possibly be discovered in the future that the same courtesy is to be depended upon if the lady students should be admitted to the recitation room as well as the library. The "annex" has more than

fulfilled the best anticipations of those who created it. The professors and instructors who have had charge of the lady students are cheered, perhaps even surprised, by the result of their labors. "There is, on the part of our academic faculty," says the professor of ethics, the venerable Dr. Peabody, "entire satisfaction with the working of our system for the education of women." The simple organization, which is all that is required, has Arthur Gilman as its secretary.

COL'LES, CHRISTOPHER, 1738–1821; a native of Ireland, who came to America before the revolution and delivered lectures in New York on land-locked navigation. One of the first steam-engines made in the country was designed by him; and he was among the earliest to propose water-supply by reservoirs for the city of New York. He anticipated the great Erie canal as early as 1784, when he recommended to the legislature the connecting of lake Ontario with the Hudson river by canals and such natural channels as could be used, and with this purpose in view he surveyed the Mohawk river. He first explored the principal roads of the state of New York, and published descriptions of them.

COL'LETON, a co. in s.e. South Carolina, on the Atlantic ocean, intersected by the South Carolina and the Savannah and Charleston railroads; 1672 sq.m.; pop. '80, 36,390—24,241 colored. The soil is level, and mostly alluvial, producing cotton, corn, sugar, and great quantities of rice. Co. seat, Waterborough.

COL'LETON, JAMES, one of the governors of the province of South Carolina, appointed in 1686 in the interest of the proprietors, one of whom was his brother. The colonial parliament and the people, however, were opposed to him, and when William and Mary were proclaimed he was deposed and banished.

COLLET'TA, PIETRO, 1775–1831; a native of Naples who took an active part during the French invasion, and in 1812 became a gen. The restoration of the Bourbons made him a prisoner; but when the revolution began he was sent to Sicily as viceroy, and soon afterwards made minister of war. He endured other banishments, but was permitted to die in Florence.

COLLIER, ARTHUR, 1680–1732; rector of Langford in England, a charge which had come down through the family from his great-grandfather. His most important work was *Clavis Universalis, or a New Inquiry of the Truth, being a Demonstration of the Non-existence or Impossibility of an External World.* But in the substance and purposes of this work he had been anticipated by others, notably by bishop Berkeley, and though it was translated in Germany, it attracted very little notice elsewhere. Its thought is crude, and it lacks the scientific development which has commended bishop Berkeley's work even to thinkers of our own day.

COL'LIER, JEREMY, a celebrated non-juring clergyman, was b. in Cambridgeshire on the 23d Sept., 1650. He went to Cambridge in 1669, and took his degree of M.A. in 1676. At the revolution of 1688, he first plunged into the stormy waters of controversy, his foeman being Burnet, afterwards bishop of Salisbury. For a publication of his at this time, entitled *The Desertion Discussed,* which gave offense to the government of William, he was sent to Newgate, where he remained several months. On his release, he rushed anew into the wars of party, and distinguished himself therein by the publication of several controversial works. Suspected of being a partisan of the Stuarts, he was again arrested in 1692, and imprisoned for a short time in the king's bench. From this period, his life was a scene of perpetual literary strife, government being the principal object of his attack. He died in London, 26th April, 1726. C. wrote many books, including the *Ecclesiastical History of Great Britain;* but the work by which he is best known is his *Short View of the Immorality and Profaneness of the English Stage,* published in 1698. Congreve and Farquhar came to the rescue of their craft, to the great delight of C., who was never happier than when wielding the satirical whip, and who had no objection to encounter a couple of opponents at a time. The combat lasted for ten years, and at the close, C. remained master of the field. His strictures on the stage were needed at the time, and his writings materially aided its subsequent purification. He was engaged in strife up to the close of his career, and died almost with arms in his hands.

COLLIER, J. PAYNE, a well-known Shakespearean critic and commentator, was b. in London in 1789. In 1820, he published *The Poetical Decameron,* in 2 volumes. From 1825 to 1827, he superintended a new edition of Dodsley's *Old Plays,* in 13 volumes. Mr. C., whose position in connection with the library of the duke of Devonshire, gave him great advantages for the study of our early dramatic literature, published in 1831, in 3 volumes, what may safely be called his best work, a *History of English Dramatic Poetry to the Time of Shakespeare, and Annals of the Stage to the Restoration.* From 1835 to 1839, he published, also in 3 volumes, *New Facts regarding the Life and Works of Shakespeare.* He also gave to the public an edition of the works of the illustrious bard of Avon (1842–44). Not content with these efforts for the illustration of his favorite author, Mr. C., in 1852, published a volume, entitled *Notes and Emendations to the Text of Shakespeare's Plays, from Early Manuscript Corrections in a Copy of the Folio of* 1632, *in the Possession of J. P. Collier.* This publication excited great commotion in the literary world; opinion was divided, and the *Emendations* were furiously applauded or furiously assailed. It was in time generally admitted that many of them were just corrections

of typographical errors; that many, in cases where the author's meaning was doubtful, displayed very remarkable ingenuity; but that others darkened texts which, save to a commentator, were transparent enough. Later, it was even alleged by some that C. had himself written the marginal emendations in a feigned hand. In 1866, he commenced a series of reprints of our early poets and pamphleteers. His last work is his *Bibliographical Account of Rare Books* (1865).

COLLIMATOR, AND COLLIMATION, in astronomy, determining the zenith point on a vertical circle without using the plumb line, the spirit level, or any reflecting surface, and that too at any moment of time. There are two kinds of collimators, the horizontal, and the vertical. The horizontal collimator is a telescope of small dimensions, firmly attached to a cast-iron plate floating on mercury, and having a cross wire in its focus. A telescope thus arranged, when placed on the surface of a basin of mercury, will always assume a horizontal position. By illuminating the cross wires the rays from them will issue parallel, and may always therefore be brought to a focus by the object-glass of any other telescope; in which they will form the image of any celestial object in their direction. The vertical collimator consists of a vessel of mercury towards which the object-glass of a telescope, attached to a circle or transit instrument, may be directed, so that the cross wires in its focus may be reflected in the mercury. The wires of the instrument are illuminated by a lamp placed laterally so that the rays from the lamp may be conducted to the wires without entering the eye of the observer; the telescope is then directed to the surface of the mercury. The rays issue from the wires in parallel lines, and are reflected back to the object-glass, which is enabled to collect them again to its focus. By this means a reflected image of the cross wires is formed which indicates the vertical position of the tube with great accuracy.

COLLIN, a co. of n.e. Texas, watered by one of the branches of Trinity river; 870 sq.m.; pop. '80, 25,985—1979 colored. Agriculture and stock-raising are the chief occupations. Co. seat, McKinney,

COLLIN', or KOLIN', a town of Bohemia, picturesquely situated on the left bank of the Elbe, about 39 m. e.s.e. of Prague, on the railway between that place and Vienna. It is surrounded by walls, is well built, and has an old castle, and manufactures of cotton and potash. Carnelians, garnets, and topazes are found in the neighborhood, and polished here. Pop. 9,460. In the vicinity was fought, in 1757, the famous battle in which Frederick the great was defeated by the allied Austrian and Saxon armies under marshal Daun.

COL'LINE is a term applied to common gelatine, or glue (q.v.).

COLLINGWOOD, a t. in Simcoe co., province of Ontario, Canada, on the Georgian bay; pop. '70, 2,829. It is important as the terminus of the Northern railway on the line of travel to and from lake Superior.

COLLINGWOOD, in Australia, a suburb of the city of Melbourne, on the n.e. toward Yarra Yarra, having a pop. of nearly 20,000. There are many public buildings and manufactories.

COL'LINGWOOD, CUTHBERT, Admiral Lord, was b. at Newcastle-upon-Tyne, 26th Sept., 1750. Sent to sea as a midshipman at the age of eleven, his life thenceforth, with the exception of some half-dozen years, was spent wholly on board ship. He was an intimate friend of Nelson, whom he followed up the ladder of promotion step by step, until Nelson's death left the topmost round vacant for himself. Among the great naval victories in which C. bore a prominent part, were those of lord Howe off Brest in June, 1794; of lord Jervis off cape St. Vincent in 1797; and of Trafalgar in 1805, where he held the second command. In the last-named engagement, his ship was the first to break through the line of the combined French and Spanish fleets; and after Nelson had received his death-wound, he assumed the chief direction, and completed gloriously the triumph which had been so daringly commenced. A peerage was his reward for his gallant conduct in this battle. After several years' able service in the Mediterranean, C. died at sea Mar. 7, 1810. He was a thorough seaman, unsurpassed, if not indeed unequaled, by any officer in the navy. He never permitted his ardent courage to outrun his cool judgment. At once firm and mild in command, the seamen appropriately called him their father; while his private virtues and generous kind nature endeared him to all who came in contact with him as equals.

COLLINS, ANTHONY, an able free-thinking writer on religious questions, was b. in 1676, at Heston, near Hounslow, in Middlesex. He studied at Eton, and afterwards at King's college, Cambridge. In 1707, he published his *Essay Concerning the Use of Human Reason;* and in 1709, his *Priestcraft in Perfection*, etc., which fluttered the churchmen of that time exceedingly. The controversy excited by this last work induced C. to write his *Historical and Critical Essay on the Thirty-nine Articles.* His next work was a *Vindication of the Divine Attributes*, in reply to the archbishop of Dublin, who asserted the compatibility of divine predestination and human freedom. C. was a philosophical necessitarian, and afterwards advocated his opinions more fully in his *Philosophical Inquiry Concerning Liberty and Necessity* (1715). In 1711, he went to Holland, where he made the friendship of Le Clerc and other eminent *literati.* On his return to England, he published his *Discourse on Free-thinking*, the best known and

the most important of all his works. In 1718, he was made treasurer for the co. of Essex; and in 1724, appeared his *Grounds and Reasons of the Christian Religion*, which gave occasion to no less than thirty-five replies. Two years later, he defended himself in his *Scheme of Literal Prophecy;* and in 1727, published his last work, *A Reply to Dr. Roger's Eight Sermons on the Necessity of Revelation and the Truth of Christianity.* C. died in Dec., 1729. He was a friend and correspondent of Locke, who declared that "C. had as much love of the truth for the truth's sake, as ever he had met with in anybody." His character for integrity and benevolence stood very high.

COLLINS, MORTIMER, 1827–76; an English poet and novelist, early engaged in journalism in London. In 1855, he published a volume of lyrics, and ten years later his first novel, *Who is the Heir?* and another volume of verse. *The Inn of Strange Meetings*, was issued in 1871, and the next year he produced his longest poem, *The British Birds, a Communication from the Ghost of Aristophanes.* He was a prolific contributor to journals and magazines, and wrote several other novels, of which *Sweet Anne Page* was very popular.

COLLINS, WILLIAM, a poet of considerable merit and reputation, was b. Dec. 25, 1721, at Chichester, where his father was a hatter. He received his education at Winchester college and Oxford. In 1742, he published a small volume containing the *Oriental Eclogues*, and the *Epistle to Sir Thomas Hanmer.* These are not so characteristic of his genius as his later writings. Although the publication was not attended with success, he resolved upon a literary career, and with this object went to London in 1744. Here, from time to time, he published other poems, chiefly consisting of odes; but misfortunes, occasioned chiefly by his own indolence and irresolution, finally rendered him a prey to melancholy, which at times deepened into insanity. This has imparted an interest to his memory which his works alone might not have been able to excite. He died at Chichester in 1756. The poems which he has left are comparatively few; but they entitle him to no mean rank among the poets of the 18th century. He was essentially a lyrical poet; and it is upon his odes that his reputation is principally founded. All his best qualities are exhibited in the well-known ode on *The Passions*—a poem which, at the time it was written, was undoubtedly one of the finest odes in the language. The personification of the passions is true and striking, and the variation of the measure is well adapted to the various emotions to be expressed. Among his other pieces may be mentioned the odes *To Liberty, To Mercy, To Evening, Ode written in* 1746, and the first part of the ode *To Fear.*

COLLINS, WILLIAM, R.A., a distinguished English artist, was b. in Great Tichfield street, London, Sept. 18, 1787. C. early displayed a decided taste for art. In 1807, he entered the royal academy as a student, and in the same year he exhibited two pictures at the academy's exhibition. At first, necessity obliged him to devote himself to portraits, but money coming in rapidly, he was soon able to give his genius its bent; and his children swinging on gates, his children gazing in delighted wonderment on the newly discovered nest, his coast-scenes, his groups of prawn-fishers, his shrimpers on the ebbed sea-beach, drew admiring eyes as they hung on the academy walls, and brought remunerative prices. C. was elected R.A. in 1820. In 1836, he visited Italy, and remained there nearly two years, studying the great masters, and sketching monks and peasants, and groups of bronzed children. In 1839, he sent to the academy several Italian pictures, which were greatly admired. His attempts in another direction—"Our Saviour with the Doctors in the Temple" (exhibited in 1840), and "The Two Disciples at Emmaus" (1841)—were not particularly successful, and he wisely fell back on his green fields, his sea-beaches, his rustics, and his children at their games. His death took place in London on the 17th Feb., 1847.

COLLINS, WILLIAM WILKIE, son of the preceding, was b. in 1825, and was educated for the bar. He is widely known as a novelist and miscellaneous writer. He is a great master of mystery, and can so hide a secret in a wrappage of circumstance, that, before it is discovered, the whole tissue must be unrolled. Several of his works are models of construction; and in working out his plots, he diverges neither to left nor right, indulging neither in irrelevant pathos nor description. His principal works are *Antonina; Basil; Hide and Seek; After Dark; The Dead Secret;* and *The Woman in White* (1860); *No Name; My Miscellanies; Armadale; The Moonstone; Man and Wife* (1870); *The New Magdalen* (1873); and *The Law and the Lady* (1875).

COLLINSON, PETER, 1693–1768; an English botanist, a member of the society of Friends. He corresponded with Benjamin Franklin, Cadwallader Colden, and other men of science of the period, and is said to have sent to Franklin the first electrical machine known in America. One of his pursuits was the naturalization of plants, flowers, and trees. He sent English plants to America and brought American plants to his own country, successfully introducing many new species. He is also credited with first suggesting grape cultivation in Virginia.

COLLISION, in mechanics, the meeting of two bodies, one or both of which are at the time in motion. The motion or velocity of the bodies after the contact depends upon their firmness, or solidity. If perfectly incompressible, they will move together

as one body; if elastic, they will be more or less compressed, but will resume their shape, and the motion will depend upon the amount of force created by the collision.

COLLISIONS OF VESSELS. To prevent vessels running against one another in passing, there is a "rule of the road" (q.v.) at sea as well as on land. The Trinity house lays down regulations which, though not having the force of law, are recognized by the admiralty, and govern the decisions in cases of collision. In general, they are analogous to the rules observed by pedestrians in crowded thoroughfares, and by vehicles on highways. It is at night that the danger of collision is greatest; and hence the necessity for a well-arranged system of lights and other precautions. Of 3,590 casualties of all kinds on and near the coasts of the United Kingdom in 1874–75, 659 were due to collisions; of these 61 resulted in total loss. The average of the results of collisions for the 10 years 1865–75, gives: total loss, $81\frac{2}{3}$; partial damage, $345\frac{8}{10}$.

COLLISION OF VESSELS (*ante*). If a collision happens without fault, and no blame can be charged to those in charge of either vessel, each party must bear its own loss. In case both parties are at fault, neither can have relief at common law; but maritime courts aggregate the damage to both vessels and their cargoes, and divide the amount equally between the two. In case of inscrutable fault, that is, by a fault of those in charge of one or both vessels, and yet under such circumstances that it is impossible to learn who is at fault, the rule of equal division is also adopted. Where the fault is on the part of one vessel and no fault on the other, the owners of the vessel at fault must bear their own loss, and are also liable for the damage to the other vessel. In some cases the personal liability of owners is limited to the value of the vessel and freight. Strict laws, rules, signals, etc., are adopted by all nations to prevent collision. (See NAVIGATION, LAWS OF, *ante*.) But, no matter how exacting be the rules, cases will occur when their following would result in disaster. No vessel should unnecessarily incur the probability of collision by strict adherence to the rules. If it is clearly in the power of one vessel to avoid collision by departing from the rules, she will be held bound to do so; but a vessel is not required to depart from the rule when she cannot do so without danger. A proper lookout must be kept; the absence of such a lookout is in itself evidence of negligence. In some cases certain lights must be kept. Losses of the injured vessel by collision are within the ordinary policy of insurance; but when the collision is the fault of the insured vessel, or of both vessels, the insurer is not ordinarily liable for injury done to the other vessel which may be decreed against the vessel insured; but recent policies provide that the insurer shall be liable in such case. Undue speed on the part of a steamer in a dark night, or in thick weather, or in crowded thoroughfares of commerce, will render the steamer liable for damages occasioned by collision; and it is no excuse to plead that the steamer was carrying the mails. Where a pilot is lawfully in charge of a vessel, he only is responsible for damages; but it must be shown that the collision was due to his fault.

COLLO'DION (Gr. *kollao*, to stick). This substance, on its first introduction, employed in surgery as a preservative of wounds, etc., from contact of air, by means of the tenacious and transparent film which it leaves on evaporation—and now, also, in a slightly modified form, remarkable as the basis of a highly sensitive process for taking pictures by the agency of light—may be defined as a solution of *pyroxyline* in a mixture of alcohol and ether, to which is added, for photographic operations, a small quantity of some soluble iodide, bromide, or chloride.

The first step in making C. is the preparation of pyroxyline: Take 10 fluid oz. of sulphuric acid, specific gravity 1.84, in a dish; add 12 fluid drams of water, and 10 fluid oz. of nitric acid, specific gravity 1.45; and raise the temperature to 140° by immersing the dish in boiling water. One oz. of pure linen or paper should now be immersed in small pieces at a time, keeping the mixture in motion until the liquid is nearly absorbed by the linen or paper.

The action having continued for about ten minutes, the contents of the dish should be plunged into a vessel containing a large quantity of water, which should be speedily poured off and repeatedly changed, until the linen or paper is so thoroughly washed as not to give the slightest indication of acid to the most delicate test-paper, after which it should be slowly dried at a low temperature, and preserved in a glass bottle for use.

One hundred and four grains of the pyroxyline thus prepared are dissolved in a mixture of 16 oz. of pure sulphuric ether, and 2 oz: alcohol, specific gravity .840; and to this mixture are added 48 grains iodide of cadmium, 30 grains iodide of potassium, and 25 grains bromide of cadmium, dissolved in 4 oz. of alcohol, of specific gravity .840. C. thus prepared should, after becoming clear by subsidation, yield a rich creamy film of iodide and bromide of silver on immersion in the nitrate bath.

The foregoing formula yields a C. very suitable for taking what are termed *negative* impressions in the camera; but when it is desired to take *positive* pictures, cotton wool should be substituted for linen or paper in the preparation of the pyroxyline, and the iodizing solution should contain iodide of ammonium instead of iodide of potassium. It is important also that the alchol employed should be free from organic impurities in the shape of fusel and grain oils, small traces of which mar the purity of the high light in a positive, though their presence is comparatively harmless in a negative pho-

tograph. For the details of manipulation involved in, and apparatus required for, the practice of the C. process, the reader is referred to the excellent treatise by Mr. Hardwich on that subject.

COLLO'DIONIZED PAPER PROCESS. Paper being substituted for glass in this process, as a basis upon which to support the film, a great increase in portability is arrived at, as the sensitive sheets may be carried in a portfolio, and employed in the same manner as dry collodion plates. There are difficulties, however, in the way of its successful practice, which have prevented it from becoming as popular as it deserves to be. The following is a brief summary of the manipulations. Mr. Corbin, the inventor of the process, ascertained that a peculiar collodion was requisite, the formula of which is as follows: ether, 650 parts; alcohol, 350 parts; pyroxyline, 15 parts; iodine, 1¼ parts. The collodion so prepared is poured on the glass in the usual way, and sensitized in a bath containing only 1 per cent of nitrate silver, and a ½ per cent of nitric acid. The plate having remained in this bath about 2 minutes, is withdrawn, and freely washed with water; it is then immersed in a solution of 1 per cent of iodide of potassium, to insure the complete decomposition of the whole of the free nitrate of silver not removed by the washing. A piece of negative paper is now coated with a solution of gelatine, containing 6 parts of gelatine to 100 parts water; the dimensions of the paper should be rather less than the glass, and the gelatinized side is brought into contact with the collodion film in a dish of water, any intervening water being expelled by passing a glass rod lightly over it. The edges of the collodion film which project beyond the paper are folded back on it, and the film and paper removed together. The now collodionized paper is laid, film uppermost, on a glass plate, coated with a preservative solution, composed of equal parts of albumen and honey, diluted sufficiently to enable it to flow freely over the paper. The film is lastly sensitized in a solution of nitrate of silver, 5 parts; glacial acetic acid, 5 parts; water, 100 parts; it is then freely washed as before in water, and hung up to dry. As it is apt to wrinkle in drying, it should be attached by all four corners to two lines, running one under the other.

COLLORE'DO, the name of an Austrian family, a branch of the house of Waldsee, dating from the 11th century. They were distinguished in the thirty years' war, in the siege of Candia, and in diplomacy in all parts of Europe.

COLLOT D'HERBOIS, JEAN MARIE, one of those men who gained an infamous notoriety in connection with the first French revolution, was b. in Paris, 1750. Originally a provincial actor, the revolutionary movement attracted him to Paris, where his impudence, his loud voice, and his *Almanach du Père Gérard*, which obtained the prize of the Jacobin club, secured for him public recognition, and he was elected to the national convention as one of the deputies for Paris. His general ferocity marked him out as a fit person for the presidency of the convention, to which he was appointed June 13, 1793, and as a member of the murderous committee of public safety. Sent by Robespierre to Lyons, in Nov., 1793, C. took bloody revenge on the inhabitants for having once hissed him off the stage in the theater. Not less than 1600 persons were destroyed by the guillotine and by discharges of grape-shot. An attempt made to assassinate C. (May 23, 1794) served only to increase his popularity, and thus excited the envy of Robespierre, who determined to destroy so formidable a rival. C. therefore took a prominent part in the overthrow of Robespierre and his party in July, 1794, but the reaction following this event proved fatal to himself. C. was expelled from the convention, and in Mar., 1795, was sentenced to deportation to Cayenne, where he caught a fever, and died in great agony, Jan. 8, 1796. Besides revolutionary pamphlets, C. wrote a great number of dramas, now utterly forgotten.

COLLU'SION, an agreement between two or more persons to defraud. The law abhors C., and consequently it has the effect of voiding every transaction which is founded upon it. Arrangements between bankrupts and creditors whom they wish to favor, on the eve of bankruptcy, are amongst the most frequent instances of C., and one of the leading objects of all systems of bankrupt law has been to defeat them. In England, C. is spoken of as "a deceitful agreement or contract between two or more persons, for the one to bring an action against the other, to some evil purpose, as to defraud a third person of his right."—*Tomlin's Dictionary.* But there is no limit to the circumstances in which the occurrence of C. is conceivable in any country.

COLLYER, ROBERT, b. England, 1823. He emigrated to the United States in 1847, and became a Methodist minister. In 1850, he adopted Unitarian views, and soon became one of the most famous preachers of that denomination. From 1859 to 1879 he was pastor of the Church of the Unity, Chicago. He is at present in charge of the Church of the Messiah, New York city. He is also widely known as a lecturer.

COLMAN, BENJAMIN, D.D., 1673–1747; b. Boston; graduate of Harvard, 1692. He was the first pastor of the Brattle street church in Boston, holding the place until his death, a period of nearly 50 years. He was chosen president of Harvard college, but declined the office. His sermons and some poems were published.

COL'MAN, GEORGE, commonly called "the Elder," a dramatic author and theatrical manager of last century, was b. at Florence about 1733. In 1760, his first dramatic piece, entitled *Polly Honeycomb*, was produced at Drury lane with great success. Next

year, he gave to the world his comedy of *The Jealous Wife*, and in conjunction with Mr. Garrick, he in 1766, wrote *The Clandestine Marriage*. In 1761, he became one of the purchasers of Covent Garden theater, and held the office of acting manager for seven years, after which period he sold his share. In 1777, he purchased the theater in the Haymarket from Mr. Foote. In 1785, he was attacked by palsy, and never recovered; he died Aug. 14, 1794. C. was an industrious author; besides poetry and translations, he wrote and adapted upwards of 30 dramatic pieces.

COLMAN, GEORGE, " the Younger," son of the preceding, was b. Oct. 21, 1762. His bent lay in the same direction as his father's, during whose illness he acted as manager of the Haymarket theater; and on the death of the elder Colman, George III. transferred the patent to his son. C. held, for a considerable time, the office of examiner of plays. In industry, he rivaled his father, and he received large sums for his dramatic writings, some of which continue in possession of the stage. He was twice married, and died on the 26th Oct., 1826. His last literary work was *Memoirs* published in two volumes.

COLMAN, HENRY, 1785–1849; b. Boston; graduate of Dartmouth; minister of a Congregational church at Hingham from 1807 to 1820; and from 1825 to 1831, Unitarian pastor in Salem. He was agricultural commissioner for Massachusetts, and published (after a trip to Europe) " *Agricultural and Rural Economy in France, Belgium, Holland, and Switzerland; European Agricultural and Rural Economy; European Life and Manners, in Letters to Friends;* and also reports on the silk culture, and on the agriculture of Massachusetts.

COLMAN, SAMUEL, b. Maine, 1832; an artist noted for American and foreign landscapes.

COLMAR, a city ceded to France in 1697, and repossessed by Germany since 1870, the capital of upper Alsace, stands on a plain near the Vosges, 41 m. n.n.e. of Strasburg. A stream of water from the Lauch and Fecht, at the confluence of which the town stands, flows through and keeps the streets clean. Among the principal buildings of C. are the cathedral, the Dominican church, the college, court-house, and town-house. C. is a busy place—one of the chief seats of the cotton manufacture in Alsace. Water, being abundant, is the principal motive power in driving the machinery, but steam is also employed to a considerable extent. Other manufactures are paper, leather, ribbons, and hosiery. C. is an old place, having been raised to the rank of a city in 1220. About the end of that century, it was made a free town, and rapidly became one of the most prosperous in upper Alsace. Fortified in 1552, its fortifications were razed in 1673 by Louis XIV. Pleasant boulevards now occupy their place. Pop. '75, 23,778.

COLNE, a t. in the e. of Lancashire, on a high ridge near the source of the Calder, a western branch of the Ribble, 32 m. n.e. of Manchester, at the junction of the Lancashire and Yorkshire and Midland railways. It has manufactures of cotton calicoes and mousselines-de-laine. Coal, slate, and lime abound in the vicinity. Pop. '71, 7,335. C is an ancient place, by some supposed to be the *Colunio* of the Romans. Many Roman coins have been found here. As early as the beginning of the 14th c., it was the seat of woolen manufactures.

COLOCO'LO, a large cat, native to the n. part of South America. It is wild and very ferocious, making great havoc among monkeys and other small animals.

COL'OCYNTH (Gr. *kolokynthis*), a well-known medicine, much used as a purgative, is the dried and powdered pulp of the *colocynth gourd, coloquintida, bitter apple*, or *bitter cucumber*, a globose fruit about the size of an orange, of a uniform yellow color, with a smooth, thin, solid rind. The plant which produces it, *cucumis* (or *citrullus*) *colocynthis*, is nearly allied to the cucumber (q.v.). It is common in Asia, Africa, and Spain, which last country supplies no small part of the C. of commerce. The fruit is gathered when it begins to turn yellow, peeled, and dried quickly either in a stove or in the sun. It is chiefly in the form of a dried extract that it is used in medicine. It owes its properties to a bitter principle called *colocynthine*, which is more or less abundantly present in the fruits of many of the gourd family. It is a curious fact, but to which there are many analogous, that the seeds of the C. plant, produced in the midst of its medicinal pulp, are perfectly bland, and they even form an important article of food in the n. of Africa. —The name false C. is sometimes given to the orange gourd (*cucurbita aurantia*), sometimes cultivated as an ornamental plant in our gardens, on account of its globose, deep orange fruit. The pulp of the fruit possesses the properties of C., but in a milder degree.

C. is generally administered in the form of pills, in which the extract is associated with aloes, scammony, and in some cases with calomel, or with extract of hyoscyamus. In small doses, the C. acts as a safe and useful purgative; and when accompanied by hyoscyamus, the latter prevents much of the pain and griping which are attendant on the use of C. by itself. In large doses, C. is a poison.

COLOC'ZA, or KALOCSA, a t. of Hungary, situated on the left bank of the Danube, 68 m. s. of Pesth. It has an archiepiscopal palace or castle, and a cathedral. Pop. '69, 16,302, who are chiefly engaged in the fisheries on the Danube, and in the breeding of cattle. There is a steam-packet station at Colocza.

COLOGNE' (Ger. *Köln;* the *Colonia Agrippina* of the Romans), a city and free port on the left bank of the Rhine, in lat. 50° 56′ n., long. 6° 58′ east. Formerly an independent city of the German empire, it is now the capital of Rhenish Prussia. C. is a fortress of the first rank, forming a semicircle, with the Rhine as its chord, and the town of Deutz on the opposite bank as a tête-du-pont. It is connected with this suburb by a bridge of boats, and a fine iron bridge 1362 ft. in length, for railway and carriage traffic. Pop. '71, 129,233, only 16,746 of whom were Protestants; (1875) 135,518. The streets are mostly narrow and crooked. The public buildings are numerous, including a number of educational and of charitable institutions. The church of St. Ursula is noted as the place where are preserved the bones of 11,000 virgins, companions of St. Ursula, who, according to the legend, were slaughtered at C. by the Huns, because they refused to break their vows of chastity. In the "golden chamber" are the coffin of the saint, and the skulls of a few of her most favored maidens incased in silver. The church of St. Gereon, the first portion of which was founded in 1066, boasts of the possession of the bones of St. Gereon, and of the 6,000 Theban martyrs slain during Diocletian's persecution. The church of St. Peter is celebrated for the altar-piece of the crucifixion of St. Peter by Rubens, and that of the Minorites for containing the tomb of the famous scholastic, Duns Scotus. The chief object of interest in the city, however, as well as its greatest ornament, is the cathedral, one of the noblest specimens of Gothic architecture in Europe. This cathedral is said to have had its origin in an erection by archbishop Hildebold, during the reign of Charlemagne in 814. Frederic, the red-bearded, bestowed upon it, in 1162, the bones of the three holy kings, which he took from Milan, and this gift contributed greatly to the increase of its importance. The bones are retained as precious relics to this day; but the old structure was burned in 1248; according to some accounts, the present cathedral was begun in the same year, but others fix the date of its commencement in 1270–75. To whom the design of this noble building is to be ascribed, is uncertain. The choir, the first part completed, was consecrated in 1322. The work was carried on, sometimes more actively, sometimes more slowly, till the era of the reformation, when it was suspended; and during the subsequent centuries, not only was nothing done to advance it, but what had been already executed, was not properly kept in repair. In the beginning of the present century, however, attention was directed to its unrivaled beauties, and it has since become the subject of an enthusiasm extending over all Germany, and which has given birth to a multitude of associations for the supply of the necessary funds to repair and complete it according to the original design. Funds have also been forthcoming from other parts of Europe. On Sept. 4, 1842, the king of Prussia, who had contributed largely to the funds, laid the foundation stone of the transept, since which time great progress has been made. The naves, aisles, and transepts were opened in 1848. The magnificent s. portal was completed in 1859, and the n. has also been finished; and in 1860, the iron central spire was added. With the exception of the towers, the whole was finally completed in Oct., 1863. The body of the church measures 500 ft. in length, and 230 ft. in breadth. The towers, when finished, will be upwards of 500 ft. in height. The cost of the restoration is estimated at £750,000.—The situation of the city is extremely favorable for commerce, and it has long possessed a considerable and increasing importance in this respect. Various branches of manufacture are carried on, of which the chief are the making of beet sugar, tobacco, glue, carpets, soap, leather, furniture, pianos, chemicals, and spirits of wine, besides the characteristic manufacture of eau-de-Cologne (q.v.). In 1876, 6,670 vessels and boats traded at the quays of Cologne. C. has extensive and important railway connections.—The city was founded by the Ubii, about 37 B.C., and was at first called *Ubiorum oppidum;* but a colony being planted here in 50 A.D. by Agrippina, the wife of the emperor Claudius, it received the name of *Colonia Agrippina.* At the partition of the Frank monarchy in 511, it was included in Austrasia; and by a treaty in 870, was united to the German empire. It entered the league of the Hanse towns in the beginning of the 13th c., and contended with Lübeck for the first rank. It was at a very early period the seat of a bishopric, which was elevated, in the end of the 8th c., into an archbishopric, and the archbishops acquired considerable territories, some of them distinguishing themselves as politicians and warriors. They took their place amongst the princes and electors of the empire, but were involved in a protracted contest with the citizens of C., who asserted against them the independence of the city, and the archiepiscopal residence was therefore removed to Bonn. The archbishopric was secularized in 1801, when the city also lost its independence, and the congress of Vienna did not attempt to restore to it its former character, but assigned the whole territories to Prussia. The archbishop, therefore has not now the political rights and power that belonged to his predecessors.

COLOGNE WATER. See EAU DE COLOGNE, *ante.*

COLOGNE YELLOW is a pigment composed of 2 parts of yellow chromate of lead, 1 of sulphate of lead, and 7 of sulphate of lime or gypsum.

COLOMBA'NO, SAN, a t. of n. Italy, in the province of Milan, on the right bank of the Lambro, about 10 m. s. of Lodi. It is situated in the midst of hills, in which are found porphyry, feldspar, and fine red granite, and also limestone containing numerous fossils. Pop. 6,000.

COLOM'BIA, immediately after the war of independence, was a term which embraced all that now belongs to the three republics of Venezuela, United States of Colombia, and Ecuador, being the entire n. of South America, and the extreme s. of what is geographically distinguished as Central America. Independently of the singular difficulties of communication, and of the resulting absence of anything like natural unity, this unwieldy state contained, from the beginning, the cause of its own dissolution in the national character of its inhabitants. So long as union was necessary to meet external dangers, C. maintained an imposing attitude in the eyes of the world; but, gradually, sectional interests and political jealousies did their work, and, at last, about 1830, the ill-assorted elements of the confederation were separated forever.

COLOMBIA, UNITED STATES OF, the official title, since 1861, of what was formerly called New Granada (q.v.).

COLOM'BO, the capital of Ceylon, an episcopal city and seat of government, is situated on the western side of the island, in 6° 59′ n. lat., and 80° 4′ e. long., near a rocky headland, the *Jovis extremum* of Ptolemy, by which the mariners of antiquity steered for the port of Galle. The modern fortifications of C., which were constructed by the Dutch, include, on the land-side, four bastions with counterscarps and ravelins, and, towards the sea, seven batteries. Except the military officers, few Europeans reside within the fort. Colpetty, a beautiful suburb, shaded by groves of the cocoa-nut palm, is a favorite retreat. Here, the houses are chiefly of one story, with broad verandahs. The large and lofty rooms are furnished with punkahs, floored with tiles, and, for the sake of air, have windows opening to the ground, at which, however, snakes, lizards, scorpions, and the teeming insects of a tropical country, make free to enter. The humble, mud-constructed dwellings of the Dutch, Portuguese, Eurasians, Singhalese, Tamils, Moors, and Malays are outside the city walls. The *pettah*, or Black Town, the only ancient quarter, extends to the river Kalany-ganga. Pop. '71, 100,238. C. is connected with Kandy by railway. The mean annual average of temperature at C. is 80° or thereabout, and has reached to 86° in extraordinary years. The annual fall of rain is 72.4 in., of which the greatest quantity is measured at the change of the monsoon, when it pours down in a perfect deluge. Out of 72.4 in., 20.7 fall in April and May, and 21.9 in Oct. and Nov.

The early name of C., Kalan-totta, the "Kalany ferry," so called from its proximity to the river, the Moors corrupted into Kalambu, and by this designation it was described about 1340 A.D. as the finest city of Serendib. At the arrival of the Portuguese, who fortified it in 1517 A.D., Kalambu had merged into Kolamba, or Columbu, which they henceforth wrote Colombo, in honor of Christopher Columbus. The Dutch succeeded to the Portuguese (see CEYLON), and C. was taken by the British 16th Feb., 1795.—Sir James Emerson Tennent's *Ceylon*.

COLOMBO ROOT, the root of an African vine, a mild tonic, containing columbin, berberine, and columbic acid, with starch and coloring matter.

COLON. See PUNCTUATION.

COLON, that portion of the large intestine which extends from the cæcum (q.v.) to the rectum, which is the terminal portion of the intestinal canal. Whether it is derived from *koilon*, "hollow," or *kōlao*, "I arrest" (because the fæces are retained for a considerable time in it), is uncertain. It is divided into the ascending, the transverse, and descending C., and the sigmoid flexure. See ALIMENTARY CANAL.

The whole length of the C., from its commencement in the cæcum, to its termination in the rectum, is rather more than four feet. It is retained in its position by the serous membrane, which envelops, more or less, all the intestinal viscera, and is termed the peritoneum (q.v.). Its structure is essentially the same as that of the rest of the intestinal canal, which is described in the article DIGESTION, ORGANS AND PROCESS OF; but in consequence of a peculiar arrangement of the longitudinal muscular fibers, the interior of the C. is divided into sacculi, which serve to retain its contents for a longer period than if it were a uniform tube, and thus by extracting water from them, to reduce them to a more solid consistence, such as is possessed by normal excrement. In some animals, as in the horse and sheep, the shape of the fæces is completely molded by these cells.

COLON. See ASPINWALL, *ante*.

COLONEL (from the Italian *colonello*, the leader of a column) is the highest officer of a regiment; any grade above this converts him into a general-officer belonging to the army collectively, rather than to any one regiment. Before the reign of Elizabeth the chief officer of an English regiment was capt., but in 1588 the title of C. had become familiar. In the British army at the present day, except in the artillery and engineers, the office of regimental C. is a sinecure, the real active commander of the battalion being the lieut.-col. The C. receives higher pay and dignity. The cols. are gens., who have had what is called a regiment "given to them," as a reward for long service, and virtually as a retirement. The pay, except in the guards (where it is higher), is £1000 a year. The army estimates provide for about 150 regimental (otherwise called "honorary") cols. of cavalry and infantry, and for about a sixth of that number cols. commandant in

connection with the artillery and engineers. There is a frequent outcry against these appointments when viewed as sinecures, but looked upon as retirements for deserving old officers there is little that is objectionable in them. The rank of C. was above those which were purchasable. See COMMISSIONS, ARMY. Apart from regimental rank there is the army or brevet rank of C., through which all officers must pass on the way to general-officer. It is attained by specified service in certain positions as lieut.col. In the Austrian, Prussian, and Russian armies, where the regiments are very large, the colonelcies are mostly honorary posts, held by emperors, kings, princes, and other distinguished persons.

COLONEL (*ante*). There is no material difference in the position of col. in the American as compared with the British army. The rank is between lieut.col. and brig.gen., and the extent of command is usually a single regiment.

COLO'NIA DO SANTIS'SIMO SACRAMEN'TO, a port of Uruguay or Banda Oriental, stands on the n. or left bank of the Plata, nearly opposite to Buenos Ayres, and about 100 m. above Montevideo, the capital of the state. The place is pretty regularly fortified. As its acquisition would tend to secure to Buenos Ayres the entire command of the interior navigation, the town was seized by Rosas, the dictator of that state; but, in the interest of the freedom of commerce, it was, in 1845, taken from him by the French and English squadrons.

COLO'NIAL CORPS were certain regiments forming part of the regular army of the British empire, and paid for out of the imperial revenues. They were never very fixed in number, varying with the circumstances of the colonies in which they were located. The following were the names of the corps, the numbers provided for in the army estimates for 1860–61, when these regiments were at their largest recent establishment, and the composition of each corps, whether British or native:

Three West India regiments (afterwards raised to five)	3,420	Negro.
Newfoundland Veterans	229	British.
Ceylon Rifles	1,585	Native.
" Invalids	163	Native.
Cape Mounted Rifles	1,084	Boers and natives.
Malta Fencibles	638	Native.
Canadian Rifles	1,106	British.
St. Helena Regiment	433	"
Gold Coast Artillery	351	Native.
Falkland Islands Company	37	British.
African Artillerymen	64	Native.
Hong-Kong Gun Lascars	88	"

These corps, comprising about 95 companies, had somewhat over 1000 officers, commissioned and non-commissioned, and about the same number of horses. All the corps were officered by British, except the Malta Fencibles. The Cape Mounted Rifles was a mounted infantry corps.

As the colonies obtained self-government, and the military theory of employing troops only in large bodies gained ground, it was considered as against imperial polity to maintain, out of imperial revenue, corps which were tied to one colony, and not available for the general defense of the empire. Accordingly the colonial corps have been gradually disbanded, and there survive only two West India regiments and the Malta Fencibles.

COLONIZATION SOCIETY, THE AMERICAN, an association organized in 1816 for the purpose of transporting free and manumitted negroes from the United States to Africa. In 1819, congress appropriated $100,000 in aid of the work, and the next year the society sent out the first colonists. Henry Clay was for a long time president of the society. The emancipation brought about by the war of the rebellion has rendered the legitimate work of the society of little importance, although its organization is still kept up.

COLONNA, CAPE (ancient *Sunium Promontorium*), a headland of Greece, forming the southmost point of Attica, in lat. 37° 38′ n., long. 24° 1′ east. Crowned by the ruins of a temple of Minerva, its summit rising about 270 feet above the water, Cape C. is a conspicuous and remarkable object from the sea. Sixteen white marble columns, from which the cape derives its modern name, are still standing.

COLON'NA, a village in central Italy, is noticed because it gives its name to the most celebrated and powerful of all the Roman aristocratic families—the Colonna—from which have sprung a pope, several cardinals, generals, statesmen, and noted scholars.

The C. palace, situated at the base of the Quirinal (Rome), is celebrated for its splendid gallery and treasures of art.

COLONNA, GIOVANNI PAOLO, lived in the latter part of the 17th century. He was chapel-master of St. Petronia at Bologna, and president of the philharmonic academy there. The school established by him produced many good musicians, one of whom was

Clari. His works are mostly for church services, and many of them are among the most remarkable compositions of the 17th century.

COLONNA, VITTORIA, the most celebrated poetess of Italy, a member of the above-named family, was the daughter of Fabrizzio Colonna, high-constable of Naples, at whose estate of Marino she was born in the year 1490. When four years old, she was betrothed to a boy of the same age, Fernando d'Avalos, son of the marchese de Pescara. At 17, they were married. After her husband's death in the battle of Pavia (1525), Vittoria C. found her chief consolation in solitude and the cultivation of her poetical genius. During seven years of her widowhood, she resided alternately at Naples and Ischia, and then removed to the convent of Orvieto, afterwards to that of Viterbo. In her later years, she left the convent, and resided in Rome, where she died in Feb., 1547. Her poems were chiefly devoted to the memory of her husband. Among them, the *Rime Spirituali* (Venice, 1548) are remarkable for truth of sentiment and enlightened piety. The most perfect edition of the poems of Vittoria C. was published by Ercole Visconti (Rom. 1844).

COLONNADE is the name given to a series of columns placed at certain intervals from each other, and arranged in various ways according to the rules of art and the order employed.

COL'ONSAY, one of the western isles of Scotland, off the s.w. part of the mainland of Argyleshire, in the wide entrance of the firth of Lorn, between the isles of Islay and Mull, with the small isle of Oronsay, at the s. end, separated by a narrow sound, which is dry at low water. C. and Oronsay are together 12 m. long from n.e. to s.w., and 1 to 3 m. broad. The surface is irregular, and composed of mica-slate, passing into chlorite-slate and clay-slate, and mixed with quartz-rock and limestone. Half the surface is cultivated. Pop. '71, 408. Next to Iona, C. contains the most extensive remains of religious edifices in the Western isles. On Oronsay stand a large stone cross and the ruins of a monastery founded by the lords of the isles in the middle of the 14th century.

COLONY (Lat. *colonia*, from *colonus*, a husbandman; the first inhabitants of a C. being generally people of agricultural pursuits). The term is loosely used to embrace various classes of distant territories subordinate to or dependent on a parent state. A C., however, properly means a body of people formed by migration to a distant region, where they support themselves by industry and the produce of the soil, and are under the protection and attached to the supreme government of the mother-country. Our colonies in Australia and North America, where the natives have either ceased to exist, or do not compete with the colonists for the ownership of the soil, are practical instances of the C. in this its proper sense; but there are many other dependencies of the British crown which deviate more or less from the true characteristics of a colony. Gibraltar and Malta, for instance, are mere fortresses, not affording a profitable emigration-field for a portion of our population, but, on the contrary, requiring that such inhabitants of the United Kingdom as reside there shall be specially remunerated for doing so. The support of these dependencies is justified by the warlike, not the economic policy of the country. On the other hand, territories have afforded profitable residences to our people without being colonies; the most conspicuous of this class is the British empire in Hindustan, where our people scarcely hold any land, or concern themselves in the occupation of agriculture, from which the term colonist is taken; but reside as the rulers and defenders of the native races. The ancient migrations of nations, by which our own islands, for instance, became peopled apparently in the first place by Celts, and next by Goths or Teutons, were not colonization in the fullest sense of the term, since the parent-country kept no control over the settlers, and afforded them no protection. The Greeks were a spreading people, carrying with them their genius and their language. They established communities in Asia Minor, on the coast of Africa, in Italy, and in France; for instance, Marseilles was a Greek town, founded by the inhabitants of Phocæa about six centuries before the Christian era. A close connection was maintained between these emigrant communities and the states from which they had removed. Still, however, none of these districts were colonies, according to the definition given above; and it was one of the many triumphs of the organizing genius of the Romans, to form the "C." according to its most perfect modern acceptation. The principle of responsibility to a central government was brought to its greatest perfection in the policy of Rome, and it was part of this policy that not only every conquered territory, but every district where Roman citizens settled, should be an integral part of the empire. The *colonia* was one of the municipal institutions of the empire, having its own governing corporation dependent on Rome. There were various grades of colonies—some where there was the high privilege of Roman citizenship, and others where the citizenship was of a humbler grade. Corresponding with the consuls in Rome, there were municipal officers in the colonies, representing, after the empire was formed, the old republican institutions—these were called sometimes *duumviri*, and sometimes *quatuorviri*—terms, the special application of which has been matter of considerable discussion. The Romans appointed men of very high rank to the government of their provinces or colonies—men who had held such offices as the consulship or prætorship at home, and were called proconsuls or proprætors. It was a feature of the sagacious jealousy of the Roman system, to limit their period of government, lest they should become independent of the empire, and estab-

lish separate states; and this idea is followed in the colonial system of the British empire at the present day.

After the fall of Rome, centuries passed before colonization recommenced; for the various tribes who devastated the empire were not connected with any parent state, and the Normans, who spread themselves over Europe at a later period, were utterly unconnected in the countries where they settled, with the government of the northern states whence they migrated. It is curious that not a trace of the genealogy of the Normans of England or France can be found anterior to their settlement in the latter country, so little connection did they preserve with the country of their ancestors. The Spanish and Portuguese were the first among modern European states to establish colonies. Their sovereign aimed not only at the restoration of the Roman empire in Europe, but at the creation of a new empire in America, which was looked on as the exclusive property of the Spanish crown. In carrying out this view, it was not so much that the people of the peninsula went to America, and had the necessary staff of civil and military officers sent to them by the parent state, as that great officers, with high rank and enormous salaries, were sent over to the new empire, and brought followers after them. The other governments of Europe—Britain, France, Holland, and the minor states—subsequently colonized in America and Africa, Denmark occupying the inhospitable shore of Greenland.

The earlier British colonies arose in the reverse order to those of Spain—the colonists went first, the dignitaries followed. Both Raleigh and Drake attempted to form settlements in America, but unsuccessfully. The British race there dates from the reign of James I. of England. The settlers were privileged companies, with royal letters-patent, but, in reality, they were independent; and as they were dissenters seeking a place of refuge from what they considered the grievances of the established church and the government, they took care not to convey the grievance with them, as they would have done had they been actually incorporated with the British empire. The northern colonists, indeed, acted as if they were a sort of private corporation, occupying their own territory according to their own taste, and considered themselves entitled to prohibit any person differing from their religious and political opinions from entering their boundary. In later times, the example of Rome was more closely followed, and it became the policy of Britain, that any land acquired by her subjects by conquest or occupation, should be deemed to be held by them for the crown. This was strongly exemplified in New Zealand, where a body of energetic and spirited adventurers had projected something like a new empire, of which they were to be masters. Some of them had purchased large territories for a musket, a barrel of powder, or a piece of red cloth, and thought it hard that they should not be entitled to retain the fruit of their fortunate bargains. The crown, however, stepped in, asserted a supreme authority over the colony, and readjusted all its territorial rights, with a view to doing practical justice both to the natives and the settlers. There are many evils incident to any attempts at independent colonization, among which the chief is the cruelty and rapacity which it is the nature of such private adventurers to exercise against aboriginal tribes, and even against any other communities weaker than themselves who happen to fall in their way. The British colonists of the American continent and islands in the 17th c. were robbers and pirates on a large scale, and became memorable in history by the name buccaneers. Colonists themselves, when they rightly appreciate their own interest, must see their advantage in the supremacy of the crown—or rather in that of the British parliament—for the crown is only properly supreme over a territory which has been taken by conquest from another civilized power. The supremacy implies a right to protection, much needed by small collections of men in distant regions; and it may be safely predicted, that had an independent body of British settlers established themselves in New Zealand, their C., when it rose to importance, would have been seized by France, or some other foreign power. After the example set by the United States, it is not likely that the supremacy will be continued after it ceases to be advantageous to both parties.

Many fallacies regarding colonies have been dispersed by the progress of political economy. It used to be thought that the support of colonies at any price was an advantage to our trade, since it is more profitable to trade with our colonies than with foreign countries, because, among other reasons, they can be compelled, by restrictions and monopolies, to take our goods while we take theirs, but other nations cannot, and may continue to sell to us without buying from us. We now know that the best trade for the country is that which the individual dealers in it find to be the best for themselves, and they will go where they can trade with most profit, whether to a C. or a foreign country. It was when the United States were rich and enterprising—not when they were our colonies—that we have driven the greatest trade with them. No doubt, there must always be two parties in trade; and let a nation be as energetic and enlightened as it may, it will have no foreign trade unless there be some other that can afford and is inclined to deal with it. If the population of the United States were displaced by red Indians, there would be a sudden collapse in the trade of Britain. For such a reason it is that we have an interest in seeing our own race—the most enterprising in the world—spread over its face. Every new British C. may be calculated on as a new market for our goods; and as a pecuniary speculation, it may be worth supporting a governor and a staff of officers to take charge of it.

COL'OPHON, an Ionian city of Asia, about 9 m. n. of Ephesus, and near the sea-coast. The river Ales, noted for the coolness of its water, flowed past it. It is not often mentioned in history, although the birthplace of several poets, Mimnermus, the elegist, among others, and even claiming to be the native city of Homer. The Greek proverb, "to put the colophon to it," meaning to terminate an affair, is said to have originated in the boast of the famous Colophonian cavalry, that their *charge* was usually the finishing stroke in battle. Hence, in old printed books, the conclusion, in which were stated the name of the author, and the place and year of printing, was called a colophon.

COL'OPHONY. See ROSIN.

COLOQUIN'TIDA. See COLOCYNTH.

COLOR, in art, means either the pigment employed to produce a certain effect to the eye, or the effect thus produced, i.e., the tint of a picture. In the former sense, it is treated of in this work under the names of the colors themselves. See CARMINE, CHROME, etc. In the latter sense, C. must be regarded by the artist not so much as the result of the application of one or more pigments separately, as of their use in the innumerable combinations of which they admit. Synonymous with C. in this sense is the word *coloring,* which has come to be employed as a substantive, indicating the results of the art of combining and applying colors in the imitative arts.

Infinitely various as are the tints exhibited in coloring, it is remarkable that they all result from the combination of the three simple, or, as they are called, primitive or primary colors—*red, blue,* and *yellow.* See SPECTRUM, LIGHT, etc. Compounded in various proportions, either in twos, or all three together, these three colors produce every hue in nature or in art, every tint that is physically possible. First, when combined in twos, they produce the three *secondary* colors—that is to say, blue and red make purple or violet; yellow and red, orange; blue and yellow, green. The grays and browns, again, are compounds of all three of the primary colors, in unequal and varying proportions.

COMPLEMENTARY COLORS are the colors or color which, with any color or colors mentioned, make up the three primary colors, which constitute white light. Thus, if the given C. be a primitive, its complementary C. is composed of the other two primitive colors; e.g., the complementary color of blue is orange = red and yellow. Again, if the given C. be a secondary, its complementary C. is the remaining primitive color. Thus, the complementary C. of green—blue and yellow—is red.

CONTRAST OF C. is either simple or compound. Each of the primitive colors forms a simple contrast to the other two. Thus, blue forms a simple contrast to red and to yellow. But if red and yellow be mixed together, the complementary C. to blue will be produced—viz., orange, which is the most powerful contrast that can be made to blue.

HARMONY OF C. consists in the preservation of the same character in a picture throughout, in so far as coloring is concerned. It is said to result from an equal distribution of the three primary colors, either pure or in composition; but such a rule, even if correct, is correct with so wide a latitude as scarcely to admit of practical application. The only method of attaining to a knowledge of harmony of C., is to train the eye by the observation of it as exhibited in nature. A southern sky will be found to harmonize with a southern landscape, and consequently, the colors of which the one is composed with those which compose the other. The experiment may be made by painting an Italian sky over an English landscape, when the want of harmony in the coloring will be at once apparent. The art of preserving harmony without sacrificing variety, resembles that of preserving light in shadow, and combining clearness with depth, which we have explained under CHIAR-OSCURO.

WARM AND COLD COLORS are terms derived from the corresponding sensations which they are supposed to produce. Blue is said to be a cold C., and orange a warm one, whereas red is neither warm nor cold. Without supposing color-blindness, however, it seems very possible to imagine that in this respect the same C. may, from association and other causes, produce different sensations on different persons.

A COLORIST is an artist in whose works success in color is the prominent excellence. The greatest colorists are Titian, Correggio, Paul Veronese, Rubens, and perhaps his pupil Vandyck. To say that these artists surpass Raphael, or even Leonardo da Vinci, in this respect, would probably be to say too much. But that they equal these greater artists in this, and in this respect alone, is a sufficient reason for their being known as colorists *par excellence.* The art of coloring admits of being transmittted to pupils to a greater extent than the highest branch of all.

COLOR, in optics. See LIGHT, CHROMATICS, SPECTRUM.

COLOR, a rhetorical term, which was adopted into the technical language of English pleading. Previous to the passing of the common law procedure act of 1852 (15 and 16 Vict. c. 76), it was a rule that pleadings in confession and avoidance, as opposed to pleadings by way of traverse, should confess the matter adversely alleged, to the extent at least of admitting some apparent right in the opposite party requiring to be encountered and avoided by the allegation of new matter. This was called giving C. to the

plaintiff's claim. All this curious subtilty, to which English lawyers till recently were in the habit of attaching so much value, was very properly set aside by the statute above referred to. This section which applies to *C.* is the 64th.

COLOR, in Heraldry. The colors used are generally red, blue, black, green, and purple; which are called gules, azure, sable, vert or sinople, and purpure. Tenne or tawny, and sanguine or blood-color, sometimes occur, but they are not common. Yellow and white, again, are not colors in the heraldic sense, but metals; they are called or and argent, and are always represented by gold and silver. It is a fundamental and invariable rule in blazon, not to put C. upon C., or metal upon metal; thus, if the field be of a metal, the bearing must be of a C., and *vice versâ*. The only exception is said to be the arms of Jerusalem, which were given to Godfrey of Bouillon, which are *argent, a cross potence or, between four crosslets of the same.* Apparent exceptions to this rule in common blazon are—1. Abatements or marks of cadency or difference, labels, crescents, batons, and the like; and 2. Extremities or adjuncts to animals, or other objects, such as tongues, claws, horns, etc.; but neither of these are regarded as independent bearings. Colors and metals, when engraved, are generally indicated by dots and lines: *or*, gold, by dots; *argent*, silver, is left plain; *gules*, red, is indicated by perpendicular lines from top to bottom; *azure*, blue, by horizontal lines from side to side; *sable*, black, by horizontal and perpendicular lines crossing each other; *vert*, by diagonal lines from right to left; *purpure*, by diagonal lines from left to right; *tenne*, by diagonal lines from left to right, crossed by horizontal lines; and *sanguine*, by lines crossing diagonally from left to right, and from right to left.

COLORA'DO (Sp. red), the name of a state and also of two rivers of the United States. The state is bounded on the n. by Wyoming and Nebraska, e. by Kansas, s. by New Mexico, and w. by Utah. Its area is 104,500 sq.m., and the pop. in 1870 was 39,864, in 1874 estimated at 120,000. The Rocky mountains intersect the state from n. to s., but it has large and fertile valleys. That of San Luis, in the s., is an immense well-wooded amphitheater, surrounded by mountains, with an area of 18,000 sq. miles. The mineral resources of C. are very great, and include gold, silver, copper, gypsum, coal, salt, iron, and limestone. Value of gold and silver product in 1875, $6,300,000. The chief rivers are the Arkansas, Grande del Norte, Grand Costilla, Yampa, and a fork of the Nebraska. Denver (the capital), Golden City, and Central City are the principal towns. C. was formed into a territory in 1861, and admitted into the union as a state in 1876.—Of the rivers named C., one is confined to the state of Texas, is 800 m. long, and falls into the gulf of Mexico. The other rises in the Rocky mountains, and enters the gulf of California, about lat. 32° 10′ n., and long. 114° 30′ w., after a course of 1200 miles.

COLORADO (*ante*), named from the Colorado river, meaning "red water." It is the the 38th and youngest of the states of the American union, admitted Aug. 1, 1876. It is bounded by arbitrary lines of lat. and long., 37° to 40° n. and 102° to 109° w., being about 280 to 380 m., and estimated to contain 106,400 sq. miles. It is n. of New Mexico, and e. of Utah, s. of Wyoming and Nebraska, and w. of Nebraska and Kansas, and lies on both sides of the Rocky mountains, on the head waters of the Platte and the Arkansas running e., of the Rio Grande del Norte going s., and the Colorado running west. Thus *C.* forms a conspicuous portion of the great mountain water-shed of the continent. The source of the Platte at Montgomery is 11,176 ft. above tide, and its fall in the short distance to Denver is 6,000 feet. The Arkansas rises 10,176 ft. above the sea, and rapidly falls to 7,877, in one place passing through a cañon with walls of 1000 to 1500 feet. The Rio Grande del Norte rises in the Sawatch (Sp. *Saguache*) range (a continuation of the Sierra Madre of Mexico), flows through San Luis Park into New Mexico, and forms the boundary between Mexico and the United States below El Paso, about 32°. The largest of the head streams of the Colorado are the Bear, White, Bunkara, Gunnison, San Miguel, and Dolores. None of these streams are navigable. The only lake in C. of any consequence is that of San Luis, in the s. part of the state; about 60 m. long, with a quarter of that width. This lake receives nearly 20 streams of various sizes, but has no visible outlet. It lies in a highly picturesque region in the center of San Luis Park.

C. is traversed from n. to s. by the Rocky mountain chain, known by various names according to location or direction. The Sawatch range is a mass of solid granite averaging 13,000 ft. high, and presents a bold and conspicuous outline. The width of this range is from 15 to 20 miles. Among the peaks, somewhat closely grouped, are Bowles, 14,106 ft.; Howard, 14,208; La Plata, 14,126; Elbert, 14,150, and Grizzly peak, 13,786; Massive mountain, 14,192. The range is then comparatively low for 18 m. to the n., but again rises in the terminal peak of the Holy Cross (13,478 ft.), so named because the snow in the ravines near the summit presents that figure to the eye. The Elk mountains strike off from the Sawatch range in a s.w. direction for 30 m., and are interesting to geologists for the remarkable displacement of strata of which they are composed and the apparent confusion to which this condition has given rise. The more noteworthy peaks are Italian mountain (13,431 ft.), so named because it shows the colors of Italy—red, white, and green; White rock, 13,847; Tecalli, 13,274; Crested Butte, 12,014; Gothic, 12,491; Snow Mass, 13,961; Maroon, 14,000; Castle peak, 14,106; Capitol, 13,992; White House, 14,000; and Sopris, 12,972. Of less importance are the Uncom-

paghre in the s.w., the Raton in the s., and the Wet mount in the s.e. The eastern mountains which abut on the region of the plains are called the Front range. These mountains rising along the border line present in their rough and precipitous faces the strong, bold outlines produced by the metamorphic rocks, the granite, gneiss, and the shists; while the sedimentary rocks at their bases—the limestones, shales, slates, clays and chiefly sandstones—present a different appearance. These sedimentary rocks at their point of contact with the granites are not horizontal, but have been turned up on end by the force exerted by the granite mass against which they were deposited, when it lifted them to their present positions. Their slope to the e. from this point is nowhere more than 60°. They form the basis of the great plain, and were once the bed of the sea, which, on receding, left those thousands of feet of sediment to be carved out and carried off by the ice and water, which have left such wonderful traces of their power. The first feature of the lowlands is the low series of hills of a very even line of elevation, forming a sort of horizon or belt near the foot of the mountains, cut at intervals by the streams which descend from the hills. The ends of these hills that overlook the streams, being afterwards rounded, give each section a long, gently curved line at its upper surface, which has earned for them the name of "hogbacks." They seem to be a natural boundary line between the two geological systems here brought together. It is now believed that the sedimentary rocks, the ends of which are now exposed to view along the eastern side of this valley, must have extended very much farther into the mountains, and that after the elevation of their mass they were partly removed by erosion. The thickness of these layers is given by Dr. Hayden's surveys at 7,000 feet.

About half-way between Denver and the "garden of the gods" is the divide which separates the waters of the Platte from those of the Arkansas. This elevation of a little over 1000 ft. above Denver controls the flow of the tributaries of those streams until they reach the open plains to the n. and s. of this point, when they take the direction of the long gentle slope to the east. To the s. of this divide the peculiar, almost monumental uplifts of rock increase in number until the "garden of the gods" is reached, which owes its name to the grand display of these objects at that place. These monuments seem to have been formed in several ways, principally, however, by erosion; these isolated parts have been left because they were either of harder material than that surrounding them, or more able to resist meteoric shocks. They seem to be an aggregation of quartz and pebbles loosely held together in a nearly circular condition, which tapers from the thick base toward the top. This shaft is surmounted by a cap of rust-colored sandstone, which owes its greater size to the oxide of iron that forms a cement, binding the grains together. The smaller monuments here described vary in height from 10 to 20 feet. There are also the castellated forms of the larger table buttes or "mesas." These massive objects are from 100 to 250 ft. in height, and are sometimes capped with a layer of purple porphyritic basalt. They rise from the beautiful green meadows, and their almost perpendicular sides give them an appearance which is particularly impressive at sunset.

The famous South Park covers an area of 1200 sq.m., with a general elevation of 8,000 ft., rising at times to 10,000 feet. It is surrounded by mountains, the bases of which bear marks of its having been the bed of a lake. The valley of the Arkansas, a hundred miles cut through the mountains to Poncho pass, with a width of 8 to 10 m., affords one of the finest fields for the study of glacial action in the west. At first the valley must have had a huge glacier running from n. to s. through its length, as there are still traces of such a glacier in the markings on the sides of the mountains and in the drift matter on its slopes. Then part of this valley formed the bed of a large lake, as is shown by the deposits in the bottoms where they are exposed. This lake occupied the lower half of the valley, and when it was drained off through the opening now traversed by the Arkansas river the heavy and coarse material at the upper end and the finer drift matter at the lower end were exposed. The valley has many rounded oblong hills, which are covered by débris and range in height from 500 to 700 feet. After this first large glacier came others, which might be called secondary, and occupied the beds of the present tributary streams of the Arkansas. Each one of these is marked by large moraines, and where exposed the glaciation is magnificent. The masses of rock which have been transported by these agencies are incredibly large, often reaching 100 ft. in diameter. This whole valley must have been occupied by a glacier of from 1000 to 1500 ft. in depth. The terminal moraines of this glacier are remarkable for their size. Everywhere the traveler is hindered in his journey by mounds, ridges, basins, and bowlders, the latter often from 20 to 50 ft. in diameter. Worn rocks are also exposed, showing the effect of ice on their surfaces. San Luis is the largest of the parks, and is in the central s. part of the state between the Wasatch and the Eastern ranges. This region is the lowest land in the state, and is exceedingly fertile. It is watered by the tributaries of the Rio Grande, and has a delightful climate. Crossing the Rocky mountains to the n. we reach South Park (above described). Further on is Middle Park, somewhat larger and higher, and still further is North Park, the last of the series—the whole four parks extending in a line n. and s. through the middle of the state. All these parks are walled by high mountain ridges; are of varied surface, no considerable amount being level; are exceedingly fertile, and have dense pine forests where elk, bear, and

deer are still in abundance. Here and there are found mineral springs, and in Middle Park there are hot sulphur springs which are medicinally valuable.

C. has a remarkably regular and salubrious climate. The days are sometimes hot, but the nights are cool and without dews. The cold, except on the heights, is seldom severe, and it is rare to find the mercury down to zero. Snows are heavy and lasting on the mountains, but in the lower levels it is seldom deep, and very soon melts away. The dry atmosphere is so pure, that fresh meats are preserved by the simple process of drying. The late summer is almost rainless. The climate and air of C. are considered to be of great benefit to asthmatic and pulmonary sufferers, and the charming parks are likely to become the great natural sanitaria of North America. The various mineral springs are also adjuncts to the remedial nature of the climate. There are chalybeate, soda, and sulphur springs; and Manitou, where they are of soda, is already a considerable watering-place.

C. is very rich in minerals, gold and silver being the most important. Iron is also widely diffused, and zinc and copper are found. There is coal in abundance. The value of gold sent to the mints from C. up to Dec., 1878, was $30,000,000, and of silver, $16,000,000. The product of both in 1878 was about $8,800,000.

Agriculture is growing rapidly. About half the land, except the mountains, is available, and the best grains are corn, wheat, rye, oats, and buckwheat. Root vegetables thrive remarkably, an acre of potatoes producing 500 bushels. Small fruits are raised, and grapes are abundant and of superior quality. Natural grasses thrive luxuriantly, and in most parts pasturage lasts all winter, so that C. will doubtless rank high for raising cattle and wool. There does not seem to be a great variety of trees, the pines, cedars, cottonwoods, firs, and kindred growth, forming most of the forests. Of flowers, the state has immense profusion. "The color of the landscape," says one traveler, "is green and flowers in summer, and yellow and flowers in winter—but always flowers." Among the pests of agriculturists are poisonous weeds, which in a few districts render the land useless for cattle; but a greater torment is the grasshopper, the ravages of which are in some seasons almost ruinous. To this pest must be added the Colorado beetle, or potato bug, which has not only devastated this and neighboring states, but carried its war upon the potato to and beyond the shores of the Atlantic.

Denver is the principal city and the capital of the state. Elections are biennial; the legislature meets biennially; senators are chosen for four years, and assemblymen for two, and both are paid $4 per day for sessions limited to 40 days. The first vote for president will be given in 1880. The young state has not much of a history. That portion n. and e. of the Arkansas river and the Rocky mountains was a part of the Louisiana purchase; and the remainder came from Mexican territory ceded after our war with that country. Up to 1861, the territory was divided among the adjacent organized territories of Utah, New Mexico, Kansas, and Nebraska. In 1861, C. was organized as a separate territory. The early Spanish gold-hunters doubtless visited C. in the 16th c., but no settlements were made until within the past quarter of a century. About 1806, maj. Pike led a government exploring expedition into the region, leaving his memory in the name Pike's Peak, a high mountain near the geographical center of the territory. Subsequently, about 1820, another party under col. Long, of the United States engineers, had some travel in C.; and in 1843, capt. John C. Fremont, "the path-finder," made full examination of the northern part. The discovery of gold in 1858, on the Platte, near the present city of Denver, started a flood of immigration, which was but little checked even during the rebellion. Towns sprang up as easily as in the Arabian stories. Denver, Golden City, Central City, Nevada, etc., started within a year, and the next year bore a large crop of these improvised "cities." The struggle with the rebellion and one severe Indian war had somewhat interfered with the growth of C., but, with all drawbacks, its progress has been very rapid.

There were 7 daily, 1 semi-weekly, 43 weekly newspapers, and 1 monthly magazine published in C. at the beginning of 1879. The latest statistics of education show 26,473 persons of school age (6 to 21); 16,641 pupils enrolled; 9,700 average attendance; 100 school-days in the year; 567 teachers; income, $281,674; expenses, $243,850. There is a normal department in the state university, at Boulder. There is a school of mines at Golden, a mining institute at Colorado Springs, and there is soon to be an agricultural college. The state university in 1878 had 66 students; there is an institution for deaf mutes at Colorado Springs, and at the same place Colorado college (Cong.). The school lands amount to 3,740,000 acres.

The railroads in C., finished and in progress on the 1st of Jan., 1879, were: Denver and Rio Grande, from Denver to El Paso, Texas, 339½ m.; Pueblo and Arkansas Valley, 230 m.; Colorado Central, from Golden to Cheyenne, Wyoming Ter., with a branch to Denver, 184¾ m.; Kansas Pacific, Pueblo to Kansas state line, 194 m.; Denver Pacific, from Denver to Cheyenne, 96 m.; Denver, South Park and Pacific, from Denver to Webster, 78½ m.; and Denver and Boulder Valley, from Hughes to Boulder City, 27 miles.

The framers of the constitution of C. provided against the evils of special legislation very carefully. Sec. V. says: "The general assembly shall not pass local or special laws in any of the following cases: For granting divorces; laying out, opening, altering, or working roads or highways; vacating roads, town plots, streets, alleys, and pub-

lic grounds; locating or changing county seats; regulating county or township affairs; regulating practice in courts of justice; regulating the jurisdiction and duties of justices of the peace, police magistrates, and constables; changing the rules of evidence in any trial or inquiry; providing for changes of venue in civil or criminal cases; declaring any person of age; for limitations of civil actions or giving effect to informal or invalid deeds; summoning or impaneling grand or petit jurors; providing for the management of public schools; regulating the rate of interest on money; the opening or conducting of any election, or designating the place of voting; the sale or mortgage of real estate belonging to minors or others under disability; the protection of game or fish; chartering or licensing roads or toll-bridges; remitting fines, penalties, or forfeitures; creating, increasing, or decreasing fees, percentage, or allowance of public officers; changing the law of discount; granting to any corporation, association, or individual the right to lay down railroad tracks; granting to any corporation, association, or individual, any special or exclusive privilege, immunity, or franchise whatever. In all other cases where a general assembly law can be made applicable, no special law shall be enacted." Women are recognized in affairs of education, and can vote at school district elections, and hold school offices. The legislature may make education compulsory. (For latest statistics, see Appendix.)

COLORADO, a co. in s.e. Texas, on the Colorado river, reached by the Buffalo Bayou, Brazos, and Colorado railroad; 905 sq.m.; pop.'80, 16,673—7,692 colored. The region is fertile and heavily wooded; productions, corn, cotton, sweet potatoes, etc. Co. seat, Columbus.

COLORADO POTATO BEETLE, *Doryphora decemlineata*, a small beetle, which, since 1861, has done great harm to the potato crops of the United States. It is of a yellowish cream-color, with ten black lines running down the wing-covers. The *larvæ*, which do the principal mischief, are at first reddish-brown, and get paler with increasing age.

COLORADO RIVER, in Texas, rising near the New Mexican boundary and flowing s.e. through nearly the whole breadth of the state, emptying into Matagorda bay. It is about 900 m. long, and in winter is navigable by steamboats to the city of Austin, the capital of the state.

COLORADO, or Cobu Leubu, RIVER, rising in the Andes, and flowing s.e. through a portion of the Argentine Republic to the Pacific. It is about 600 m. long, and is said to be navigable for 120 m.; but it flows through a region of which little is known.

COLORADO RIVER, or Colorado of the West, a large river rising in Utah, and flowing s. and w. through Utah and Arizona, and between Nevada and California and Arizona. The Colorado is formed by the junction of the Green and the Grand rivers of Utah in lat. 38° north. The main tributaries of the Colorado are from the e., and include the San Juan, the Little Colorado, and the Gila. After leaving United States territory, the Colorado flows s. between the Mexican provinces of Lower California and Sonora, and discharges its waters into the extreme n. point of the gulf of California. The length of the Colorado, reckoning from the sources of Green river, is about 2000 miles. It is navigable for steamers a little over 600 m., nearly to the foot of the Grand cañon. There is a good harbor near the mouth of the river, used mainly by vessels in the Colorado trade. The remarkable features of this river are its cañons, which extend for more than 500 m. along its course. The most notable, and in itself a great wonder, is more than 200 m. long, with walls quite or nearly vertical, varying from 4,000 to 7,000 ft. high. The channel of the river is in some places 100 yards wide, and then perhaps suddenly narrowed to less than 20 yards. The fall of the stream is from 5 to 200 ft. in a mile, and the deep gloomy gorge is full of whirlpools and waterfalls. Below the cañons there is a valley from 2 to 8 m. wide, of fertile soil. In 1867, the cañons were descended by James White, the sole survivor of a party prospecting for mines. He escaped through them from hostile Indians, and floating on rafts of driftwood, came out scarcely alive. Again, in 1869, prof. J. W. Powell, with a corps sent by the United States government, explored the cañons through their whole length, suffering great hardships, and often narrowly escaping with life.

COLOR-BLINDNESS, a term introduced by sir David Brewster to denominate a defect of vision, owing to which certain persons are either unable to discern a single color, such as red, or to distinguish between two colors, such as green and red, so that they may be said to be blind to red, or to be blind to one of two colors presented simultaneously to the eye. This defect has been called *chromatopseudopsis*—i.e., false vision of colors; Daltonism, after Dalton the chemist, who suffered under it; and various other learned names, have been applied to it; but color-blindness seems to be as apt and expressive a name as any. It occurs in eyes whose power of vision, as to form and distance, is otherwise perfect. The late Dr. George Wilson, whose work on this subject should be consulted by the reader (*Researches on Color-blindness*, Edin. 1855), thus classifies the varieties of the defect: 1. Inability to discern any color properly so called, so that black and white—i.e., light and shade—are the only variations of tint perceived. 2. Inability to discriminate between the nicer shades of the more composite colors, such as browns, grays, and neutral tints. 3. Inability to distinguish between the primary

colors, red, blue, and yellow, or between these and the secondary and tertiary colors, such as green, purple, orange, and brown. The first sort would appear to be very rare, but well-marked cases of it are on record, and show that insensibility to colors is not only compatible with distinct vision in other respects, but is frequently attended by a greater power than is usual of perceiving objects very faintly illuminated. None of these recorded cases, however, have been examined with such care as to warrant the conclusion that the color-blindness was absolute. It would appear that where the color-blindness is nearly absolute, degrees of luminosity supply the place of shades of color in giving variety to the aspects of objects. The second variety of color-blindness, where the nicer shades of the more composite colors are mistaken, would appear to be very common—the rule rather than the exception in the majority of persons, at least of the male sex, in this country; but it is a matter of doubt how far it may not be referable to imperfect cultivation of the sense of color. In many cases of this kind, however, it can be shown that the defect differs in degree only from that of the third form. The third form is the most important variety of the affection. In extreme cases, although colors are occasionally quite correctly named, there is no certainty as to any color: in less severe cases, two colors, at least, as red and green, and generally four, as red, green, olive, and brown, are not distinguished from each other. Yellow would appear to be the color which gives least difficulty to those not absolutely unconscious of color; while blue, if pure and well illuminated, is readily recognized by the color-blind, a few of whom, indeed, describe it as the color which they see best. Red appears to be the color the want of the sense of which may be said to characterize all the color-blind. Indeed, Dr. Wilson thinks color-blindness might properly enough be called *anerythric* (no-red) vision. He says that while the normal eye analyzes white light into three colored elements, one of which is *red*, the color-blind eye, on the other hand, analyzes white light into two elements, neither of which is red.

The eyes of persons having this defect of vision have been carefully examined after death without the discovery of any peculiarity. Color-blindness therefore has its seat in the sensorium, not in the visual apparatus.

Color-blindness would appear to be very prevalent. Of 1154 persons, of various professions, examined in 1852 and 1853 at Edinburgh by Dr. George Wilson, 65, or 1 in 17.7, were color-blind; 21 confounded red with green; 19 confounded brown with green; and 25 confounded blue with green. In consequence of this prevalence of the defect, the investigations into its nature are of the greatest practical importance. Railway officials, for instance, should always be tested for it, lest, being color-blind, they should mistake the various signals in use on lines of rail, and thus cause accidents.

Sir David Brewster, sir John Herschel, prof. Maxwell, and many others, have written on the subject of color-blindness. Perhaps the most ingenious investigator of color-blindness, and the phenomena of vision generally, is prof. Maxwell, whose writings thereon in the Transactions of the Royal Societies of London and Edinburgh, will well repay perusal.

COLOR-GUARD, in the infantry, is a guard of eight corporals and the color-bearer in each regiment. They are attached to the right center company in the line.

COLORING, as a musical term, is applied to those passages and harmonic progressions in bravura airs affording the singer an opportunity of display. It is also applied to all grand harmonic combinations in orchestral compositions.

COLOR-PRINTING. See POLYCHROME PRINTING.

COLORS, THE DIATONIC SCALE OF. Sir Isaac Newton, when investigating the properties of light, discovered that the lengths of the spaces occupied in the spectrum (q.v.) by the seven so-called primary C., exactly correspond to the lengths of chords that sound the seven notes in the diatonic scale of music. Hence the phrase, *the diatonic scale of colors.*

COLORS, MILITARY, are certain kinds of flags carried with the army. Standards, banners, pennons, guidons, ensigns, colors—all are military flags, each originally having a distinct meaning, now to some extent departed from. The ensigns were the original of those which are now called C., and which especially belong to infantry regiments. The C. are square flags, larger than the standards carried by the cavalry. In former times, there was one for each company; but now there are generally two for a battalion, constituting "a pair of C.;" one of which is called the royal or first, and the other the regimental or second. Both are about 6½ ft. by 6, made of silk, with cords and tassels of crimson and gold, and fixed to a staff about 10 ft. long. The royal color or flag is nearly alike for all the regiments; with a blue ground, an imperial crown, the number of the regiment, and the union cross of St. George, St. Andrew, and St. Patrick. The regimental C. depends for its tint on the facings of the uniform of the regiment; in its center is inscribed the number or designation of the regiment, with its crest and motto, if any; and around are the names of the victories and campaigns in which the corps has served. A subaltern officer carries the colors, and certain non-commissioned officers are set apart as a guard. The C. symbolize the good name and fame of the regiment, and are on that account protected in action with sedulous care; a victor always counts among his achievements the number of C. captured from the enemy. When a regiment obtains new C., they are usually solemnly presented by some lady of distinction.

The presentation is made with much military pomp, and the chaplain of the regiment reads a prayer prepared for the occasion. A member of the heralds' college is "inspector of regimental colors," the post being at present held by garter-king-at-arms.

Besides the "pair of C.," there are small *camp* C., of the same tint as the facings of the regiment, to designate the part of the camp the corps occupies. Rifle regiments do not carry colors.

COLOR-SERGEANT, in the army, is a non-commissioned officer of higher rank and better pay than the ordinary sergeants. There is one to each company of infantry; and the office is specially given to meritorious soldiers. The color-sergeant wears an honorary badge over the chevrons (q.v.), and receives 2*s.* 5*d.* per day. He fulfills the ordinary regimental and company duties of sergeant; but in addition to these, he attends the colors in the field, or in the front of a camp, or near headquarters in a garrison. A color-sergeant may be degraded to the rank of sergeant for misbehavior, but only by the decision of a court-martial.

COLOS'SÆ, a populous city of ancient Phrygia, on the river Lycos. Its inhabitants were noted for their skill in dyeing wool. C. was almost entirely destroyed by an earthquake, 65 A.D. To the Christians of C., Paul addressed one of his epistles.

COLOSSEUM. See AMPHITHEATER.

COLOSSIANS, EPISTLE TO THE, is proved by external testimony and internal evidence to be a genuine production of the apostle Paul, and as such has been universally acknowledged except by a few modern critics who oppose but cannot overturn the general judgment. From the epistle itself it is plain that Paul wrote it when he was a prisoner; but whether at Rome or Cæsarea has been strenuously debated. While the internal evidence is perhaps evenly balanced for each place, the testimony of tradition is decided that the epistle was written at Rome. If that view be correct, its date is about 62 or 63 A.D. Another question much disputed is whether or not the church at Colossæ was founded by the apostle Paul. On the negative side the chief argument is derived from Paul's declaration concerning his anxiety "for the Colossians, Laodiceans, and all who had not seen his face." From this the conclusion is drawn that the Colossians were a part of those who had not seen him. On the affirmative side it is urged: 1. In reply to the preceding argument, that Paul's language, may fairly be interpreted to mean that his anxiety was for the Colossians and Laodiceans who knew him, and for the great multitude in addition who had never seen him. 2. That as it is stated in Acts that Paul went through Phrygia twice, preaching the gospel and revisiting the disciples, it is not probable that he passed by Colossæ and Laodicea, two of its important cities. 3. That his friendship for many prominent Christians at Colossæ, the cordial relations which existed between him and the church there, and his intimate acquaintance with their affairs, almost require the supposition that he had introduced the gospel among them. The epistle was probably written to counteract certain false teachings and tendencies which had appeared in the church and were, as Neander thinks, a combination of oriental theosophy and asceticism with Christianity in the effort to obtain a deeper insight into the spiritual world and a nearer approach to purity and intelligence than simple Christianity could yield. Such an effort was especially natural in Phrygia, the land of mystic rites and magical superstitions; and it is remarkable that in the 4th c. the council of Laodicea found it necessary to forbid angel worship, which had held its ground in that region. But in Paul's day the errors were only beginning to spring forth, and he opposed them by showing that in Jesus Christ Christians have all that they require; that he is the image of the invisible God, exalted above the angels, the creator and upholder of all things; that all Christians are complete in him and will be presented by him perfectly holy and unblamable before God if they continue steadfast in the faith; that while the prescriptions of a mere carnal asceticism are not worthy of their regard, there are high principles which should guide their consciences, and important duties which should govern their lives. The epistle so closely resembles that to the Ephesians, in doctrine, style, and manner, that a careful comparison of one with the other will greatly promote a correct knowledge of both.

COLOS'SUS, a Greek word of unknown origin, used to denote a statue very greatly beyond the size of life. In English, the adjective colossal is used in a somewhat wider sense, to denote all statues which exceed the size of life, in however small a degree. Most statutes are thus colossal, though of colossi, very few have been erected in modern times. The "Bavaria" (q.v.) at Munich is perhaps the only very celebrated example. The colossal was the peculiar characteristic of Egyptian art, and innumerable colossi were raised in Egypt, mostly of the hardest stone, many of them 50 to 60 ft. in height. The most celebrated is the vocal statue of Memnon (q.v.) in the plain of Thebes, described by Strabo and Pausanias, and supposed to be identical with the more northerly of the two existing colossi on the w. bank of the Nile. But it was in the artistic world of Greece that the most famous colossi appeared: e.g., the bronze statue of Pallas Athene, on the acropolis of Athens, the plume of whose hemlet and the point of whose spear were landmarks to sailors between Sunium and Athens; another statue of the some goddess, of gold and ivory—the so-called Palladium in the parthenon at Athens; and the Olympian Jupiter, of the same material, the masterpiece of Phidias, who was

also the author of the two statues just mentioned. Amongst the seven wonders of the old world, was reckoned the gigantic C. of Rhodes, representing Phœbus, the national deity of the Rhodians. It is said to have been commenced by Chares, of Lindus, a famous pupil of Lysippus, and terminated by Laches. They formed it of metal, which was cast in separate pieces, a process which lasted for 12 years, and was completed 280 B.C. Its height is doubtful—some making it 90 ft.; others 90 and even 105 cubits. It cost 300 talents. Sixty years after its erection, it was thrown down by an earthquake. The Romans imitated the Greeks in the erection of these gigantic structures. The statue of Jupiter upon the capitol, made from the armor of the Samnites, was so large that it could be seen from the Alban hills. Then there was the bronze statue of Apollo, of which what is supposed to be the head is now in the capitol; a bronze statue of Augustus, in the forum; a C. of Nero, executed in marble, of the enormous height of 110 or 120 ft., from which the contiguous amphitheater is believed to have derived the name of "colosseum;" an equestrian statue of Domitian, in the center of the forum; and many others.

COLOSTRUM is the term applied to the first milk yielded after delivery. In differs very materially from ordinary milk, and generally appears as a turbid, yellowish, viscid fluid, similar to soap and water. When examined under the microscope, it is found to contain, in addition to the ordinary milk corpuscles (see MILK), peculiar conglomerations of very minute fat granules, which are hence known as C. corpuscles. The chief chemical difference between C. and milk is, that the former contains nearly three times more salts than the latter. It is probably this excess of salts that usually causes it to exert a purgative effect upon the new-born infant, and thus to remove the meconium (q.v.) which had accumulated in the fetal intestine.

COLQUITT, a co. in s.w. Georgia, on the Withlacoochee river; 600 sq.m.; pop. '80, 2,527—105 colored. The region is level, and the chief productions are agricultural. Co. seat, Moultrie.

COLQUHOUN, PATRICK, 1745–1820; a Scotch author, chief magistrate of Glasgow, and for years a police magistrate in London. His works are *A Treatise on the Police of the Metropolis; A New System of Education for Laboring People; A Treatise on Indigence;* and *On the Population, Wealth, Power, and Resources of the British Empire.*

COLSTON, EDWARD, 1639–1721; a native of Bristol, England, successful in trade in the West Indies and elsewhere, and the accumulator of a large fortune, much of which he gave to the establishment and support of charities, especially in founding and sustaining almshouses and schools. He was a strong tory and a high churchman, intolerant of dissent and dissenters. He was three years in parliament.

COLT, SAMUEL, 1814–62; b. Hartford, Conn., where his father had a manufactory of silks and woolens. At the age of 14, Samuel ran off to sea and made a voyage to India, in the course of which he made a wooden model (said to be still in existence) of a revolving pistol, the forerunner of the "Colt's revolver." After the voyage, he applied himself to the study of chemistry, and lectured on that science in the United States and Canada. In 1835, he visited Europe and patented his invention in London and in Paris, and on his return secured American patents. In the same year, he founded the Patent Arms company for the manufacture of revolvers only. The scheme did not succeed, the revolver was not appreciated, and in 1842 the company became insolvent; no revolvers were made for five years; and none were to be had when gen. Taylor sent from Mexico for a supply. The government then ordered 1000 to be made, and this commission was the foundation of the inventor's wonderful success. The little factory at Whitneyville, where the first order was filled, gave way to larger and larger buildings, until his manufactories came to exceed in size and importance any establishment for the making of arms in the country. Not only pistols but rifles are made, with all the accessories of such weapons; balls, cartridges, bullet-molds, powder-flasks, etc. He was also the inventor of a submarine battery for harbor defense, and of a method of insulating submarine telegraph cables.

COLTON, CALEB CHARLES, 1780–1832; an English writer, a graduate of Cambridge, and a vicar. In consequence of his passion for gambling, he fled to the United States, but afterwards went to Paris, where he was correspondent for a London journal. He committed suicide through dread of a surgical operation which had become necessary to save his life. His works are *Hypocrisy, a Satirical Poem; Napoleon,* also a poem; *Lines on the Conflagration of Moscow;* and *Lacon, or Many Things in Few Words.* The *Lacon* enjoyed remarkable popularity. He edited a newspaper in Washington, advocating the election of Clay for president; and published *Life and Times of Henry Clay; Public Economy for the United States; The Genius and Mission of Protestant Episcopal Churches in the United States;* and edited Clay's speeches.

COLTON, CALVIN, LL.D., 1789–1857; b. Mass.; graduated at Yale, and studied theology at Andover. He was ordained in 1815, and took charge of a Presbyterian church in Batavia, N. Y., but his voice failed, and he left preaching for work as a newspaper correspondent, writing letters from England. On his return he published *Four Years in Great Britain.* About 1835, he took orders in the Episcopal church, and published *Thoughts on the Religious State of the Country, and Reasons for Preferring*

Episcopacy. He soon returned to secular literary work, and wrote a series of whig arguments called the *Junius Papers.*

COLTON, WALTER, 1797–1851; b. Vt.; graduate of Yale and Andover, and professor of moral philosophy and belles-lettres at Middletown, Conn. He was for many years a chaplain in the navy, and while in the service he gathered materials for *Ship and Shore in Madeira, Lisbon, and the Mediterranean; Visit to Athens and Constantinople; Land and Lee in the Bosporus and Ægean;* and *Notes on France and Italy.* He was on the Pacific station at the beginning of the war with Mexico, and in 1846 acted as alcalde of Monterey. He built the first school-house and started the first newspaper in California, and a letter of his to a Philadelphia newspaper made the first public announcement in the United States of the discovery of gold at Sutter's Fort. Some years later he returned to Philadelphia, and published *Deck and Port,* and *Three Years in California.*

COLT'S-FOOT. See TUSSILAGO.

COLT'S REVOLVER. See PISTOL, REVOLVER.

COLU'BER, a genus of serpents which, as defined by Linnæus, included an extremely miscellaneous assemblage of species, venomous and not venomous, agreeing only in the character of having a double row of plates on the under side of the tail. The venomous species are now excluded, not only from the genus C., but from the family *colubridæ,* of which it is the type. The serpents of this family are very numerous: it includes, indeed, about one half of all the known serpents in the world. Their geographic distribution is very wide, although they chiefly abound in the tropics. Some of them are terrestrial, and some arboreal in their habits, the latter chiefly natives of the tropical parts of Asia and America. A few are inhabitants of fresh waters, and feed on fish. They are active in the pursuit of their prey, some of them feeding chiefly on small birds and quadrupeds, some on insects. They do not kill their prey by constriction, like the boas. Some of them are singularly and brilliantly colored. A few, particularly of the arboreal species, are remarkable for their extremely lengthened form. None of them grow to a very large size. To this family belong the common ringed snake (*natrix torquata*) of England, the only British species. To the genus C. belong the black snake (q.v.) of America, and the serpent of Æsculapius (*C. Æsculapii*), figured by the ancients as an attribute of their god of medicine. It is of a brownish color, and attains the length of 4 or 5 feet. It is found in the center and s. of Europe, is easily tamed, and exhibits the greatest gentleness of manners.

COLUBRI'NA, one of the sub-orders of serpents, distinguished from the viperina by being oviparous, and by a different arrangement of teeth and maxillary bones. The C. includes more than half the known species of snakes.

COLU'GO. See FLYING LEMUR.

COLUM'BA, SAINT (called also ST. COLUM-CILLE and ST. COLM), one of the greatest names in the early ecclesiastical history of the British isles, was born (it is believed, at Gartan, in the county of Donegal) in the n. of Ireland, on the 7th of Dec., 521. His father, Fedhlimidh, of the powerful tribe of the Cinel Conaill, was a kinsman of more than one chief or prince then reigning in Ireland and in the w. of Scotland; and his mother, Eithne, was also of royal descent. To this distinguished parentage, no doubt, he owed some measure of his great influence upon the minds of his countrymen.

He studied first at Moville, at the head of Strangford Lough, under St. Finnian, by whom he was ordained a deacon; and afterwards under another St. Finnian, at Clonard, where he was ordained a priest. Among his fellow-disciples, he is supposed to have had St. Comgall, St. Ciaran, and St. Cainnech; and so conspicuous was his youthful devotion, even in that saintly company, that he received the name by which he is perhaps still best known in Ireland—"Colum-cille," or "Columba of the Church." In 546, when no more than twenty-five, he founded Derry, and six or seven years afterwards, Durrow, the greatest of all his Irish monasteries. He seems now to have embroiled himself in the civil strifes of his country; and the belief that he instigated the bloody battle of Cooldrevny, in 561, led to his excommunication by an Irish ecclesiastical synod. The justice of the sentence was challenged by ecclesiastics of rank, but it was probably among the causes which determined him to leave Ireland.

It was in 563, when in his 42d year, that, accompanied by twelve disciples, he set sail for the little island of Hy or Ioua, as it was then called—now better known as Iona (q.v.), or I Colum-cille—of which he obtained a grant, as well from the king of the Picts as from his kinsman the king of the Scots. Having planted a monastery here—built, it would seem, chiefly of wattles—he set himself to the great work of his life, the conversion of the Pictish tribes beyond the Grampians. The Picts dwelling to the s. of that mountain barrier had been converted by St. Ninian of Whithern, in the 5th c.; and the Scots who peopled the western shores and islands of Scotland, were either Christians before they passed over from Ireland, or were afterwards converted by Irish missionaries. St. C. now brought the Picts of the n. to the true faith; but, unfortunately, very little is known of the way in which he accomplished his task. Bede speaks simply of his "preaching and example." Adamnan, extolling his gift of miracles, tells how the gates of the Pictish king's fort burst open at his approach, and

how, as he chanted the 45th Psalm, his voice was preternaturally strengthened, so as to be heard like a thunder-peal above the din and clamor by which the Pictish magicians tried to silence his evening prayer under the walls of the Pictish palace. We get another glimpse of his missionary footsteps from the *Book of Deer*, a Celtic MS. of the 11th or 12th c., lately discovered at Cambridge. It records how "Colum-cille and Drostan, the son of Cosreg, his disciple, came from Hy, as God had shown them, to Aberdour" (a beautiful little bay among the huge cliffs which fringe the coast of Buchan, as the n.e. district of Aberdeenshire is still called); how "Bede, a Pict, was then high-steward of Buchan, and gave them that town in freedom for evermore;" how "they came after that to another town, and it was pleasing to Colum-cille, for that it was full of God's grace; and he asked of the high-steward, Bede, that he would give it to him, but he gave it not; and, behold, a son of his took an illness, and he was all but dead, and the high-steward went to entreat the clerics that they would make prayer for his son, that health might come to him; and he gave in offering to them from Cloch-in-Tiprat to Cloch-Pette-mic-Garnait; and they made the prayer, and health came to him." In some such way as this, St. C. and his disciples seem to have traversed the Pictish mainland, the Western islands, and the Orkneys, establishing humble monasteries, whose inmates ministered to the religious wants of the people. The parent-house of Iona exercised supremacy not only over all these monasteries, but over all the monasteries which St. C. had built in Ireland, and over those which were founded by his disciples in the northern provinces of England when they converted the Angles and the Saxons. Thirty-four years appear to have been spent by St. C. in raising up and perfecting his ecclesiastical system in Scotland. But the labor did not so wholly engross him, but that he found time for repeated voyages to Ireland, and for a visit to Glasgow, where St. Kentigern or Mungo was restoring Christianity among the Welsh or British tribes of Cumbria and Strathclyde. The health of St. C. seems to have begun to fail in 593, but his life was prolonged till he reached his 77th year, when he breathed his last as he knelt before the altar of his church in Iona, a little after midnight, between the 8th and 9th of June, 597. He was buried within the precinct of his monastery, and his bones, which were afterwards enshrined—the stone pillow on which he slept, his books, his pastoral staff, and other things which he had loved or used, were long held in great veneration. No composition certainly known to be his has been preserved; but there have been attributed to him three Latin hymns of some merit, a short monastic (or rather heremitical) rule in Celtic, and several Celtic poems, among which is a collection of his prophecies.

The strength of St. C.'s character appears to have been in its earnestness. There is no reason to think that he was reputed either wiser or more learned than the better class of the ecclesiastics of his age. But the same enthusiastic temper which won for him in boyhood the name of "Columba of the Church," continued to animate him throughout life. The length and frequency of his fasts and vigils are spoken of as nearly incredible. With this asceticism he combined unwearied industry; no hour passed without his allotted duty of prayer, or reading, or transcribing, or other work. As the prevailing austerity of his disposition was often lighted up by gleams of tenderness and kindness, so it appears to have been clouded at times by anger and revenge. "But whatever sort of person he was himself," wrote Bede, in allusion probably to these infirmities, "this we know of him for certain, that he left after him successors eminent for their strict continence, divine love, and exact discipline; men who follow, indeed, doubtful cycles in their computation of the great festival [i.e. Easter], because, in that far out of the world abode of theirs, none had ever communicated to them the synodal decrees relating to the paschal observance, but yet, withal, men diligently observing those works of piety and chastity, and those only, which they were able to learn from the writings of the prophets, evangelists, and apostles.

The ecclesiastical system of St. C. was in so far peculiar that, in the words of Bede, Iona "had always for its ruler a presbyter abbot, to whose jurisdiction both the entire province, and the bishops themselves also, contrary to the usual order of things, must own subjection, after the example of that first teacher of theirs, who was no bishop, but a presbyter and monk." The jurisdiction usually reserved to the episcopate was thus transferred to the abbatial office; little more being left to the bishop than the right of ordination, and a certain measure of precedence in the celebration of divine service. St. C. himself, as well as his followers generally, till the year 716, kept Easter on a different day, and shaved their heads after another fashion, than obtained in other parts of western Christendom. But, with these exceptions, their creed and rites appear to have been substantially the same.

The life of St. C. was written by two of his successors in the abbacy of Iona—Cuimine Ailbe (657–669), and St. Adamnan (679–704). The first of these lives is incorporated in the second, which is altogether one of the most valuable works now extant on the early ecclesiastical history of Scotland and Ireland. It has gone through many editions; the last, and incomparably the best—a book, indeed, beyond praise—being that of William Reeves, D.D., printed at Dublin in 1857, for the Bannatyne club and the Irish archæological and Celtic society, and included in the series of *Historians of Scotland*, published by Edmonston and Douglas. Besides his *Vita Sancti Columbæ*, Adamnan wrote *De Locis Sanctis*, an interesting account of Jerusalem and its neighborhood, from the information of a French bishop, who, in returning from the Holy Land, was driven

among the western isles of Scotland. This tract has been more than once printed, and its chief passages were transcribed by Bede in his *Historia Ecclesiastica Gentis Anglorum*. We learn from it that waxed tablets for writing were in use among the disciples of St. C. in Iona at the close of the 7th century.

COL'UMBAN, or **COLUMBAN'US**, SAINT, one of the most learned and eloquent of the many missionaries whom Ireland sent forth to the continent during the dark ages, was b. in Leinster about the year 545. Having studied under St. Comgall, in the great monastery of Bangor, in Ulster, he passed over to France, in his 45th year, accompanied by twelve companions, and founded the monasteries of Annegray, Luxeuil, and Fontaine. His adherence to the Irish rule for calculating Easter involved him in controversy with the French bishops about 602; and a few years later, the courage with which he rebuked the vices of the Burgundian court, led to his expulsion from France. Passing through Switzerland into Lombardy, he founded, in 612, the famous monastery of Robbio, in the Apennines, where he died on the 21st Nov., 615. His life, written within a century after his death, by Jonas, one of his successors in the abbacy of Bobbio, has been repeatedly printed. The writings of St. C., which are wholly in Latin, consist of a rule for the government of his monastery, a few poems, several letters on ecclesiastical affairs, and 16 short sermons. His monastic rule has been printed more than once; but the most complete edition of his works is in Fleming's *Collectanea Sacra*, published at Louvaine in 1667, and now of such rarity that a copy of it sells for about £35. Of the sermons of St. C., M. Guizot remarks, that "the flights of imagination, the pious transports, the rigorous application of principles, the warfare declared against all vain or hypocritical compromise, give to the words of the preacher that passionate authority which may not always and surely reform the soul of his hearers, but which dominates over them, and, for some time at least, exercises paramount sway over their conduct and their life." The town of San Colombano, in Lombardy, takes its name from the Irish monk, as the town and canton of St. Gall (q.v.), in Switzerland, perpetuate the name of the most favored of his disciples.

COLUMBA'RIUM (Lat.), a dove-cote or pigeon-house. When used in the singular, C. also signified a particular kind of sepulchral chamber used by the Romans to receive the ashes of bodies which had been burned. The name was derived from the chamber being surrounded by small niches or holes resembling the holes in a dove-cote (columbaria) in which the urns (*ollæ*) were deposited. Tombs of this description were chiefly used by great families for depositing the ashes of their slaves and dependents. Several of them are still to be seen at Rome. One, quite perfect (figured in *Smith's Dictionary of Greek and Roman Antiquities*), was discovered at the Villa Rufini, about 2 m. beyond the Porta Pia, in 1822. In each niche were two urns, with the names of the persons whose ashes they contained inscribed over them.

COLUMBIA, the federal district of the United States, and the seat of the general government, lies on the left bank of the Potomac, being territorially within the limits of Maryland. The district contains about 60 sq.m.—its chief cities being Washington, the capital of the Union, and Georgetown. Pop. '70, 131,700, of whom 88,278 were whites, and 43,404 colored. This territory was originally 100 sq.m. in area, but in 1846 the county of Alexandria was incorporated with Virginia, and C. was reduced to its present size. For a long time C. was less favorably situated than the territories in regard to parliamentary representation; but now, like them, it sends one delegate to congress.

COLUMBIA, a name long applied to the region to the w. of the Rocky mountains, comprehending the present state of Oregon, the territory of Washington, and British Columbia.

COLUMBIA, a co. in s.w. Arkansas, on the Louisiana border; 950 sq.m.; pop. '80, 14,087—5,499 colored. Has a level and fertile soil, producing, corn, cotton, etc. Co. seat, Magnolia.

COLUMBIA, a co. in n.e. Florida, on the Georgia border, bounded by the Suwannee and the Santa Fé rivers; 864 sq.m.; pop. '80, 9,589—4,769 colored. Surface level and soil sandy; productions mainly agricultural. Co. seat, Lake City.

COLUMBIA, a co. in e. Georgia, on the Savannah river and the South Carolina border, traversed by the Georgia railroad; 500 sq.m.; pop. '80, 10,465—7,440 colored. The surface is uneven; productions, agricultural. Co. seat, Appling.

COLUMBIA, a co. in s.e. New York, e. of the Hudson river, on the border of Massachusetts, traversed by the Harlem, the Hudson River, the Boston and Albany, and the Hudson and Boston railroads; 620 sq.m.; pop. '80, 47,925. The surface is varied, and the soil productive. There are warm springs at New Lebanon. The chief productions are rye, corn, oats, buckwheat, potatoes, hay, butter, wool, hops, and orchard fruits. Co. seat, Hudson.

COLUMBIA, a co. in n.w. Oregon, bounded e. and n. by the Columbia river, which separates it from Washington territory; 470 sq.m.; pop. '80, 2,042. Coal and iron are found. Co. seat, St. Helena.

COLUMBIA, a co. in e. Pennsylvania, intersected by the Lackawanna and Bloomsburg and the Catawissa railroads, and the North Branch canal; 375 sq.m.; pop. '80, 32,408. Spurs of the Alleghany range make the surface hilly and mountainous, but the valleys are fertile. Iron ore and limestone are abundant. Productions chiefly agricultural. Co. seat, Bloomsburg.

COLUMBIA, a co. in s. Wisconsin, intersected by the Wisconsin and Neenah rivers, and crossed by the Milwaukee and St. Paul railroad; 751 sq.m.; pop. '80, 28,065. The surface is rolling or hilly, and the soil fertile, producing the usual farming crops. Co. seat, Portage City.

COLUMBIA, a village, the co. seat, of Boone co., Mo., 115 m. w.n.w. of St. Louis, on a branch of the North Missouri railroad; pop. '70, 2,336—798 colored. The village is the seat of the state university.

COLUMBIA, a borough in Lancaster co., Penn., on the Susquehanna river at the terminus of the e. division of the state canal, and Philadelphia and Columbia railroad. There is also rail connection with Harrisburg, York, and Baltimore. Pop. '70, 6,461. This place is the principal depot for lumber brought down the Susquehanna in rafts.

COLUMBIA, the capital of South Carolina, United States, is situated on the e. bank of the Congaree river about 100 m. n.w. of Charleston. It is the terminus of the navigation of the Congaree, and of three railways that connect it with Charleston and the coast. Before the civil war it was one of the handsomest cities of the southern states, but it suffered largely during the conflict, having had its principal parts destroyed by fire. It is now fast recovering from the effects of that calamity. C. is the center of a rich agricultural district, and has forests of pine, oak, walnut, and maple in its vicinity which produce a large quantity of timber. It has several educational and other institutions, including South Carolina university, founded in 1804. Pop. in 1870, 9,288, about half of whom were colored.

COLUMBIA, the capital of South Carolina, in Richmond co., on the e. side of Congaree river, a short distance below its junction with Broad river, 137 m. n.w. of Charleston, and reached by three railroads; pop. '70, 9,288—5,295 colored. The river is navigable to this point. The city is handsomely laid out, and the surrounding views are very fine. There is a fine park, and the streets are well shaded. The state house, built of granite, occupies a commanding situation near the center of the city. The executive mansion and the city hall are also attractive buildings. The city is well supplied with water and gas, and has a very considerable manufacturing industry. This place was purposely selected for the capital by a law passed in 1786, which provided for the foundation of a city. During the war of the rebellion, the old state house and its library of 25,000 volumes, a convent, several churches, the railroad depot, and a vast quantity of cotton were burned, whether by the confederate or union forces, or purposely, has not been satisfactorily determined.

COLUMBIA, a city in Maury co., Tenn., on Duck river, 38 m. s.w. of Nashville, reached by the Nashville and Decatur railroad; pop. '70, 2,550—1108 colored. Jackson college is situated here, and the place was the residence of James K. Polk before he was elected president, the stream giving him the title of "The Duck river statesman."

COLUMBIA, BRITISH, since 1871 a province of the Dominion of Canada, is divided into two parts—the mainland, commonly called British C.; and Vancouver's island (q.v.). These were formerly independent colonies, but were united in 1866. The total area of the province is estimated at 220,000 sq.m. As Vancouver's island is separately treated, the present article, as far as possible, will confine itself to an account of the mainland, which is situated in lat. 49° to 55° n., long. 115° to 132° w., and measures about 420 m. in breadth by 300 in length, its total area being estimated at upwards of 120,000 sq. miles. Its northern limit, as settled by act of parliament in 1858, follows the Simpson river to the Pacific ocean on the w., and the Finlay, an affluent of the Peace, to the Rocky mountains on the east. Running parallel with the chain on the e. border, which itself rises, in Mt. Brown, to a height of 16,000 ft., two ranges divide the width of the country into three sections of drainage. In the e. are head-waters, which find opposite outlets in the estuaries of the Columbia and of the Mackenzie; through the entire middle and part of the e., the Fraser maintains a southerly course, till, at fort Hope, it is bent sharply to the right by a mountain barrier, so as to enter the gulf of Georgia barely within the international boundary;* and lastly, across the w., a series of streams, generally meeting long and narrow inlets of the ocean, and terminating in the Skeena, which, with its upland reservoir, Babine lake, of 100 m. in length, is but little inferior to the Fraser itself. The principal harbors are Burrard inlet, on the gulf of Georgia, a few miles from New Westminster, and the chief port for the lumber trade; Howe sound, n. of Burrard inlet; Bute inlet, still farther n.; Millbank sound, which will

* The decision of the German emperor (21st Oct., 1872) on the *San Juan Boundary Question*, has affirmed the accuracy of the American interpretation of the treaty of 1846, in virtue of which the boundary of the United States runs through the Haro channel, and the San Juan archipelago, lying between Vancouver's island and the mainland, and commanding the outlet to the Pacific, has been assigned to the latter power.

become valuable as the gold mines on the Peace river attract a population; the river Skeena, now ascended by steam-vessels, and one of the routes to the Ominica gold mines; and the river Nass, near the frontier of Alaska, watering a region also believed to be rich in gold.

The interior of British C., i.e., the region between the Cascade range and the Rocky mountains, is, on the whole, rugged and lofty, and though rivers are numerous, they do not serve the purposes of irrigation, being often confined within deep ravines. Still the tracts of arable land are of considerable extent, and very fertile. In 1872, some land 1700 ft. above the sea-level, yielded, under proper irrigation, 40 bushels of wheat per acre. The pastures of British C. are, however, likely to prove much more valuable than its arable ground. They are almost endless in extent. On the Cariboo road (between Soda creek and Quesnel), there is a plain 150 m. long, and 60 or 80 wide; and between the Thompson and Fraser rivers there is an immense tract of grazing land. The hills and plains are covered with bunch grass, on which the cattle and horses live all winter, and its nutritive qualities are said to exceed the celebrated blue grass and clover of Virginia.

The forest-lands are also of vast extent, and yield most valuable timber. The principal trees are the Douglas pine, Menzies fir, yellow fir, balsam hemlock, white pine, yellow pine, cedar, yellow cypress, arbor vitæ, yew, oak, white maple, arbutus, alder, dog-wood, aspen, cherry, willow, and cotton-wood. The Douglas pine is almost universal on the sea-coast and up to the Cascade range. The cedar, white pine, and maple are found everywhere; the Scotch fir, the willow, and cotton-wood on the bottom-lands. But the lumber-trade is only beginning; the value of the exports, in 1870, amounting to little more than £25,000. The Fraser river and its tributaries, with the numerous lakes communicating with them, furnish great facilities for the conveyance of timber. The lower Fraser country especially is densely wooded. Smaller streams and the numerous inlets and arms of the sea do the same thing for the region further north.

The *fisheries* of British C. are perhaps the richest in the world, but their distance from populous centers has hitherto prevented their development. Whales and seals abound off the northern coasts. Sturgeon are plentiful in the rivers and estuaries; they are found weighing over 500 lbs., and are easily caught. The salmon of the Fraser river are famous over the American continent; so are the oulachans, small sprat-like fish, which enter the river in millions; some are so full of oil that, it is said, they will burn like a candle. Cod, herring, halibut, anchovies, haddock, etc., are caught in great quantities.

Steamers now ascend the Fraser as far as fort Yale, and others have been put on in various parts of the province, to provide easier access to the mining districts; but the inland routes are of the rudest description. Up the left of the Fraser, however, there is a tolerable road as far as Lytton at the confluence of the Thompson. The grand obstacle, however, in the way of all improvements, centers in the more attractive character of mining than of any more regular pursuit. Independently of silver, which has been discovered in the lower basin of the Fraser, and of copper, which is known to exist immediately to the e. of the same, gold may be said to be universally diffused. In addition to the old "diggings," new mines were opened in 1871, in the n., in the Peace and Ominica district, and yielded in the same year over £80,000. The total yield for the province in 1875 was about £500,000, and the total yield from 1857 has been estimated at about £7,000,000. The only obstacles to the prosecution of almost inexhaustible gold-mining are the want of roads, the want of capital, and the want of a thorough geological survey. Silver mines have been opened in the Fraser valley. Coal and iron are also found. Furs are one of the most important products of the country, the value of the exports of that article in 1874, being upwards of £60,000. The most valuable are the black and silver fox, sea otter, red fox, fur seal, mink, martin, beaver, and common otter. Buffalo are found on the plains; bears, and goats, and sheep on the mountains; elk are met with on the coast, and deer on the groups of small islands; wild ducks and geese are abundant; grouse and snipe are found everywhere; and in the plains a kind of tall buff crane, 4 or 5 ft. high.

The *climate* varies according to the locality, owing principally to four causes: (1) greater or less distance from the sea; (2) or from the mountain regions; (3) difference in the variety and growth of vegetation; (4) difference of level. The low portions near the sea and on Vancouver's island have a moderate climate, with a temperature ranging from 20° in winter to 80° in summer. The spring is short, lasting from the beginning of Mar. to the early part of May. A short spring lasts from Mar. till May; summer, from May till Sept.; the next two months are autumn, of which winter is only an aggravation, the snows being light, and the frosts far from severe or lasting.

To its mineral resources, British C. mainly owes its present position. It was the discovery of gold in 1857—coinciding as it did with the expiration of the Hudson's bay company's licensed monopoly—that led to the establishment of the colony in 1858. In connection with this same cause, adventurers from the United States, from Great Britain and its dependencies, and from China, have flocked hither. According to the census of 1871, the pop. of the province was 10,586, exclusive of Indians, who are estimated at from 30,000 to 50,000, but their numbers are diminishing from small-pox, measles, and tribal wars. When the Canadian Pacific railway is completed, this

province will become one of the most valuable in the dominion. The different routes proposed have provoked much local contention; but the visit of earl Dufferin, the governor-general, in 1876, has done good service in removing obstacles to this great enterprise.

British C. is represented in the Canadian parliament by 3 senators and 6 members of the house of commons; but it has also a local legislature, a lieut.gov., and an executive council. The chief towns are Victoria and New Westminster.

COLUMBIA, or OREGON, the largest stream on the w. side of America, rises in the Rocky mountains, draining that range by means of its different head-waters, from about lat. 54° n. to about lat. 42° n. Its two main branches—the C. proper from the n.n.e., and the Snake from the s.e.—meet about lat. 46° 5′ n., long. 118° 55′ w., and united, run together to long. 124° 5′ w., where they empty themselves into the Pacific in a latitude corresponding with that in which they joined. This great river, long vaguely believed to exist, was discovered only in 1792, by capt. Gray of Boston in Massachusetts, who gave it the name of his own vessel in place of the floating appellations of the Oregon and the San Roque. The extreme length cannot be less than 1000 m.; most of its course—all, in fact, but the upper part of the n. branch—being within the limits of the United States. Nevertheless, the entire navigation is equally open to the British and to the Americans. That navigation, however, is of comparatively little value, more particularly to the former nation. The river is broken by falls and rapids into many separate portions; and of these, even the lowest and most important, the maritime reach itself, does not exceed 90 m. in length. In addition to the inland impediments, the ingress and egress are embarrassed by a surf-beaten bar, which, with few and precarious passages, extends from cape Disappointment on the n., to point Adams on the south. Still, as a harbor, the C. has the recommendation of being decidedly the best on the coast between San Francisco, which is nearly 600 m. to the s., and Port Discovery, which is fully 150 m. to the north.

COLUMBIA COLLEGE. In Dec., 1746, an act of the colonial assembly was passed to raise money by public lottery for the encouragement of learning and towards the founding of a college in the city of New York. The amount thus raised was vested in ten trustees, seven of whom were members of the church of England and some of them vestrymen in Trinity church. A parcel of ground, w. of Broadway, bounded by Barclay, Church, and Murray streets, and the Hudson river, was granted by Trinity church as the site for the college. On a portion of this, at the foot of what was afterwards called Park place, the college edifice was built; the rest of it was leased and became a very valuable endowment. Dr. Samuel Johnson, of Connecticut, was chosen president, and in July, 1754, commenced the instruction of a class of students in the school-house belonging to Trinity church. Soon after, a charter was obtained, according to which the institution was called King's college, and was to be governed by a board of trustees, consisting of the archbishop of Canterbury, the first lord commissioner for trade and plantations, the lieutenant-governor of the province, several other public officers, the ministers of the five principal religious denominations in the city, and twenty-four private gentlemen. The new buildings were first occupied in 1760. In 1763, a grammar school was established. In March of that year, on the resignation of Dr. Johnson, the Rev. Dr. Myles Cooper of Oxford, Eng.—an accomplished scholar—was elected president. In 1767, a grant of land containing 24,000 acres was obtained from the province, but as it was within the bounds of what afterwards became the state of Vermont, it was ultimately lost. In Aug., 1767, a medical school was established. Before the war of the revolution, the emoluments of the college were largely increased by grants from the king and by contributions in England and America; and the course of instruction was extended so as to include "divinity, natural law, physic, logic, ethics, metaphysics, mathematics, natural philosophy, astronomy, geography, history, chronology, rhetoric, Hebrew, Greek, Latin, modern languages, the belles-lettres, and whatever else of literature may tend to accomplish the pupils as scholars and gentlemen." Among the earliest graduates were Robert R. Livingston, Gouverneur Morris, and John Jay. "All students, except those in medicine, were required, unless specially exempted, to live in the college building, the grounds of which were surrounded with a high fence whose front gate was constantly attended by a porter and was closed each evening in winter at 9 o'clock, and in summer at 10. The names of all students who came in after the hour were reported to the president." In the disputes which arose with England, Dr. Cooper wrote on the side of the mother country and was answered by an anonymous correspondent, who afterwards was found to be Alexander Hamilton, then a student. When the war commenced, Dr. Cooper returned to England, and the Rev. Benjamin Moore was chosen to take his place. In 1776, the building became a military hospital, the students were scattered and the college was broken up. On the return of peace, when its affairs were put in order, its name was changed to Columbia college, and its original charter, with the necessary alterations, was confirmed by the legislature of the state. DeWitt Clinton was among the first students under the new order of things. In May, 1787, Dr. William Samuel Johnson, an eminent lawyer and statesman, and son of the first president, was elected to the office. Among the students of this period, was John Randolph of Roanoke. In July, 1800, Dr. Johnson resigned, and was followed first by Dr. Wharton and soon after by

bishop Moore, with the understanding that, on account of his ecclesiastical duties, he would not ordinarily take an active part in the business of the college. In 1810, the standard of admission was raised and a new course of studies arranged. In 1811, bishop Moore having resigned, in order that a president might be chosen who could give his whole time and attention to the office, Rev. William Harris was elected, with the addition of Rev. John M. Mason as provost. This office was created for Dr. Mason, and held by him only. He had charge of the senior class and gave new life to the lecture-room. He resigned in 1816. In 1814, a grant of land, containing about 20 acres, and then valued at $5,000, was made to the college by the legislature, with the condition (afterwards repealed) that new college buildings should be erected on it. As this ground is between 5th and 6th avenues, and extends from 47th to 51st street, its value has, of course, vastly increased. Between 1817 and 1820, the old edifice was thoroughly repaired and additional buildings were erected. In 1829, a grammar school was established under the charge of the faculty, and a building for it erected within the grounds. This school was discontinued in 1864. In 1830, besides the original course of study, which was continued entire, a scientific and literary course was established, the advantages of which, either entirely or in part, were offered to persons who were not matriculated students; but as it did not appear to find favor with the public, it was discontinued in 1843. At the same time the Gebhard professorship of the German language and literature was established upon the endowment made by the bequest of Frederick Gebhard. In 1847, the study of German was made voluntary for the two higher classes, and in 1857 for all the classes, with the addition of two annual prizes of $30 each, and two of $20 each, in order to stimulate attention to the study. The requirements of commerce having, after the lapse of a century, made the removal of the college from its original site necessary and desirable, new buildings were erected for it on the block extending from 49th to 50th street, between 4th and Madison avenues, and were occupied in 1857. At the same time the scope of instruction was greatly enlarged and several new professors were added to the faculty. In 1858, the law school was established. The distinguished jurist, chancellor Kent, had formerly been professor of law in the institution, and had delivered courses of lectures which attracted much attention and were of great service in preparing students to practice at the bar. He was followed by William Betts, LL.D., whose lectures were at length wholly discontinued. The object of the new organization was to give law students a systematic and comprehensive course of instruction, and to combine the constant drill of oral recitation with lectures by thoroughly qualified professors. The advantages expected from the system adopted have been attained. In 1860, a union was effected with the college of physicians and surgeons by which it became the medical department of Columbia college. The union is complete in the single respect that the united authority of the two institutions is necessary to the conferring of degrees; all diplomas bearing the signature of the president of C. college with those of the faculty of medicine. The school has an independent board of trustees, and its financial affairs are distinct from those of Columbia college. In 1864, the school of mines was established, with the distinctive purpose of furnishing the means for acquiring a thorough scientific and practical knowledge of those branches of science which relate to mining, and of supplying persons competent to conduct mining and metallurgical operations on scientific principles. Instruction is given in five regular courses of scientific study, viz.: Mining engineering, civil engineering, metallurgy, geology and paleontology, and chemistry, analytic and applied. In 1874, a new building for the school of mines, admirably adapted to its uses and work, was erected at a cost of $150,000, and this was followed in 1878 by a building for the school of arts. Prizes, scholarships, and fellowships have been founded by the trustees and by benevolent associations and individuals, to be annually conferred on students who excel in various departments of the several schools. The school of mines is provided with a library whose value has been greatly enhanced by a judicious selection of standard and recent works in the various departments of science which it embraces, and in their adaptation to the specific wants of the school. There are also collections of specimens and models illustrating all the subjects taught in the school. A liberal appropriation is annually made for the increase of the library and collections. The law school has a choice library of nearly 6,000 volumes, including works in all departments of legal study. The general college library contains about 20,000 volumes. The formation of it began in 1754. A large number of valuable books were contributed by friends of the institution in London and Oxford as well as in this country. But during the revolutionary war the library was removed from the college building and a great part of it was ultimately lost. It has since been enriched from time to time both by liberal gifts and large purchases. In forming it the wants of the faculty and students have always been first considered, so that it has become eminently a *college* library. There are also collections in astronomy, mathematics, philosophy, architecture, typography, natural history, music, and the fine arts; and a good supply of biographical dictionaries, encyclopædias, and reviews. The institution has in all its faculties, including the president, an assemblage of 123 professors, instructors, and assistants; and in all its schools a total of about 1500 students.

COLUMBIAD, a cast-iron howitzer intended chiefly for use in sea-coast defense. The howitzer shell guns were remodeled in 1844, when the larger gun was first named

columbiad. In 1861, the Rodman exterior form was applied to these and other heavy guns.

COLUMBIAN'A, a co. in e. Ohio on the Ohio river and bordering on Pennsylvania, traversed by the Sandy and Beaver canal, and by the Cleveland and Pittsburg, the Pittsburg, Fort Wayne, and Chicago, and the New Lisbon railroads; 490 sq.m.; pop. '80, 48,603. The surface is level in the n. and hilly in the s. portion, and the soil fertile; productions chiefly agricultural. Co. seat, New Lisbon.

COLUM'BIDÆ, a family of birds, often comprehended under the general English names *dove* and *pigeon*, and forming the genus *columba* (Lat. pigeon) of Linnæus. They are generally ranked among gallinaceous birds, but exhibit points of resemblance to the order *insessores*, and have by some naturalists been constituted into a distinct order, intermediate between these. They agree with the true gallinaceous birds in the character of their bill, and in the soft naked tumid membrane at the base of it, in which the nostrils are pierced; also in their *rasorial* (scraping) habits and blunt claws; but they differ very widely from them in their great powers of flight, which are not surpassed in any other family of birds; in having the hind-toe on the same level with the other toes; in having no connecting membrane at the base of the toes; in not being polygamous but pairing, and in the male taking part with the female in the care of the young; in their having generally only two young ones at a time, but breeding often in a year; in their double crop, an expansion of the gullet on both sides, in which they differ from all other birds; and in the secretion, at breeding-time, of a milky fluid by the crop of both parents, as in the parrots, with which the food is saturated in order to fit it for the young, which, unlike those of the true gallinaceous birds, are at first very helpless. The number of species of C. is very great. There is amongst them so much resemblance, that scientific classification has been found very difficult. They are found in all warm and temperate climates, but comparatively few are European. The Indian archipelago particularly abounds in them. Many of the tropical species exhibit a brilliancy of colors scarcely excelled in the humming-birds or sun-birds. The chaste beauty of the plumage is always pleasing, even when brilliancy is wanting. The voice is very similar in all the species, the *cooing* of some, however, being harsh, that of others soft and pleasant. Some species are migratory, and some congregate in prodigious flocks. See BRONZEWING, CARRIER PIGEON, DOVE, FRUIT PIGEON, GOURA, GROUND-DOVE, PARTRIDGE PIGEON, PASSENGER PIGEON, PIGEON, TURTLE-DOVE, and VINAGO.

COLUMBINE, *Aquilegia*, a genus of plants of the natural order *ranunculaceæ*, having 5 colored sepals, which soon fall off, and 5 petals each terminating below in a horn-shaped spur or nectary. They are natives of the temperate and colder regions of the northern hemisphere. One, the common C. (*A. vulgaris*), is found in woods in some parts of Britain, and has long been familiar as an inmate of flower-gardens. It is a perennial, generally 3 or 4 ft. high, with flowers of curious structure and considerable beauty. C. was formerly much esteemed for medicinal virtues, which are now seldom heard of.—Some of the other species are very ornamental, and are pretty common in flower-borders.

COLUM'BIUM, or TAN'TALUM (symbol Ta), is a rare metal found in the mineral tantalite, obtained from Bodenmais, in Bohemia, and from Sweden. It can be obtained as a black powder, which assumes a lustrous aspect when subjected to the process of burnishing. It forms a series of compounds, of which only columbic acid (TaO_5) is worthy of notice.

COLUMBO. See CALUMBA, *ante*.

COLUMBRE'TES, or COLOMBRETES, islands in the Mediterranean, off cape Oropesa, belonging to Spain. They are of volcanic origin, and form a picturesque group. There is one good harbor, and on the largest island there are a few inhabitants. The C. are important only as a military station. They have been a noted resort for privateers.

COLUMBUS, a co. in s.e. North Carolina, between the Waccamaw and Lumber rivers; 600 sq.m.; pop. '80, 14,439—5,513 colored. The surface is level and marshy; productions, cotton, rice, etc. The Wilmington, Columbia, and Augusta railroad intersects. Co. seat, Whiteville.

COLUMBUS, a city in Georgia, the seat of justice of Muskogee co., on the Chattahoochie, 84 m. s.w. of Macon, reached by Muscogee railroad, and connected by railroad with Mobile. The river is navigable for the greater portion of the year, and affords ready communication with the neighboring cotton-growing districts. A change in the level of the river at C. furnishes a strong head of water, which has been turned to practical use by the construction of a dam, and other hydraulic contrivances. The city, which occupies an extensive area, is regularly laid out in wide and handsome streets. There are a court-house, a temperance hall, churches, and other public buildings. The chief industry is the cotton trade, but there are flour mills and manufacturing establishments. The town was laid out in 1828 on a portion of an abandoned Indian reservation. Pop. '70, 7,400—3,204 colored.

COLUMBUS, a village in Bartholomew co., Ind., 41 m. s.s.e. of Indianapolis, with which it is connected by railroad; pop. '70, 3,359.

COLUMBUS, a t. in Hickman co., Ky., on the Mississippi, 18 m. below Cairo; pop. '70, 1574—761 colored. The village is on a bluff, and was strongly fortified by the confederates early in the war of the rebellion; but the capture by the federals of forts Henry and Donelson, rendered C. useless, and the confederates abandoned it.

COLUMBUS, a city and seat of justice of Lowndes co., Miss., on the Tombigbee river, 132 m. n.e. of Jackson, having steamboat connection with Mobile, and a branch extending to the Mobile and Ohio railroad; pop. '70, 4,812—2,738 colored. The city is the shipping place for large amounts of cotton.

COLUMBUS, a city in Franklin co., O., the capital of the state, on the Scioto river, 100 m. n.e. of Cincinnati; pop. '70, 31,274. The city owes its importance almost entirely to the presence of the capitol and other state institutions. The streets are wide and regular, and finely shaded, and the squares and parks are handsomely improved. Among the prominent features are Goodale park, the city park, the gardens of the horticultural society, and Green Lawn cemetery. The chief public buildings and institutions are the state capitol, the penitentiary, and the asylums for the blind, the deaf and dumb, the insane, and the idiotic. There are also the U. S. arsenal, the city hall, the high-school building, the court-house, the almshouse, the opera-house, the odd-fellows hall, etc. Six or seven railroads center here; there are also horse railroads. The city was projected in 1812, and became the state capital in 1816.

COLUMBUS, Bartolommeo, 1432–1514; the eldest brother of the discoverer. In 1470, he was in Lisbon constructing maps and charts, and it is supposed that he went to the cape of Good Hope with Bartholomew Diaz. He was sent by his brother to England to seek the aid of Henry VII., but there is no evidence that he succeeded. After the discovery he was in favor as the brother of the admiral; and under him was lieut.gov. of the West Indies, in which position he showed discretion and courage.

COLUMBUS, Christopher (the Latinized form of the Italian *Colombo*, and the Spanish *Colon*), the great navigator who added a new hemisphere to our globe, is supposed to have been born at or near Genoa, in the year 1436, or as others say, 1446. Though virtually the greatest man of his era, there is little definite information about his family and his early life. It would appear, however, that he was the son of a wool-comber; that he attended for some little time the then great school of learning in Pavia, where he evinced a taste for astronomy and cosmography; and that he early went to sea, and made several voyages in the Mediterranean. Settling in Lisbon in 1470, he there married the daughter of an Italian named Palestrello, who had distinguished himself as a navigator in the Portuguese service, and with her obtained some valuable charts, journals, and memoranda. Lisbon, at this time, was the head-quarters of all that was speculative and adventurous in the way of geographical discovery; and here, while constructing maps and charts for the livelihood of his family, C. first appears to have imbibed that idea of land to the westward, which he was destined after long disheartening years to establish as fact—the land, indeed, not being, as he had supposed it, a prolongation of the eastern shores of Asia, but a new western continent. With the view, apparently, of better qualifying himself for his great enterprise, C. made several voyages to the Azores, the Canaries, and the coast of Guinea—then the limit of European navigation in this direction. Not until about 1482 or 1483, did C. find opportunity to lay his scheme before John II. of Portugal. This monarch referred it to a junto of nautical and scientific men, who decided against it. The king, however, meanly taking advantage of a detailed plan obtained from C. under false pretenses, secretly sent out a vessel to examine the route. Too timid to venture far from the beaten track, the pilots soon returned to Lisbon, to throw ridicule on the project. Disgusted with the duplicity of his sovereign, C. secretly left Lisbon in 1484, taking with him his little motherless boy Diego. He found his way to Genoa, where the republic, before whom he unfolded his scheme, treated it as the silly product of a visionary brain: and it is said that he also met with like treatment from the Venetians; but it appears doubtful whether he at this time communicated with them. Disappointed, but not despairing, for C. was buoyed up with the belief that heaven had commissioned him to plant the banner of the cross upon those shores which as yet appeared to exist but in his own imagination, C. turned his steps towards Spain. Weary and hungry, he stopped one day at the gate of the Franciscan convent La Rabidi, in Andalusia, to beg some bread and water for his child. This day was the turning-point in his career. The superior of the convent, Juan Perez de Marchena, passing at the moment, entered into conversation with the traveler, and was so struck with the grandeur of his views, that he used all his influence to procure him the favorable consideration of the king and queen. It was not, however, until seven more years of disappointments had passed over—during which C. had applied to other courts, and without avail—that he found himself in command of three small vessels, only one of which was decked, with 120 men, ready to start on his adventurous enterprise. C. claimed, as reward, to be nominated high-admiral, and governor-general and viceroy, over all the lands he discovered, with a tenth of the produce of the countries. On the 3d of Aug., 1492, C. set sail from the bar of Saltes, near Palos. Delaying a month at the Canaries to refit, he started thence, on the 6th of Sept., over unknown seas. His crew soon began to interpose

their timid fears, and when these were unavailing, to express their open disaffection; but equally disregardful of both, C. bore steadily westward; himself, however, not without misgiving as to what the variation in the needle (not before discovered) portended. On the 12th of Oct., his perseverance was rewarded with the sight of land, which proved to be one of the Bahama islands. Here he solemnly planted the cross, giving the island the name of San Salvador. After discovering several other of the West India islands, including Cuba and Hayti, or San Domingo, at the latter of which, called by him Hispaniola, he settled a small colony, C. set sail again for Spain, where he arrived on the 15th Mar., 1493, and was received with every demonstration of joy and admiration, as well by the people as the court. In Sept. of the same year, he set sail from Cadiz on a second expedition, with 17 ships and 1500 men. In this voyage, he discovered the Caribbee islands, Jamaica, etc.; but calumnies at home forced him to return in 1496. Having cleared himself with his sovereigns, he, in 1498, set out on a third expedition. This time, steering more to the southward, he discovered Trinidad, and the mouths of the Orinoco, and landed at Paria, on the coast of South America. After these discoveries, C. steered for Hispaniola, where he found everything in disorder. The king's ear had been again abused; an officer named Bovadilla had been appointed to supersede C. as governor, and by this person C. was sent home in chains. This unworthy treatment excited the indignation of the Spanish people to such a degree, that Ferdinand was fain to disavow all knowledge of the disgraceful affair. But all C.'s efforts to obtain redress from the king were fruitless. The spirit of adventure, however, which had borne him up amid so many disappointments, was not to be crushed by injustice. It still burned bright and strong as ever within the great old man, who, on the 9th May, 1502, with four vessels and 150 men, set out once more to seek a passage uniting the Atlantic and Pacific oceans, which he imagined lay somewhere between Honduras and Paria. But the mutinous character of his crew forced him aside to seek for gold, and after many difficulties and disasters, and having added little of importance to his previous discoveries, he returned to Spain in Nov., 1504. Isabella was dead; Ferdinand proved basely ungrateful; and so the noblest navigator the world has seen, was permitted to die in poverty at Valladolid, 20th May, 1506. To make up somewhat for his injustice, Ferdinand gave C. a pompous funeral, and erected a magnificent monument to his memory, as if "Honor's voice" could

"Provoke the silent dust,
Or flattery soothe the dull cold ear of Death."

Biography furnishes no parallel to the life of C.; great men there have been who have met with disappointments and injustice, but there is perhaps no other instance of a great man whom disappointments and injustice did not dishearten and disgust; who had his greatness recognized in his life-time, and yet was robbed of the emoluments it entitled him to; and who, after death, had the honor he had so hardly won conferred upon another. See AMERIGO VESPUCCI.

COLUMBUS, or COLON, LOUIS, 1472–1579; a grandson of the discoverer. He withdrew his claim to the viceroyalty of India in 1540, and received in exchange the title of duke of Veragua and marquis of Jamaica, and a pension.

COLUMEL'LA.—1. The central axis which remains, formed of the placentas, when the carpels of some fruits have separated from each other and from them.—2. The central axis of the spore-cases (capsules) of mosses.—3. The central axis around which the whorls of many spiral univalve shells are closely wound.

COLUMELLA, LUCIUS JUNIUS MODERATUS, the most learned of Roman writers on practical agriculture, was b. at Cadiz, in Spain, and flourished in the earlier part of the 1st c. of the Christian era. For some time, he resided in Syria, but lived chiefly at Rome, and died, most probably, at Tarentum. His great work, *De Re Rustica*, in 12 books—the 10th, On Gardening, is versified—is addressed to one Publius Silvinus, and treats of arable and pasture lands, culture of vines, olives, etc., care of domestic animals, etc., respective duties of masters and servants, etc. A supplementary treatise relates to trees. This ancient "Book of the Farm" is written in good Latin, and the information is copious, though not precise, and in some points of questionable accuracy. The best editions of C. are by Gesner (1735 and 1773) and Schneider (1794–97).

COLUMN (Lat. *columna*), a pillar or post, usually cylindrical in form, employed for the purpose of supporting a roof, entablature, or other superstructure. As the earliest habitations in almost all countries were formed of wood, it is unquestionable that the earliest columns consisted of the trunks of trees. It is said that even at the present day the Greek peasants of Asia Minor construct their wood-huts so as almost exactly to resemble the form and disposition of parts which we find in the great architectural monuments of classical antiquity. That the Greeks actually made use of wood in the earliest time, even for their monumental structures, we learn on the testimony of Pausanias, who mentions a monument in the market-place at Elis which consisted of a roof supported by pillars of oak; and Pliny tells us that the temple of Juno at Metapontum was supported by pillars made of the stems of vines. From these facts, it is natural to conclude that the stone columns which came first into use would be imitations

of the trunks of trees; and this we are also in a condition to prove historically, many of the largest stone columns in Egypt—where, from the scarcity of wood, they were earlier introduced than elsewhere—being manifest imitations of the trunk of the palm (figs. 2 and 3). In order to prevent them from being forced into the ground by the superincumbent weight, these early wooden columns were placed upon one or more large flat stones, and on the top another stone was placed, to preserve them from the decay which the rain sinking into the wood would have occasioned. In these primitive arrangements, we plainly perceive the germ of the three principal parts of the classical C.—the shaft, the base, and the capital. As the Doric style of architecture was the earliest of the classical styles, the Doric is naturally the simplest and most severe of the classical columns. One of its most striking peculiarities is what at first sight seems to be the absence of the base (fig. 4). The true account of the matter, however, is, that all the columns in the same line of a Doric temple stand on one base, whereas, in the other orders, each C. has a separate base. But it is in the capitals in all the orders, Egyptian, classical, and Gothic, that columns differ from each other most strikingly (see below). As classical architecture advanced, greater lightness and elegance were sought after; and this, as regarded the C., was obtained by increasing the height and diminishing the proportional thickness of the shaft. In the Ionic and Corinthian orders (figs. 5 and 6), as compared with the Doric, this peculiarity may be distinctly seen.

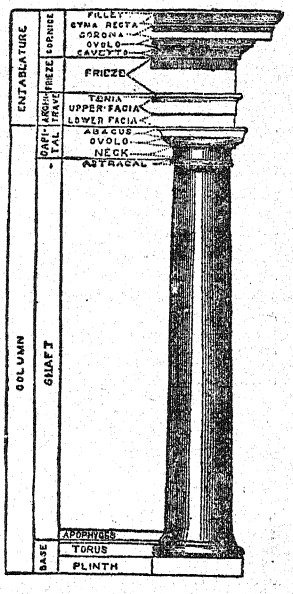


Fig. 1.
Column: Tuscan, with details.

In almost all columns, the shaft tapers gradually from the bottom to the top, thus imitating the natural growth of a tree, and at the same time conforming to a mechanical rule for obtaining the greatest amount of strength in upright bodies. But in place of tapering regularly, the shaft was generally made with a slight swelling towards the middle, called the *entasis*, and had for the most part in all the classical orders striped incisions from top to bottom called flutes or channels, which were regularly worked, and varied in number from 20 to 32. See FLUTING. The relation which subsisted between the height of the C., and

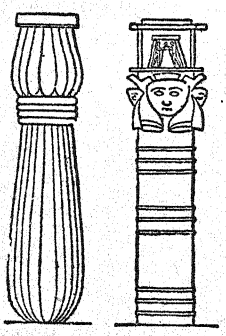

Fig. 2.

Fig. 3.

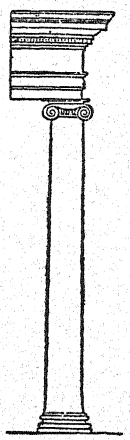

Fig. 5.

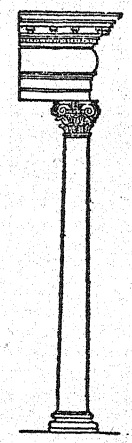

Fig. 6.

the diameter at the top and bottom, and between these and the entablature, has been calculated with the greatest possible precision in all the principal classical examples, and will be found stated in all professional works on classical architecture. The shaft usually consisted of several cylindrical blocks accurately fitted to one another, whilst the capital was commonly hewn out of a single stone. The separate portions of the shaft were fixed together, not by mortar or cement, but by iron cramps, which were fitted into holes in the center, and thus rendered invisible. Sometimes columns of immense size were hewn in the quarry of one piece of stone, and then rolled over the

ground, and raised to their destined positions by various mechanical contrivances. Columns were often used in classical times, and are employed by us in the interior of buildings to support the roof or galleries, as well as for purposes of decoration; and this custom seems to have prevailed in the halls of persons of great distinction even in Homeric times. In the ancient basilica (q.v.), a line of columns separated the central space which was open to the sky from the aisles of the building, whilst at the same time they supported the galleries which were placed above the aisles. These columns were the origin of the piers or pillars by which the nave is divided from the aisles in Christian churches. The same arrangement prevailed in the Roman atrium. When, in order to support the roof which covered the gallery or any other superstructure, a second row of columns was introduced, it was usually of the lighter styles, Ionic or Corinthian, the lower columns being commonly Doric. Single columns were erected for various purposes, as for mooring ships in harbors, or to commemorate persons of note, or national events. See PILLAR.

Capitals.—In classical architecture, it is by the capitals of pillars, more than by any other feature, that the different orders are distinguished, very much as the Gothic styles are marked by the form of the arch. Till the period of the renaissance, the head of a column, in English, was called chapiter (chapter), its diminutive being chapitrell. The three capitals which alone belong to pure Greek architecture are described in Thomson's well known lines (*Liberty*), so concisely and accurately, that it is needless to dwell on them in prose:

> "First unadorned,
> And nobly plain, the manly Doric rose;
> The Ionic then, with decent matron grace,
> Her airy pillar heaved; luxuriant last,
> The rich Corinthian spread her wanton wreath."

To the three Greek orders, the Romans added two others: the Tuscan, which was a variation on the Doric, or rather a corruption of it; and the Composite, which was a combination of the Ionic and Corinthian, the proportions and general character of the Corinthian being retained, but the Ionic volutes being substituted for the Corinthian leafage. As the trunks of trees placed upright, so as to support the roof, unquestionably led to the introduction of the stone pillar, there seems to be almost as little doubt that the capital was suggested by the boughs with which such trees might be supposed to be surmounted, or the garlands with which on festive occasions they were probably encircled and crowned. At first, when the power of working in stone was limited, imitation of foliage was scarcely attempted; but the original idea being adhered to, it came at last to be carried out with great success in the Ionic and Corinthian capitals of classical architecture, and in all of the more advanced of the Gothic styles.

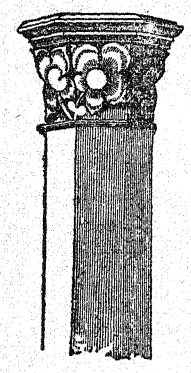

Fig. 7.

The forms of Gothic capitals are so various, that it is altogether impossible to particularize them here. Beginning with the Romanic —which is often nothing more than a modification of the Doric, or a further debasement of the Tuscan, the sides being truncated or flattened, and some of the moldings omitted—they advance very rapidly in adornment; and in the style which we call early English, they already frequently consist of a mass of foliage, cut with great boldness and freedom, so that the stalks and more prominent of the leafage are entirely detached. It is remarkable that, in the decorated style, the capital lost much of the richness which it possessed in the earlier styles, and often consists only of plain moldings, with or without a ball-flower (q.v.), cut on the bell or bowl of the capital. Where foliation is introduced in this style, it is usually worked with greater freedom, and is free from the stiffness which characterizes earlier work. Animals, figures in armor, heads of bishops in miters, and the like, are oftener found in the decorated style, though their introduction was not unknown at a much earlier period. In the perpendicular style, the capitals were stiffer in form, and generally less ornamented than in any of the others; though even here foliage is often introduced, as in the accompanying example from the cloisters of Christ church, Oxford.

The only invariable characteristics of capitals seem to be something like a molding at the upper part of the shaft, more or less complicated according to circumstances, and some sort of abacus (q.v.) or flat portion on the top, on which the architrave rested in the classical orders. These characters belong even to the Egyptian capitals, which in many other respects resemble those of the other styles. The foliation of Egyptian capitals is generally taken from the vegetation peculiar to the banks of the Nile (fig. 2); but the capitals of this, particularly in its later examples, were infinitely varied both in decoration and in form.

COLUMN, in military evolutions, is a mass of soldiers several ranks in depth, presenting a formation different from that which arises from spreading them out *in line*. There may be columns of brigades, of regiments, of battalions, or of companies; presenting a front of limited width, but a depth depending on the number of elements in

the column. If a battalion consists of 10 companies, then a "battalion in C." has all the companies posted one behind another. According to the density of the C., it is called *open* or *close*. In a battalion, when the distance between any one company and the one immediately before it is such as to admit of their wheeling into line, the formation is called *open* C.; when the distance between the front rank of one company and the rear rank of the one before it is only a few yards, it is *close* C.; when intermediate between these two, it is *half-distance* column. The relative advantages of C. and *line*, in drawing up troops for action, are among the matters closely studied by the commanders of armies: the French, as a general rule, have rather favored the formation in C.; the English, that in line. Sometimes the name C. is given to that which, in effect, is a small army.

CO'LURE. See ARMILLARY SPHERE.

COLUSA, a co. in n. California, between the Sacramento river and the coast range of mountains; 2,376 sq.m.: pop. '80, 13,118. The surface is rough; quicksilver, sulphur, and salt are found. Agriculture is the chief business. Co. seat, Colusa.

COLU'TËA. See SENNA.

COLWELL, STEPHEN, 1800–71; a native of Virginia, educated at Jefferson college, and admitted to the bar in 1821. He practiced law for several years, but left it for mercantile business. Besides many articles for reviews and magazines, he wrote a number of works on trade and finance, labor, banks, taxation, and kindred subjects.

COLYM'BIDÆ, a family of web-footed birds, distinguished by short wings, legs placed so far back that the bird always assumes an erect position when standing, broad flat tarsi (*shanks*), and a compressed bill, pointed at the tip. They are all extremely aquatic in their habits, and possess great powers of diving as well as of swimming. Some of them have all the front toes perfectly webbed, as the loons or divers (*colymbus*); others have the feet lobed, each toe with a separate membrane, as the grebes (*podiceps*). These are the two principal genera. The guillemots (*uria*) seem to connect this family with the *alcadæ*.

COL'ZA. See RAPE.

CO'MA, a Greek word used in medicine, to signify a state of more or less profound insensibility allied to sleep, but differing from natural sleep in its characters, as well as in the circumstances under which it occurs. In C., the patient lies on his back, and is either simply insensible to external impressions, or has a confused and dull perception of them, with restlessness and low delirium (q.v.). The former kind of C. occurs in apoplexy and epilepsy, and also in many other organic diseases of the brain and its membranes, of which, indeed, it may be said to be the natural termination. It is also seen in narcotic poisoning, and most characteristically in poisoning by opium (q.v.). In the most fatal forms, the breathing is very slow and noisy (snoring or stertorous), accompanied with puffing of the cheeks; the pulse is at first strong and regular, afterwards feeble; there is often lividity; and the pupils are either contracted or excessively dilated, but in either case immovable, and totally insensible to light. In the second variety of C., there is perpetual restless delirium, without enough of sensibility to lead to spontaneous and regular voluntary movements; the patient mutters slightly, and grasps feebly and without purpose at any object in his way; the pupils are commonly contracted, and the tongue is apt to be dry and brown. This kind of C. is mainly seen in many fevers, and forms one of the modes of their fatal termination. The treatment of C. is that of the disease or accident leading to it. Where there is a reasonable chance of recovery, the patient must be roused to consciousness as much as possible, either by frequent movements or strong impressions on the skin, or by the use of galvanism, so as to maintain the respiration. See OPIUM. Blistering of the head is also sometimes resorted to with good effect

CO'MA BERENI'CES (Lat. Berenice's hair), a small and close cluster of stars near the equinoctial colure, s. of the tail of the Great Bear.

COMAC'CHIO, a fortified t. of central Italy, in the province of Ferrara, and 3 m. from the Adriatic. The lagoon, or marsh, in the midst of which it is situated, is about 140 m. in circumference, and is shut out from the Adriatic by a narrow belt of mud. Its position is very favorable for the manufacture of salt, of which 2,000,000 lbs. are said to be obtained annually. C. is also the seat of a curious branch of industry—viz., eel culture, which forms the principal employment of its inhabitants, who number about 8,000. A series of canals have been constructed leading from the Adriatic to admit the fry of the eel, the mullet, the sole, and other fishes into the lagoon, where they are fattened, and speedily attain a marketable value. The fishery is carried on chiefly in the late autumn, when the waters of the lagoon are excited by storms. The fish, then seeking an outlet to the sea, find their way into certain labyrinths leading into reservoirs constructed at the termination of the canals, where they are caught in immense quantities. Religious ceremonies inaugurate the commencement of the season, and when any body of fishermen in one night capture 48,000 lbs. weight of fish, a feast of fish is held, and great rejoicings take place. The eel-harvest occupies from 12 to 15 weeks; and some idea of its extent may be formed from the fact, that from the years

1798 to 1813 the annual "take" averaged close upon 2,000,000 lbs. weight. From 1813 to 1825, the average was about 1,612,600 lbs. per annum. An accident for some years greatly reduced these quantities, but the supply is again increasing, being upwards of a million pounds weight per annum. The fish are prepared for the market by partial cooking in a large kitchen built for the purpose, the eels of moderate size being roasted alive, in order to their better preservation. The larger fish are chopped into lengths, the heads and tails being sold for the benefit of the poor. Large quantities of the eels are also salted and dried. The workmen, who are lodged in barracks, and submit to a strict discipline, are allowed one and a half pounds of fish per diem. The money-value of these fisheries may be estimated from the fact, that 1 lb. weight of eel-fry will, in the course of three or four years, be worth to the cultivators of the lagoon a sum of £41 sterling.

COMAL', a s.w. co. of Texas, on the Cibolo river, and intersected by the Guadalupe; 575 sq.m.; pop. '80, 5,546—270 colored. The surface is mountainous in some parts, and about two thirds is covered with live oak and mosquito. The greater portion of the people are Germans, and agriculture is their chief occupation. Co. seat, New Braunfels.

COMA'NA, a city of Cappadocia, in a deep valley of the Anti-Taurus range, through which the river Sarus flows. C. was celebrated in ancient times as the place where the rites of the goddess Ma (the Greek Enyo) were celebrated, with much solemnity and great magnificence, in a spacious and sumptuous temple, to which the city was scarcely more than an appendage. It was governed by the chief priest, who took rank next to the king. In Strabo's time, more than 6,000 persons were engaged in the services of the temple.

COMANCHE, a co. in s.w. Kansas, bordering on the Indian territory; 720 sq.m. It is as yet unsettled. Pop. '80, 372—2 colored.

COMANCHE, a co. in n.w. Texas on the Leon river; 1050 sq.m.; pop. '80, 8,608—79 colored. The surface is undulating and well timbered. Stock raising is the leading business. Co. seat, Comanche.

COMANCHES, American Indians, of the Shoshone family, known to the French as Padouques. When first known to Europeans, they occupied the regions between the upper waters of the Brazos and Colorado on one side, and the Arkansas and Missouri on the other. In 1783, they were brought to nominal submission by the Spanish general Anza, who killed 30 of their chiefs; but they again became troublesome, and continued to harass the district of Texas until they were settled in a reservation. In 1872, a portion of the tribe known as the Staked Plain Comanches had to be reduced by military measures. In that year they numbered in all about 3,300.

COMAT'ULA. See CRINOIDEÆ.

COMAYA'GUA, a department in Honduras, 4,800 sq.m.; pop. about 80,000. The province occupies the w. central portion of the republic. The soil is rich, and well adapted to the cultivation of tropical vegetation. There are silver and copper mines, and various other minerals; and of timber there are pine, oak, mahogany, cedar, lignum vitæ, etc. In the mountains in the s.e. part of the province is a considerable population of Indians who are descended from the Lencas. The province is famous for raising superior breeds of cattle.

COMAYA'GUA (formerly VALLADOLID LA NUEVA), chief city of Honduras, Central America, 190 m. e. of Guatemala, in a fine but unhealthy valley, 1800 ft. above the sea, on the right bank of the Humuva, which flows into the Pacific. The city was founded in 1540, is the see of a bishop, has a cathedral college, ecclesiastical seminary, several convents, and a rich hospital. Pop. 8,000; it was 18,000 previous to 1827, when the city was burned by the monarchical faction of Guatemala, and has never since wholly recovered.

COMB (Sax. *camb*). Combs seem to have been used by the ancients rather for adjusting than for fastening the hair, the pin or bodkin (*acus*) having been chiefly employed for the latter purpose. Both the Greek and Roman combs were generally made of boxwood, which was obtained from the shores of the Euxine; but latterly, ivory combs came into general use amongst the Romans, as they had long before been amongst the Egyptians. The precious metals were also used for the purpose, as we may infer from the golden combs ascribed to the goddesses; but this was probably rarer in ancient than in modern and mediæval times from the circumstance of the C. not having been then used as an ornamental fastening. Of the early use of gold combs by our own countrywomen, we have a monument in the well-known ballad of *Sir Patrick Spens:*

> "O lang, lang may their ladyes sit,
> Wi' their gowd kames in their hair."

An ancient Irish long rack C. is in the museum of the royal Irish academy. The sides are hog-backed, and between them are set the pectinated portions, varying in breadth from half an inch to an inch and a quarter, according to the size of the bone out of which they were cut. The whole is fastened together with brass pins riveted. By this contrivance, any damaged portion could easily be replaced.

Combs are made of tortoise-shell, ivory, horn, wood, bone, metal, and India-rubber. The material is first made into plates of the size, shape, and thickness of the C., and then the teeth are cut. The old method of cutting the teeth is by the *stadda* or double saw, which has two blades of steel set parallel to each other, with a space between them equal to the thickness of the intended tooth. Combs with 50 or 60 teeth to the in. may be cut in this manner. The teeth are then thinned, smoothed, and finished by means of thin wedge-shaped files. Instead of hand-saws, circular-saws of similar construction have been more recently used.

Many combs are now made by a method called "parting." By the processes of cutting above described, the material corresponding to the spaces between the teeth is of course wasted; by the method of parting, this is made available to form the teeth of a second comb. The plate of horn, tortoise-shell, etc., is cut through by means of a stamping-cutter, consisting of two thin chisels inclined to each other, which represent their edges; between these, and connecting the ends is a small cross-chisel. When this compound cutter descends with sufficient force upon the plate it will cut one of the teeth. By simple machinery, the table carrying the plate is made to advance a distance equal to the thickness of one tooth while the cutter is rising, and thus the successive cuts are made. A slight pull is now sufficient to part the plate into two combs, the teeth of which only require filing and finishing.

India-rubber combs, now so extensively used, are manufactured by pressing the caou'chouc to the required form in molds, and "vulcanizing" or combining it with sulphur afterwards. By this means a high degree of hardness can be obtained.

COMB, or COOMB, an old corn measure, containing four bushels. In many localities, hollows or valleys among hills are called COMBS or COOMBS (W. *cwm*). The word is allied to the Gr. *kymbos*, a cavity; *kymbe*, a vessel.

COMBACO'NUM, a t. in s. India 20 m. from Tanjore, and 30 m. from the sea; pop. 40,000. It is a large town, with wide streets, and is adorned with pagodas, gateways, and other edifices of considerable pretension. The gate pyramid is a building of 12 stories rising more than 100 ft., and is ornamented with a profusion of figures of men and animals done in stucco. One of the water tanks in the town is reputed to be filled with water taken from the Ganges once in 12 years, by a subterranean passage 1200 m. long. There is considerable trade, and weaving is one of the chief industries. The city was once the capital of the Chola race, an old Hindu dynasty.

COMBAT, SINGLE, the "Holm-gang," or island duel of the old Norsemen. A great many quarrels were settled by single combat, when, to guard against interference, the principals went alone to some small island (or holm), and there settled their quarrel by strength and skill. The idea is as old as war. In the Bible we read of Goliath challenging any Israelite to single strife. In the Iliad, Ajax challenges any opponent, and furthermore defies heaven. It was not uncommon in England, and was particularly invoked in charges of treason. The idea finds its modern and despicable expression in dueling.

COMBE, ANDREW, M.D., brother of the following, was b. in Edinburgh, Oct. 27, 1797. He studied medicine there and at Paris, and in 1823 commenced to practice in his native city. In 1836, he received the appointment of physician in ordinary to the king of the Belgians, but his delicate health prevented him from retaining this office; and on returning from Brussels, he continued to act only as consulting-physician to his majesty. Afterwards, he became one of the physicians in ordinary to queen Victoria in Scotland. He died at Edinburgh, Aug. 9, 1847. His principal works are—*Observations on Mental Derangement* (1831); *The Principles of Physiology applied to the Preservation of Health*, etc. (1834; 15th ed. 1860); *The Physiology of Digestion considered with Relation to the Principles of Dietetics* (1836; 10th ed. 1860); and *The Management of Infancy, Physiological and Moral* (1840, 9th ed. 1860), revised by sir James Clark; 10th ed. 1870). Mild, benevolent, and wise, Andrew C. obtained the esteem and admiration of all who could appreciate purity and excellence of character. In his *Life and Correspondence*, published by George Combe in 1850, we find not only a vivid picture of the man, but an example of patient adherence to physiological principles in the treatment of a delicate constitution, with the result of prolonging a useful life far beyond what he had ventured to hope for. The record of the means by which he combated a serious pulmonary disease for nearly 30 years at home and abroad, is calculated to be highly instructive to persons similarly afflicted. His death was probably hastened by exposure to the poisonous air of an emigrant ship, in which he made a voyage to America: the experience gained on this occasion led him to proclaim, through the *Times*, the urgent necessity of a law regulating the sanitary arrangements in emigrant vessels. The long letter which he wrote on this subject appeared on Sept. 17, 1847, a month after his death, and erelong the act 12 and 13 Vict. c. 23, provided a remedy for the evil. Dr. C. also exerted himself successfully for the improvement of medical education. A list of his contributions to the *Phrenological Journal* and the *British and Foreign Medical Review* is appended to his *Life*. His character as a man, a physician, and a writer, is affectionately depicted by his friend sir James Clark, in an introduction to the 9th edition of *The Management of Infancy*.

COMBE, GEORGE, a well-known phrenologist and moral philosopher, was b. Oct. 21, 1788, in Edinburgh, where he was educated. Entering the legal profession, he became a writer to the signet in 1812, and continued to practice until 1837, when he resolved to devote himself to scientific pursuits, for which he had always manifested a predilection. As early as 1816, he made the acquaintance of Dr. Spurzheim, while the latter was on a visit to Scotland, but at first regarded his phrenological system with aversion. Investigation, however, convinced him that phrenology was based on fact. The result was his *Essays on Phrenology* (1819). Five years later, appeared his *System of Phrenology*, which became very popular, and reached a fifth edition in 1843; besides being reprinted in America, and translated into French and German. But his most important production is *The Constitution of Man considered in Relation to External Objects* (1828; 9th ed. 1860). This work endeavors to demonstrate, what it is strange should ever have been denied, the essential harmony of the nature of man with the surrounding world, and the necessity of studying the laws of nature, in order that we may realize the advantages of the external world, lessen our exposure to outward evils, and carry out successfully man's physical, moral, and social improvement. C.'s doctrines were violently opposed, being considered by many as inimical to revealed religion: but now that the heat of controversy has cooled, it is seen that, in their main aspects, they were not liable to the objections urged; and they are, to a large extent, adopted in the physico-social reforms of the present day. Nearly 100,000 copies of the work have been sold in this country; numerous editions have been printed also in America, and it has been translated into French, German, and Swedish. C. contributed largely to the *Phrenological Journal* (20 vols., 1824–47). He traveled in Germany and America, and published *Notes* of his experiences. His death occurred on 14th Aug., 1858. Mr. C. married, in 1833, Cecilia, daughter of the celebrated Mrs. Siddons; by whom he was survived. Besides the works mentioned, he wrote *Elements of Phrenology* (1824; 9th ed. 1862); *Lectures on Popular Education* (1833; 3d ed. 1848); *Moral Philosophy* (1840; 3d ed. 1846); *Life and Correspondence of Andrew Combe, M.D.* (1850); *Principles of Criminal Legislation and Prison Discipline* (1854); *Phrenology applied to Painting and Sculpture* (1855); and *The Currency Question considered in Relation to the Bank Restriction Act, 7 and 8 Vict. c.* 32 (1855; 8th ed. 1858), etc. The latest of his works—in which the importance of natural religion, and the duty and advantage of obedience to its precepts, are eloquently enforced—is on *The Relation between Science and Religion* (1857). Endowed with great activity and an earnest apostolic spirit, C. was fond of lecturing on his favorite subjects, and delivered many successful courses not only in various parts of the United Kingdom, but in the United States, and even in Germany. As a citizen, he took a zealous part in promoting parliamentary reform, the abolition of the corn laws, and a system of national education available to every sect on equal terms. His collection of books on phrenology was given to the advocates' library in Edinburgh. See the *Life* by Charles Gibbon (1878).

COM'BERMERE, VISCOUNT (Stapleton Stapleton-Cotton), a British field-marshal, son of sir Robert Salusbury Cotton, baronet, of Combermere abbey, Cheshire, was b. in 1773 at Llewenny hall, Denbighshire. Educated at Westminster school, he, in Feb., 1790, entered the army, and distinguished himself in India at the battle of Mallavelly and the siege of Seringapatam. In 1807—in which year he succeeded his father in the baronetcy—he proceeded, with the rank of maj. gen., to the peninsula, in command of a brigade of cavalry; and in 1810 was appointed to the command of the whole allied cavalry under the duke of Wellington. He was present at the battles of Talavera, Fuentes de Onoro, Salamanca—where he was second in command, and was severely wounded—the Pyrenees, Orthes, and Toulouse. For his brilliant services in the peninsular war, he repeatedly received the thanks of parliament, and in May 17, 1814, was raised to the peerage as baron Combermere. Although not at Waterloo, he had the command of the cavalry of the army of occupation in France ; and in 1817 was appointed governor of Barbadoes, and commander of the forces in the West Indies. In 1822, he became commander-in-chief in Ireland; and in 1825 was nominated commander of the forces in India. In that position, he achieved the capture of the strong and almost impregnable fortress of Bhurtpore; and, Dec. 2, 1826, was raised to the rank of viscount. In 1834, he was sworn a privy councilor; and in Oct., 1852, succeeded the duke of Wellington as constable of the Tower of London and lord-lieutenant of the Tower Hamlets. In 1855, he was made field-marshal. He died in 1865.

COMBINA'TION means the act of uniting or combining certain active elements; and it has come lately, in the legal and political phraseology of England, to mean the uniting together of persons having a common interest, with a view to promoting that interest. Thus, it may refer to employers uniting together to keep up prices or keep down wages; or it may apply to workmen uniting together to keep up wages. The word is now almost exclusively used in relation to the proceedings of the working-classes for retaining a monopoly of certain occupations, or for keeping up wages above their natural amount. C. is one of the most obvious, and, in certain circumstances, one of the most justifiable and beneficial arrangements. Like all other human institutions, it has its good and bad shape—the former, when it is used for protection ; the latter, when it is used for oppression. It is a practical exemplification of the precept taught by the

old man in the fable, when he recommended union to his sons by showing that the bundle of sticks could not be broken, but that each stick could be easily snapped when separated. The municipal corporations were combinations to protect the citizens against the power of the aristocracy, and a group of these municipal corporations formed themselves into a larger C., well known as the Hanse towns, whose united influence not only braved the aristocracy, but exceeded that of many of the European monarchies. The guilds and other societies, whether of merchants or artisans, were combinations established for protection in violent times; though they were employed to further monopoly and interfere with freedom of trade, when more equal laws, and a higher social civilization, rendered them unnecessary for mere protection from external oppression. The free-masons are a relic of a great guild, or secret society, pervading all Europe. The similarity to each other of contemporary Gothic buildings, however far apart, is explained by the circumstance that they were built by a large C. of workmen, who all learned in the same school the same rules of art, and who had secret arrangements which enabled them to work together, and preserve the monopoly of the building-trade.

The oppressive laws to which the working-classes, even in this country, were subjected, fully justified them in combining for their own protection. The nature of those laws is explained, though not justified, by the fact that they were less oppressive than the institutions of other countries where the working-classes were in actual serfdom; and that they mark, in reality, the steps of progress onwards from the state of slavery or serfdom in which all the working-classes were of old involved, even in this country. The boasted freedom of our Saxon ancestors was, indeed, very similar to that of the southern states of North America before the late civil war, since it was all enjoyed by the upper class, to whom the inferior persons were slaves; and the term freeman, still used in certain municipalities, of old distinguished those who were not slaves The statutes of labor still retained a portion of this servitude, laying heavy penalties on workers in the various trades who refuse to work at a regular fixed remuneration—often, of course, below the market value, otherwise it would not require to be protected by penalties. By the poor law act, too, those who would not work might be veritably enslaved by being compelled to labor in the service of any householder. It may be said, indeed, to be the last stage of the emancipation of the working-classes from slavery when the C. act was repealed in 1825. This act, which, after all, was a mild relic of the old laws for coercing workmen, subjected those who, whether verbally or in writing, entered into combinations for keeping up the wages of their labor, or limiting the hours of work, to be punished by imprisonment as criminals. There is no doubt that, in defiance of this act, secret combinations were held of a more dangerous and cruel character than any which have occurred since the repealing act of 1825, which rendered C. itself lawful, but punished any attempts to enforce the views of the combining workmen by violence or intimidation.

Both by the law of the land, and the public opinion on which it rests, it is now allowable for any class of men to combine together for the purpose of fixing the price at which they shall buy or at which they shall sell, provided their C. be entirely voluntary, and subject no one to coercion. All the landlords of a state, for instance, might combine to keep up the price of grain; but if they should get a law to enable them to exact this price by prohibiting any of their body from selling for less, or for prohibiting or limiting the importation of foreign grain, then their C. would be oppressive. In like manner, a hundred bricklayers or a hundred tailors may combine not to work for less than a certain remuneration, or not to work more than a certain number of hours daily; and they are quite free to do so, provided they do not compel any one to join their C., or do not interfere with those who are content to work on lower terms. The difficulty is to define compulsion.

Royal commissioners appointed to inquire into the subject of trade-unions and combinations of workmen in 1869 and 1875, gave an account of the history and working of the modern law, and its modifications from time to time. In 1871, two acts were passed for the purpose of consolidating and settling the law; these were supplemented by the trades-union act amendment act, 1876, which more fully defines the nature of the combinations to which the acts apply, the rights of members in certain events, and imposes conditions in reference to registration. 34 and 35 Vict. c. 31, defined what trade-unions were to be deemed unlawful, and when their contracts were not enforceable, and provided for the legislation of trade-unions, and the protection of their property. The other act 34 and 35 Vict. c. 32, repealed all the former laws as to violence, threats, and molestation; but it has now been repealed by the conspiracy and protection of property act, 1875, 38 and 39 Vict. c. 86, which applies to the United Kingdom. The leading characteristic of this act was to abolish, as much as possible, the appearance of exceptional legislation as to the mutual relations of workmen and their trade-unions, and to make general rules applicable to all businesses and occupations. It was declared that an agreement or combination by two or more persons to do, or procure to be done, any act in contemplation or furtherance of a trade dispute between employers and workmen, shall not be indictable as a conspiracy, if such act committed by one person would not be punishable as a crime. Before that statute, what was innocent when done by one person became indictable when done by three or more simultaneously.

The law relating to compulsion or intimidation is now generalized, as follows: Every

person who, with a view to compel any other person to abstain from doing or to do any act which such other person has a legal right to do or abstain from doing, wrongfully and without legal authority (1) uses violence to, or intimidates such other person, or his wife or children, or injures his property; or (2) persistently follows such other person about from place to place; or (3) hides any tools, clothes, or other property owned or used by such other person, or deprives him of, or hinders him in the use thereof; or (4) watches or besets the house or other place where such other person resides or works, or carries on business, or happens to be on the approach to such house or place; or (5) follows such other person with two or more other persons in a disorderly manner, in or through any street or road—may either be indicted or punished summarily by justices of the peace, and fined £20, or imprisoned for three months with hard labor. But any person charged before justices is entitled to object to their jurisdiction, and claim a trial before a jury. If he is convicted by justices, he may appeal to quarter sessions. In Scotland, the offense can only be prosecuted by the procurator-fiscal or lord-advocate in the sheriff court or court of justiciary. Though breaches of contract by workmen are not now punished criminally, they are so in case of gas and water supply.

COMBINATION, LAWS OF, in chemistry. See ATOMIC THEORY.

COMBINATIONS, in mathematics. See PERMUTATIONS.

COMBING, of wool, cotton, etc. See CARDING.

COMBRETA'CEÆ, a natural order of exogenous plants, consisting of trees and shrubs, all natives of tropical countries It contains about 200 known species, most of which are characterized by astringency.

COMBUSTION is the term applied to the process of burning, which usually consists in the oxygen of the air uniting with the constituents of the combustible substance. Thus, the C. of coal is due to the oxygen of the air passing into a state of chemical union with the carbon and the hydrogen of the coal, forming carbonic acid (CO_2) and water-vapor (HO). Such chemical combinations are always accompanied by the production of more or less heat, as in the case of decaying wood and other vegetable matter; but it is only when the action is so rapid as to evolve intense heat accompanied by light, that the process is called burning or combustion. Though the gaseous oxygen has as much to do with the process as the more solid material, coal, wood, paper, or cloth, yet the latter is alone styled the *combustible* or *burning body*, whilst the oxygen is invariably named the *supporter* of combustion. A few substances burn at ordinary temperatures, such as phosphorus, which glows when exposed to the air; but the generality of substances, such as wood, coal, etc., require to be raised in temperature or be set fire to before they possess the power of combining with the oxygen of the air. The amount of heat given out by the various combustibles when burned, is capable of being measured, and is definite. The same weight of the same combustible invariably evolves the same amount of heat during its complete C.; but different combustible substances give off different amounts of heat. The mode in which the heat evolved may be measured, is either (1.) To observe the quantity of ice which a given weight of the combustible will melt when burning; (2.) To notice the weight of water which the combustible will convert into steam; or (3.) To estimate the number of pounds of water which the burning body will raise from 32° to 212° F. The last plan is the more easily managed and accurate, and serves as the index in the following table, which gives the number of pounds of water raised from 32° to 212° F. during the C. of one pound of each of the burning bodies:

Charcoal, pure	78	lbs. of water.
" from wood	75	"
Wood, dried	36	"
" undried	27	"
Coal, bituminous	60	"
Turf and peat	25 to 30	"
Alcohol	67½	"
Olive oil, wax, etc	90 to 95	"
Ether	80	"
Hydrogen	236½	"

The amount of heat evolved appears, however, to be proportional to the quantity of oxygen required to burn the various combustibles. Thus, when a similar volume of oxygen gas, or even ordinary air, is allowed to flow against the various combustible substances, the following results are obtained:

One lb. oxygen combining with	Raises from 32 to 212 degrees F.
Hydrogen	29½ lbs. of water.
Charcoal	29 "
Ether	28 "
Alcohol	28½ "

While the absolute amount of heat evolved during the C. of any burning body is the same, yet the sensible heat may vary according to the rapidity of the process. Thus,

when phosphorus is exposed to the air at ordinary temperatures, it very slowly combines with oxygen, and gives out little heat at any one moment, but it is diffused over a great length of time; whilst if the phosphorus is set fire to in the air, it burns vividly, and gives out much heat and light for a short time; and still further, if the burning phosphorus be placed in pure oxygen, it enters into most vivid C., and evolves a most intense heat and brilliant light for a still shorter time. In the latter instances, the heat evolved at any one moment is greater, because more rapid, than that given off at the same time during the slower process of C.; but when allowed to proceed to a termination, there is as much heat produced during the whole time occupied in its development. The same remark applies to the coal placed in a furnace. So long as the door of a furnace is open, and there is little draft of air through the fuel, a moderate amount of heat is evolved, which may last for several hours; but when the door is shut, and much air is drawn through the coal, the latter is more quickly burned, and more heat is evolved during a shorter period of time than before, but in the long-run there is the same amout of heat evolved.

COMEDY. See DRAMA.

COME'NIUS, JOHN AMOS, the most distinguished educational reformer of the early part of the 17th c., was b. on the 28th of Mar., 1592, according to some, at Comna, near Brünn; according to others, at Niwnitz, in Moravia. His parents belonged to the community of the Moravian Brethren. C. studied at Herborn, and then at Heidelberg, after which he traveled through Holland and England, and at last settled at Lissa, in Poland, where he was chosen bishop of the Moravian Brethren. In 1631, he published his *Janua Linguarum Reserata,* which was translated into many European, and even into some Oriental languages. In this work, he points out a method of learning languages new at that time, which may be called the intuitive or perceptive system, in which the pupils were taught by a series of lessons on subjects easily understood or appreciable by the senses—such as natural history, the sciences, different trades and professions, etc. C. also published about the same time the *Ratio Disciplinæ Ordinisque Ecclesiæ in Unitate Fratrum Bohemorum* (1632), republished with remarks by Buddæus (Halle, 1702); and his *Pansophiæ Prodromus* (1639). In 1641, C. was invited to England, to assist in reforming the system of public instruction; but as the breaking out of the civil war prevented the execution of this design, he went to Sweden, where he was patronized by Oxenstiern, who gave him a commission to draw up a plan for the organization of schools in Sweden, which he completed at Elbing, four years afterwards. He next went to Hungary for a similar purpose. Here he composed his celebrated *Orbis Sensualium Pictus,* or The Visible World (Nürn. 1658), the first picture-book for children, which has been often reprinted and imitated. Finally, he settled in Amsterdam, where he published several other works. C. died at Naarden, on the 15th Oct., 1671. In the latter years of his life, C. gave way to fanaticism, misinterpreted the Revelation of St. John to suit his fancies of the existing state of Europe, and expected the millennium in 1672. An interesting account of the wanderings and sufferings of C., and of his great services in the cause of popular education, is given in K. G. von Raumer's *Geschichte der Pädagogik.*

CO'MÉS, an ancient officer, with territorial jurisdiction. See EARL.

COMET. The word C. is derived from the Gr. *kômē,* hair, a title which had its origin in the hairy appearance often exhibited by the haze or luminous vapor, the presence of which is at first sight the most striking characteristic of the celestial bodies called by this name. The general features of a C. are—a definite point or nucleus, a nebulous light surrounding the nucleus, and a luminous train preceding or following the nucleus. Anciently, when the train preceded the nucleus—as is the case when a C. has passed its perihelion, and recedes from the sun—it was called the beard, being only termed the tail when seen following the nucleus as the sun is approached. This distinction has disappeared from all modern astronomical works, and the latter name is given to the appendage, whatever its apparent position. Neither this luminous attendant, the tail, nor the nucleus, is now considered an essential cometary element, but all bodies are classed as comets which have a motion of their own, and describe orbits of an extremely elongated form. There are several plain points of difference between comets and planets. The planets move in the same direction, from w. to e., which is astronomically called "direct motion;" but the movements of comets are often from e. to w., or retrograde. The orbits of all the planets are confined to a zone of no great breadth on either side of the ecliptic; but the paths of comets cut the ecliptic in every direction, some being even perpendicular to it. The orbits of all the planets are nearly circular; or, more properly speaking, are ellipses of very small eccentricity. The orbits of comets, on the other hand, present every variety of eccentricity, some of them being ellipses or elongated closed orbits of various degrees of elongation; others, hyperbolas; while the majority have a form of orbit not differing sensibly from the parabola, which is the limiting form of curve to which both the ellipse and hyperbola approximate, under given conditions.

Any attraction, however, of an extraneous body interfering with the attraction of the sun might change the orbit from the ellipse to the hyperbola, and *vice versâ,* or from the parabola to either. As, however, there is only one parabola corresponding to

infinite sets of ellipses and hyperbolas, an interfering cause is not likely to change the orbit from an ellipse or hyperbola to the parabolic form. Of about 200 comets whose orbits have been obtained with more or less accuracy, 40 appear to have described ellipses, 7 hyperbolas, and 150 orbits that cannot be distinguished from parabolas.

The discovery that comets are celestial bodies, extraneous to our atmosphere, is due to Tycho Brahé, who ascertained the fact by observations of the C. of 1557. Newton succeeded in demonstrating that they are guided in their movements by the same principle which controls the planets in their orbits; and Halley was the first, by determining the parabolic elements of a number of comets from the recorded observations, to identify the C. of 1682 with one which had been observed in 1607 and the observations recorded by Kepler and Longomontanus, and also with a C. observed in 1531 by Apian, at Ingoldstadt, and thus confidently to predict the return, at the end of 1758 or beginning of 1759, of a C. which would have the same parabolic elements. These parabolic elements are elements of a parabola nearly coincident with the elongated elliptic orbit of the comet. They are—1. *The inclination.* 2. *The longitude of the node.* These two determine the plane of the orbit. 3. The longitude of the *perihelion*, or point of nearest approach to the sun. 4. The perihelion distance, or nearness of approach to the sun, 5. The direction of motion, whether *direct* or *retrograde.*

To determine these parabolic elements, three observations of the C. are sufficient; and by a table of such elements deduced from the recorded observations, it is possible at once to ascertain whether any newly observed C. is identical with any that have been previously observed. To predict, however, with accuracy the time of the return of a C., a much more accurate calculation must be made of the orbit, taking into account the perturbations of the planets to whose influence it is subject. This difficult problem was solved, in the case of Halley's C., by the joint work of Laland, Mme. Lepante, and Clairaut, who announced, in Nov., 1758, just as astronomers began to look out for the return of the C., that it would take 618 days more to return to the perihelion than on the preceding revolution. The perihelion passage was fixed about the middle of April, 1759; but Clairaut distinctly forewarned the world that, being pressed for time, he had neglected small values, which collectively might amount to about a month in the seventy-six years. The C. passed the perihelion on the 12th Mar., 1759, exactly a month before the time announced, but within the assigned limits of divergence from that date. The elements of its orbit proclaimed it to be the C. of the former periods by their similarity. For the next perihelion passage, the different calculations executed by MM. Damoiseau and De Pontécoulant, fixed the 4th, the 7th, and the 13th Nov., 1835. Subsequently, observations indicated the 16th—that is to say, a deviation of only three days from what turned out the most accurate calculation, and a deviation of 12 days from the most remote. We have adverted to the perihelion passages of this C. in 1531, 1607, 1682, 1759, and 1835. It is also now identified with a C. observed in 1456, and one in 1378, recorded by Chinese observations. There are no sufficiently reliable European observations previous to 1456, but it is conjectured by Arago, that this C. is the same with the C. of 1305; that of 1230; a C. mentioned in 1006 by Hali Ben Rodoan; that of 885; finally, a C. seen in the year 52 before our era.

This account of Halley's C. has been given at length, to illustrate the principles on which the calculations are made. There are three other comets whose periodicity is established, and whose paths are accurately known:

1. That of Encke, with a short period of 1204 days. Its orbit does not extend so far as the orbit of Jupiter, and a slight acceleration in its periodic times of return has suggested the possibility of the space, within our solar system at least, being occupied by a resisting medium, though of extreme rarity.

2. That of Biela or Gambart, having a period of six years and three quarters. During the visit of this C., in 1846, it was seen to separate into two distinct comets, which kept moving side by side till they disappeared. On the return of the C. in the autumn of 1852, the distance between the two nuclei had much increased. Since then, although twice due, it has not again been seen.

3. That of Faye, with a period of seven years and a half.

The orbits of both these last extend beyond the orbit of Jupiter, but not so far as that of Saturn.

The above are the only comets whose orbits are considered by astronomers as established, although there are others whose orbits are ascertained with a less degree of accuracy and certainty, requiring the test of future returns to fix their periodicity. One other deserves mention from the great peculiarities of its course.

In the month of June, 1770, Messier discovered a C. which remained visible a long time, and enabled Lexell to ascertain the orbit to be an ellipse whose major axis was only three times the diameter of the earth's orbit, and corresponded to a periodic revolution of 5½ years. This result suggested grave difficulties. It had been found impossible to identify this C. with any previously observed, and yet it was difficult to conceive that a bright C., with so short a period of return, should have previously escaped observation. What was still more remarkable, it was never seen again, though anxiously looked for in the places where Lexell's orbit would have brought it. It became popularly called Lexell's lost C., and gave occasion to many sarcasms by the wits of the day at the expense of astronomers, who had so much boasted of having found the key

to the cometary movements. In the present day, the explanation is complete. The C. was never seen before 1770, because its orbit previously had been totally different, its nearest point to the sun having been as distant as the path of Jupiter. Its appearance that year arose out of the fact that in 1767 it was in such close contact with Jupiter, moving in the same direction, and nearly in the same plane, that the attraction of this planet entirely changed its orbit. But why has the C. not since been seen? Its passage to the point of perihelion in 1776 took place by day; and in 1779, before another return, it again encountered the vast body of Jupiter, and suffered a fresh orbital derangement, the attraction of the planet deflecting it into more distant regions, and so changing the form of the orbit, that if it had again been visible, it would not have been recognized as identical with Lexell's comet.

The celebrated C. of 1680, which furnished Newton with the occasion for proving that comets revolve around the sun in conic sections, and that, consequently, they are retained in their orbits by the same force as that which regulates the movements of the planets, appears to have been about the most remarkable for brilliancy of any of which we have authentic accounts. This C. is supposed to be identical with the one that appeared about the time of Cæsar's death (44 B.C.), with that which was seen in the reign of Justinian in the year 531, and with another in the year 1106, in the reign of Henry II., the period of revolution, according to the orbit calculated for it by Whiston, being about 575 years. There is, however, some doubt among astronomers as to the real form of its orbit, the one assigned to it by Encke giving it a period of 8,813 years. This C. approached nearer to the sun than any known, except perhaps the C. of 1843, the calculation of whose perihelion distance, from the paucity of observations, has little certainty. The C. of 1680 approached the sun within the 163d of the semi-diameter of the earth's orbit. The tail of a comet is nearly always away from the sun, frequently assuming a curved form. It increases in length with its proximity to the sun, but does not acquire its greatest length till after passing the perihelion. These are usual characteristics of comets, which were exemplified by this one in a remarkable degree. These phenomena might be accounted for if we were to regard the train as vaporization produced by the intense heat to which the body of the C. is exposed in its approach to the sun.

In the present century, the comets most remarkable for brilliancy have been the C. of 1811, that of 1843, and that of 1858 (Donati's).

Spectroscopic investigation, so far as yet pursued, points to the conclusion that the nucleus is self-luminous, but that the tail shines with reflected light. It has been discovered recently, in determining the tracks of those streams of dark bodies that cause meteoric showers, that some of the tracks coincide with the orbits of well-known comets. From this, it is inferred that star-showers and comets may be only different manifestations of the same thing. See METEORS.

What the matter of the comets consists of is, of course, only a subject for speculation. The composition of the nebulosity and the tail is, at all events, something of almost inconceivable tenuity, as shown by three consideration. 1. Stars seen through them suffer no diminution of brightness, though the light must have to traverse sometimes millions of miles of the cometary atmosphere. 2. Though the thickness of the tail of a C. may be millions of miles, and its length of course much greater, the comets have never been observed to cause any sensible disturbance of the planetary motions, though approaching near enough to be themselves so much affected as to change the entire character of the orbit. 3. The curvature of the tails, and the acceleration of the periodic time, in the case of Encke's C., indicate their being affected by a resisting medium, which has never been observed to have the slightest influence on the planetary periods, though so long observed. Even the nuclei of comets appear to be of extremely small density. This may be inferred, though with less force than regards the tails, from the two last considerations above mentioned; and, moreover, there are reliable accounts of stars of a very low order of magnitude being seen through the nuclei themselves.

Comets have been alternately regarded with terror and with welcome in the popular mind. The appearance of Halley's C., in 1456, just as the Turks had become masters of Constantinople, and threatened an advance into Europe, was regarded by Christendom with a superstitious dread, and to the Ave Maria was added the prayer: "Lord save us from the devil, the Turk, and the comet." At Constantinople, the occurrence of a lunar eclipse at the same time, increased the portentousness of the event. The discoveries of science of the magnitude of the space filled by their bodies, and their prodigious velocity, together with the confessed impossibility of always predicting their approach, produced fears of another kind, which have sometimes been, especially in France, extravagantly exaggerated in the public mind. The groundlessness of such alarms from the extreme improbability of collision with the nucleus, the probable innocuousness of a contact with the extremely attenuated surrounding matter, and, possibly, to the greater part of the world, of a collision with the nucleus itself, will be sufficiently evident from what has been said above. It is probable that already, on many occasions, some of the attenuated vapor in the tail of comets must have come within the earth's attraction, and been absorbed in its atmosphere. Whether the effect is deleterious or salubrious, or whether it has any perceptible influence at all, is only matter of

speculation. The salubrity of cometary influence is now a popular idea; and the vintages of 1811 and 1858 were favorable seasons, whose produce is often advertised as the C. wines. It is scarcely worth while, however, to follow further speculation on these subjects, and it has been considered preferable to confine this article chiefly to the description of the general characteristics of comets, and the facts respecting them afforded by science.

COMET-FINDER, a telescope having a wide field of view but rather low magnifying power, used in searching for comets.

COMFORT, GEORGE FISK, b. New York, 1833; a graduate of Wesleyan university, especially known as a teacher. He was one of the leaders in organizing the American philological association, and also in establishing the metropolitan museum of art in New York, and has held a number of professorships. He is the author of a text-book for the study of German, and various essays upon linguistic and æsthetic subjects.

COM'FREY, *Symphytum*, a genus of plants of the natural order *boragineæ*, distinguished by a 5-cleft or 5-partite calyx, and a corolla enlarged upwards, its throat closed by awl-shaped scales. The species, which are not numerous, are natives of Europe and the n. of Asia. They are perennial plants of coarse appearance, although occasionally to be seen in flower-borders. *S. officinale* (the COMMON C.) and *S. tuberosum* are natives of Britain, frequent in shady and moist places. *S. officinale* was formerly much esteemed as a vulnerary, on account of its astringency. Its young leaves and its blanched shoots are also occasionally used as boiled vegetables. The prickly C. (*S. asperrimum*), a native of Siberia, 6 to 10 ft. in height, has been highly recommended for feeding cattle.

COMINES, or COMYNES, PHILIPPE DE, Sieur d'Argenton, a French statesman, and the author of some very interesting and valuable *Memoirs*, was b. at the castle of Comines, not far from Lille, in 1445. After receiving a careful education, he passed into the court of Burgundy about 1466, and attached himself particularly to Charles the bold (then comte de Charolais). In 1472, C., who was anything but punctilious in his notions of honor, entered the service of Louis XI., the rival and enemy of Charles, who immediately covered him with honors, and made him one of his most confidential advisers. He proved himself a very suitable agent for carrying out the designs of the crafty monarch; but after the death of Louis, by his adherence to the party of the duke of Orleans, C. incurred the displeasure of the government of Anne of Beaujeu, and was sentenced to a forfeiture of a fourth of his estates and to ten years' banishment. This punishment, however, does not seem to have been carried out, for after a few years we find C. again employed in important affairs of diplomacy. Though engaged in the service of Charles VIII. and the duke of Orleans, afterwards Louis XII., C. failed to win the confidence of these masters. He died at his castle of Argenton, Oct. 17, 1509. C.'s *Memoirs* are admirably written, and afford abundant proof that he possessed a clear, acute, and vigorous mind. He seems to have looked keenly into the heart of every man who crossed him in life, and with cool, severe anatomy, dissects him for the benefit of posterity. The best edition of his *Memoirs* was edited by Lenglet Dufresnoy (4 vols., London, 1747).

COMI'SO, a t. of Sicily, in the province of Syracuse, about 40 m. w.s.w. of the city of that name. It has paper manufactures, and a pop. of (1871) 16,694.

COMITAN', or COMITLAN, a t. in the state of Chiapas, Mexico, about 40 m. s.e. of San Cristobal. It has a fine church and a convent dedicated to St. Domingo. Agriculture is the chief occupation of the people.

COMI'TIA (Lat. *cum*, with or together, and *ire*, to go) were the legal or constitutional meetings of the Roman people, convened by a magistrate, for the purpose of putting a question to the vote. This definition at least comprehends all the C., except the *C. calata*, where the people were merely present as spectators. There were several kinds of C. (*C. centuriata*, *C. tributa*, etc.) held for different purposes; and according to the mode of constituting the C., the preponderance lay with the patricians or with the plebeians.

COMI'TIA (*ante*). It was a fundamental principle of the Roman constitution that the supreme power was inherent in the citizens, though it might be delegated by them to hereditary or to elected magistrates. All important matters, however, had to be brought before the sovereign people, who could either ratify or reject, but without discussion, the proposals made to them. Such, at least in theory, and, during the best days of the republic, in practice also, was the function of these popular assemblies. As may be readily understood, different elements had the ascendancy among the Roman people at different periods of their history. So far as it was possible for a state exposed to so many and such various influences to be conservative of its political traditions, Rome, whether monarchical, republican, or imperial, was essentially so. But, under the force of circumstances, from time to time innovations were introduced which materially altered the position of the two political parties—the patricians and the plebeians—into which the state was early divided, and by whose dissensions it was long distracted, and in none of her institutions can the progress of the struggle between these rising factions be more clearly traced than in the motive and power of those assemblies, or comitia, by which the supreme authority of Rome was in succession wielded. It is

usual to describe the Roman comitia as of three kinds, named from the mode in which the people were organized and in which they voted—the comitia curiata, or assembly of the curiæ; the comitia centuriata, or assembly of the centuries; and the comitia tributa, or assembly of the tribes. To these some add a fourth, the comitia calata (from calare, to call); but as this assembly had neither political functions nor a separate organization, it is unnecessary to do more than mention the name.

1. Comitia Curiata.—The assembly of the curiæ is believed to have been coeval with the rise of Rome itself, and its origin is therefore rightly ascribed by tradition to the mythical founder of the city. The system seems to have been an essential part of the communities, of which Rome was originally only one. Its primary object cannot now be satisfactorily determined; but the purpose for which it came to be employed is sufficiently clear. From a very early period the Roman curiæ, or "wardships," as they may be called, numbered 30, being 10 for each of the three once independent communities—the Rhamnians, the Tities, and the Luceres—from whose amalgamation the Roman people sprang. At first, these curiæ were probably made up extensively of the freeholders, or patricians, as the freeholders were afterwards designated, on whom devolved exclusively the right and the duty of bearing arms. It has been maintained by some that the class of dependents called by the Roman writers clients, as well as the burgesses or citizens, had a right to vote in the assembly of the curiæ. No direct evidence, however, can be brought forward in support of this supposition, which, in the nature of the case, is highly improbable; and, if allowed to be present at all, they were very likely nothing more than spectators, or, as their name is said to imply, "listeners." In an assembly each had one vote, and determination was by the majority of the individual voters in the different curiæ. As the number of the latter was even, and no provision was made for deciding in case of there being an equal division on any question, it would seem as if this function had not been thought of in fixing the number of the curiæ, or had been subordinated to some other consideration.

2. Comitia Centuriata.—By the operation of obvious causes, a great increase soon took place in the number and influence of the dependent members of the Roman commonwealth. As a natural consequence, the way was paved for a reform of the constitution, though we may well conceive that the step was hastened by the gradual thinning of the ranks of the old freeholders in the incessant wars in which Rome found herself involved with her neighbors. Thus, in the course of time a new class, the plebeians of history, arose out of the clients, preponderating in numbers, and by no means destitute of wealth. Though this class had not, perhaps, the rights of citizens, it was exempt from service in the field; and while the political inferiority of its members must have been galling, their immunity from the chances of war can hardly have been looked upon with equanimity by the ruling faction. It was to redress this twofold grievance that the reform ascribed to king Servius Tullius is generally believed to have been effected. But the whole scheme was one skillfully devised to assign duties to the plebeians rather than to bestow upon them rights, and it was evidently the work of a statesman who was in the interest of the patricians. The chief authorities for the details of the arrangement are Livy and Dionysius, whose accounts, though they differ in some particulars, agree in the main. We must bear in mind, however, that both of them describe the assembly of the centuries rather as it existed in their own day than as it was first constituted. Livy gives the whole number of the centuries as 194; Dionysius makes them 193. The voting in the assembly was by centuries, each possessing a collective vote exactly as in the case of the curiæ. It was so arranged that the 18 centuries of equities and the 80 centuries of the first class voted first. If they were agreed upon a question at issue, the other side were not called upon to vote at all. As the centuries, though nominally "hundreds," probably contained in the first class fewer, and in some of the other classes certainly many times more than that number, it is plain that in the assembly by far the largest share of power was retained in the hands of the wealthy, of whom the original burgess element would long form the main portion. How far we have in this scheme merely a modification of an earlier arrangement, there are no means of determining. As Mommsen remarks, it is more than probable that the original assessments were laid upon land. Be this as it may, the Servian reform was originally a new military rather than a new political organization, its author intending that the privileges of the patricians assembled in the curiæ should remain as before. But its results were different from what had been anticipated. By a process easily understood, the rights of the curiæ gradually passed to the centuries. The assembly of the former continued, indeed, to meet, but the assembly of the latter became thenceforth the chief guardian of the rights of the Roman people.

3. Comitia Tributa.—The further development of the democratic element in the Roman constitution, consequent on the change just described, soon led to a demand for greater changes in the same direction. The tribunes of the people, now the acknowledged leaders of the democracy, took advantage of an ancient division of the original territory of Rome into tribes, to give greater prominence to this element than it had yet possessed. These tribes, 30 and afterwards 35 in number, which, as is supposed by some, had already supplied a basis for the arrangement into curiæ as well as classes, seem to have at first existed for purely local purposes. But the leaders of the people succeeded at length in forming them into a political union entitled to exercise certain func-

tions, chief among which was the election of the inferior magistrates, and the approval and rejection of such legislative measures as affected the interests of the plebeians as a class. Whether the assembly of the tribes was composed of plebeians only, or of all, whether patrician or plebeian, living within certain limits, has not been ascertained; but the balance of opinion inclines to the hypothesis that it consisted of plebeians alone. After the rise of this new power, it became a matter of great difficulty to determine what questions were to be submitted to the tribes, and what to the centuries, each claiming to be the real representatives of the whole body of the people. A solution appears to have been sought and found in some combination of the two rival assemblies. At what time this change took place, and what was its exact nature, are matters which remain involved in the greatest obscurity. All that can be said is this: the plebeians, either by means of their own assembly, or by some use of it to counterbalance the power of the patricians in the assembly of the centuries, ultimately gained what they had so long aimed at—a position of supreme importance to the republic. When the wealthier classes found their influence thus neutralized, they ceased to attend the comitia altogether, and the popular will was represented by the lower classes alone. A period of moral and political corruption followed, ending in the military despotism of the Cæsars. Under the first emperors the form of calling the assemblies together was still observed, but the people met no longer to control their chief ruler, but simply to receive information as to what he had done. Even this form was by and by discontinued, and in the last days of the empire the comitia was an institution known only as one of the traditions of the past greatness of Rome. See ROME, *ante*.

COMITY OF NATIONS—more frequently mentioned by its Latin equivalent, *comitas gentium*— is that species of international legal courtesy by which the laws and institutions of one country are recognized and given effect to by those of another. "In the silence of any positive rule," says Mr. Justice Story, "affirming, or denying, or restraining the operation of foreign laws, courts of justice presume the tacit adoption of them by their own government, unless they are repugnant to its policy or prejudicial to its interests." From the existence of so great a number of independent states on the continent of Europe, and of federated states in America, the *comitas gentium* is more called into play in these countries than in our own, and it has consequently been more extensively discussed by their legal writers. See Story's *Conflict of Laws*. See INTERNATIONAL LAW.

COMMA, in the mathematical study of sound, is applied to two small intervals, which, by comparison and calculation, arise as the difference between the proportions of certain other intervals of the diatonic scale. The larger, but seldomer occurring C. is called the *C. ditonicum*, or the Pythagorean C., being the difference between the true octave, whose ratio is 2 : 1, and the interval which arises when the octave is obtained by tuning a progression of twelve perfect fifths, or arithmetically by adding their values together; by which process it is found that the last sound is greater than the true octave in the proportion of 531,441 to 524,288. The smaller C., *C. syntonum*, or C. of Didymus, is—First, The difference between the large whole tone, the ratio of which is 9 : 8, and the small whole tone 9 : 10, which is found in the compound of these ratios produced by multiplying together respectively their antecedents, 9 and 9, and their consequents, 8 and 10, to be 81 : 80. Second, The difference between the great limma, 27 : 25, and the great half-tone, 15 : 16, which is found by the same process, and then reducing the resulting ratio to its least terms, to be also 81 : 80. Third, The difference between the diesis, 128 : 125, and the diaschisma, 2,048 : 2,025, which by the same process gives 81 : 80; and lastly, the difference between the *small* limma, 135 : 128, and the small half-tone, 24 : 25, which again gives the proportions 81 : 80. The difference between the *C. ditonicum* and the *C. syntonum* is exactly the *schisma;* therefore, the aggregate of the diaschisma and schisma, if they be added together, is neither more nor less than the syntonic comma. This C., again added to the diaschisma, makes up the diesis, and added to the great half-tone, makes up the great limma. It follows therefore that, practically, two enharmonic tones in perfect tune never differ by a syntonic C., and it is wrong to say that *d* flat is higher than *c* sharp by a C., while the real difference is that of a diesis, 128 : 125. In the equal-tempered scale, these varieties do not exist. The term *syntonic* comes from the Greek, and means equal-sounding.

COMMANDANT', in military matters, is a temporary commander, in place of the real chief; such as a captain-commandant, lieutenant-commandant, etc. In foreign armies, the designation is more frequently applied than in the British, especially to the commanders of garrisons.

COMMANDER, in the British navy, is an officer next under a captain in rank, and serves either as second in command in a large ship, or in independent command of a vessel smaller than the sixth rate. In matters of etiquette, he ranks with a lieut. col. in the army. There were, in 1873, 155 commanders in commission, with pay of £1 per day; while there were 154 on half-pay, but eligible for re-employment, and 326 on retired half-pay; but the whole list of those employed, or eligible for employment, is to be reduced to 200. Half-pay ranges from 8*s.* 6*d.* a day to £400 a year. Retirement is optional at the age of 45; and compulsory at 50, or at any earlier age

after 5 years without employment. In 1876, there were 207 commanders in commission.

COMMANDER (*ante*), in the U. S. navy, an officer next in position below cap., equivalent to lieut.col. in the army.

COMMANDER-IN-CHIEF is the highest staff appointment in the British army. It is held by the gen. commanding all the forces in India, and would probably be given to the leader of any *large* army in the field, whether abroad or at home. Formerly, the army at home was administered by an officer of this rank; but since the death of the duke of Wellington in 1852, the military administration has vested in an officer holding no higher commission than that of "general on the staff;" who is called the gen. (or field-marshal, according to the holder's army rank) commanding in chief. Since 1855, this officer has been strictly subordinate to the secretary of state for war. The office of the C., technically known as the "horse guards," is a department of the war office, and comprises the sub-departments of the military secretary, the adj.gen., and the quarter-master-gen., with a staff of clerks. Under the "war office act" of 1870, and by orders in council of that year, the officer commanding in chief is one of the three great officers who administer the military affairs of the country under the secretary of state for war; his department being that of military command, discipline, and promotion. In practice, he makes all promotions and military appointments; though, in theory, these are all made on the responsibility of the secretary of state. Appointments to very important positions on the staff would not be made without the supervision of the minister and probable concurrence of the cabinet. The officer commanding in chief is responsible for all recruiting operations, and for the appropriation of troops to particular localities; but he exercises rather a general inspectional control than any immediate command over the men. The actual command vests in the general officers commanding the districts into which the kingdom is parcelled.

A *naval* commander-in-chief is the chief admiral at any port or station.

COMMANDER-IN-CHIEF (*ante*). In the United States, the president is the commander-in-chief of all the land and naval power of the nation. The immediate commander of the land forces is the "general of the army." In most of the states, the governor is commander-in-chief of the militia.

COMMANDERY, the title of the meeting or meeting-place of freemasons who have reached the degree of knights templar. Its origin was with the knights of Malta of the middle ages, and was first applied to sums saved from the revenues of the order for the support of war against the Moslems. It soon came to mean persons and places rather than things, and the "grand commander" became the next office to the grand master. Among the religious establishments suppressed in England by Henry VIII. were more than 50 commanderies of knights templars.

COMMANDITE, SOCIÉTÉ EN, or PARTNERSHIP IN, an expression used for at least two centuries in France, to express a partnership in which one may advance capital without taking charge of the business, or may become a "sleeping partner," as it is called in this country. The term owes its origin to the old meaning in the commercial nomenclature of France of the word command, which was applied to one person authorizing another to transact business for him. The working partner had a *commande* from him who merely advanced capital. The term has acquired importance of late in political economy, because the law of France could exempt the sleeping partners from responsibility beyond the amount they might agree to be responsible for. On the other hand, by the law of the United Kingdom, down to the passing of the limited liability act, every partner of a company was liable for all its debts. Hence, in the discussions about the question, whether it would be prudent to relax this law, and permit persons to invest money in trading companies without undergoing this responsibility, such companies were called "partnerships in commandite."

COMMANDMENTS OF THE CHURCH are certain rules laid down by Roman Catholic ecclesiastical authority which have almost the force of scripture commandments. The chief of them require the observance of Sundays and holy days of obligation, attendance at mass, rest from servile work on certain days, abstinence from flesh and but one meal on fast days, confession of sins at least once a year, the reception of the sacrament once a year, contributions to the support of pastors, and certain regulations concerning affinity and times in marriage.

COMMELYNA'CEÆ, a natural order of endogenous plants, consisting of herbaceous plants, with flat, narrow leaves, usually sheathing at the base. The calyx is 3-partite; the petals three, sometimes cohering at the base. The stamens are six, inserted under the ovary, which is 3-celled; the style is single. The fruit is a capsule, with 2 to 3 cells and 2 to 3 valves, bursting through the middle of the valves. The seeds are often in pairs, inserted by their whole side on the inner angle of the cell; the embryo lies in a cavity of the albumen. The order contains more than 260 known species, natives chiefly of warm climates; but a few occur in North America. None are European. *Tradescantia Virginica*, or SPIDER-WORT, common in our flower-gardens, is a familiar example of the order. *Commelyna cœlestis* is a fine ornament of our flower-gardens. The treatment is somewhat like that of the dahlia.

COMMEMORA'TION, or ENCÆ'NIA, the great festival of the Oxford academic year, usually takes place on the third Wednesday after Trinity Sunday. It is of very ancient date, public exercises and recitations having been held from time immemorial in honor of the act, or period when masters of arts and doctors complete their degrees, at first in St. Mary's church, but, subsequently to the erection of the Sheldonian theater (1669), in that building.

At present, the proceedings consist of a Latin oration in honor of founders and benefactors, delivered in alternate years (according to the bequest of lord Crewe, bishop of Durham) by the public orator and the professor of poetry; the presentation of the honorary degree of D.C.L. to strangers eminent in science, politics, etc., who are introduced to the chancellor, or, in his absence, to the vice-chancellor, by the public orator, in a short Latin speech; and the recitation of the Newdigate or English prize poem, the Latin prize poem, and the Latin and English prize essays, the three last named prizes being the gift of the chancellor. During the ceremonial, the northern extremity of the theater is occupied by the vice-chancellor, doctors, proctors, etc.; the area or pit by masters of arts and their friends; the lower seats in the semicircle by lady visitors; and the upper, or gallery, by bachelors and undergraduates, who claim on this occasion all the time-honored privileges of a gallery audience. Commemoration day itself is only the culminating point of a week of gayety, in which concerts, balls, theatrical representations, etc., replace the usual studies of the university, and in which heads of houses and tutors are only tolerated in so far as they give a sort of official sanction to the general festivity. In the theater itself, the more strictly academic and solemn portion of the proceedings receives but scanty respect from the majority of the audience. A momentary pause may perhaps be made when the "Newdigate" is being recited, or when some "lion" of unusual mark advances to receive his degree; but as a rule, the noisy humors of the gallery command much more attention than the stately periods of the public orator, or the timid recitations of the prize essayists. Of late, however, a feeling has sprung up among the senior members of the university (shared in, it is said, by several distinguished strangers) that the license of the gallery has exceeded all due limits; and in 1876 a change was made in the interior arrangements, the under-graduates not occupying a separate gallery, but being distributed among the ladies.

The vice-chancellor, who holds his office for four years, generally presides at C., but it is usual for the chancellor to do so once in the period of each vice-chancellorship. These occasions are called grand commemorations.

COMMEN'DAM. When a clerk is promoted to a bishopric, all his other preferments become void from the moment of consecration; but a method was devised by which the substantial interest in the living was retained by its being *commended* to the care of a bishop (called the commendatory) by the crown, till a proper pastor should be provided for it. Such a living was called an *ecclesia commendata*, and it was said to be held *in commendam*. The holding on this title might be really temporary for one, two, or three years, or it might be perpetual. By 6 and 7 Will. IV. c. 77, s. 18, it is provided that no ecclesiastical dignity, office, or benefice shall be held in C. by any bishop, unless he shall have held the same when the act passed.—Stephen, iii. 37.

COMMENDA'TORS, in Scotland, in Roman Catholic times, were stewards appointed to levy the fruits of a benefice during a vacancy. They were mere trustees; but gradually the pope assumed the power of appointing C. for life, without any obligation to account. "This was chiefly intended as a cloak for the plurality of benefices, and to evade the canon of the second council of Nice, by which one benefice only was allowed to be given to one and the same churchman; but all commendators were by our law prohibited, even during popery, by 1466, c. 3, except those that should be granted by bishops, for a term not exceeding six months."—*Erskine's Instit.*, vol. i. p. 98, Ivory's edit. See ABBOT.

COMMEN'SAL, a term denoting animals (not parasites) which attach themselves to other animals to share their prey. The term is equivalent to "table companion," and was applied to court-officers in France who had their meals at the king's table.

COMMEN'SURABLE. Two quantities or numbers are said to be commensurable which are of the same kind, and each of which contains a third quantity or number a certain number of times without remainder. See INCOMMENSURABLE MAGNITUDES.

COMMENTRY, a t. of France, in the dep. of Allier, 8 m. s.e. of Montluçon, on the Œuil. It stands in the center of one of the most important coal-fields of France, and within the last 30 years has risen from a mere village to be a busy and populous town. Pop. '76, 9,789, mostly engaged in the coal-mines and iron-works. A railway connects it with Montluçon and other places, and with the canal de Berry. In 1846, an immense fire consumed an enormous quantity of the coal in the mines.

COMMERCE. The term C. in its general acceptation means international traffic in goods, or what constitutes the foreign trade of all countries as distinguished from domestic trade. The first foreign merchants of whom we read, carrying goods and bags of silver from one region to another, were the Arabs, the reputed descendants of Ishmael and Esau. Their trade was by land. The first maritime carriers of goods were the Phenicians, who dwelt in a narrow strip of land on the e. shore of the Mediterra-

nean. They founded Tyre and Sidon, of whose opulence there are abundant proofs both in sacred and profane history. Launching their oared barks on the waves, and steering close along the shore so as to be able to take shelter in the nearest harbor on the approach of a storm, they established an easier and securer passage between Egypt and Syria than had before been known. The corn and wine of the Nile, and the oil, silk, dyes, and spices of western Asia, flowed through their hands. From carriers they became merchants, and to merchandise they added manufactures. In the days of Solomon their vessels penetrated the Red sea, and brought to that king the wealth of Ophir. They traversed the shores of the Mediterranean, established colonies in the Greek islands, and founded Carthage, one of the most noted commercial cities of the ancient world. The Phenicians flourished greatly until the capture of Tyre by Alexander, 332 B.C. Then the inhabitants who survived a long siege were killed or sold into slavery, and the very name Phenician disappears from history, absorbed, doubtless, in the rising glory of the cities of Greece—Athens, Corinth, Argo, and their colonies; of Carthage, then in full fame; and of Alexandria, the great seaport founded by the conqueror.

While Rome was giving laws and order to the half-civilized tribes of Italy, Carthage, operating on a different base and by other methods, was opening trade with less accessible parts of Europe. The strength of Rome was in her legions, but that of Carthage in her ships; and her ships could reach realms where legions were powerless. Her mariners had passed the mysterious strait into the Atlantic and established the port of Cadiz. They founded Carthagena and Barcelona, and had depots and traders on the shores of Gaul. This prosperity of their C. led to wars with martial Rome, and, 146 B.C., the great city of Carthage, more than 20 m. in circumference, and containing a million of inhabitants, was utterly destroyed. In the same year the Romans captured and burnt Corinth, which was then an important commercial city; and 60 years later, Athens met a similar fate. These disasters almost annihilated sea commerce. Land C. also suffered a disastrous blow soon after the fall of Athens, in the capture by the Romans of the important city of Palmyra, when the walls were razed, the people killed or dispersed, and the famous queen Zenobia taken to Rome a prisoner.

The repeated invasions of Italy by the Goths and Huns gave rise to the founding, for defense and for trade, of the city of Venice, about the middle of the 5th c.; a city that for more than a thousand years stood foremost in the trade of the world. The Venetians traded with Constantinople, Greece, Syria, Egypt, India, and Arabia. They became rulers in the Morea, in Candia, and in Cyprus. It was in Venice that the first public bank was organized; that bills of exchange were first negotiated, and funded debt became transferable; that finance became a science, and book-keeping an art. We cannot trace the steps of C. during the middle ages; nor is it important; in fact, international trade to any considerable extent was unknown. But the 15th c. showed a wonderful expansion of discovery, and consequently of trade. The mariner's compass made distant voyages possible on the open sea. In 1418, the Canary islands were colonized by the Portuguese; in 1431, the Azores were discovered; in 1486, the Guinea coast of Africa was made known; and in 1497, Vasco da Gama passed round the cape of Good Hope to Zanzibar. Before the end of the century, Columbus had thrice crossed the Atlantic, touched at San Salvador, discovered Jamaica, Porto Rico, and the isthmus of Darien, and had seen the waters of the Orinoco in South America. Meanwhile, Cabot, sent out by England, had discovered Newfoundland, Labrador, Nova Scotia, and Virginia. Nearly all this daring enterprise had for its prime object the finding of some easy route to the fabulously wealthy east, to India and China. But a century elapsed before the English fixed their first establishment or factory in India. The discovery of the new world, however, while so diligently searching for a sea route to the old one, was destined to change the course and the nature of trade. The Spaniards overran South and Central America, eager above all things for conquest and for gold; the French opened Canada and the great Mississippi; in 1621, the Dutch were fairly established in what is now the foremost commercial city of the two continents, and second to but one in the world in trade and importance—New York. About the same time the English colonized Virginia and New England.

From such rapidly spreading exploration and colonization there necessarily arose new wants, new products, new manufactures, and rapidly increasing trade; interrupted more or less by wars, but in the main marching steadily and rapidly on. The present century has witnessed an extension of the commercial relations of mankind to which there is no parallel in history. In 1819, the first steam-vessel crossed the Atlantic ocean, from Charleston, S. C., to Liverpool, and a similar adventure from England to India was accomplished in 1825. The application of steam to transportation and manufacturing immensely enlarged the capacity and needs of commerce. Another astonishing impulse to trade came with the discovery of gold in California and Australia. The two events were almost coincident, and came when a general extension of trade had already been ten years in progress. The first effect was to produce a great emigration to the regions in which the gold-fields were situated, and this was followed by large exports of goods to the same quarters, which, as usually happens when business falls out of the ordinary mercantile course, was much overdone, and ended in heavy loss to many shippers. Abundance of labor had been supplied with unwonted celerity to the gold-fields, and as the labor was not unremunerative, and in many cases was rewarded by large findings of gold, the commotion in emigration, shipping, and traffic was sustained for a

number of years. The coffers of the great banks were filled with new supplies of gold, and this imparted confidence to banking operations by which the money was soon distributed. All this was calculated to give additional impulse and extension to the commercial forces already in motion; there was an increased demand for goods; much labor had been transferred from old seats of industry to new fields, and there was rise of wages as well as of prices. The California and Australia mines remain productive, though in a reduced degree, and their most permanent effect on C. will be found in the fact that they helped to build California into a populous and prosperous state, and to make the Australian colonies a growing empire.

Great as has been the effect of these gold discoveries upon C., they sink into comparative insignificance before an influence already alluded to, and that is steam. There is little use to descant upon steamships and railways, and the later important agency of the telegraph, all equally marvelous in their power of facilitating C., and in the rapidity of their construction to this end. In 1839, the ocean steamers of the world might have been counted on the fingers of one hand. To-day, all the great maritime states have lines and fleets of sea-going steamers, enormous for bulk and power, threading the great rivers, cleaving every sea, and gulf, and strait, and going and coming from every considerable port on the earth. Great Britain alone has more than 1600 such steamships employed wholly in foreign trade. No one knew until 1825 that goods and persons could be hauled over the land by steam. In this year, 1880, there are in the United States alone, 85,000 m. of railroads in operation, built at a cost of $4,762,000,000. The rapid development of the telegraph is more wonderful in an age of wonders than that of steam. It was in May, 1844, that the first line of magnetic telegraph (Morse's) was used in this country, between Washington and Baltimore, about 40 miles. There are now almost 100,000 m. of line and over 220,000 m. of wire in the United States alone, not including railroad telegraphs. Continents and nations are linked by submarine cables, and it is actually easier to-day for a merchant to send an order to and receive an answer from Calcutta than it was 40 years ago to achieve the same feat between New York and Brooklyn. Still another modern improvement—made possible by the telegraph—has a beneficial effect upon C.; and that is the weather service established in the United States, Great Britain, and some other European countries. There can be no doubt that C. by sea has been rendered much more secure by the knowledge of the state of the weather at a distance, and the probabilities of what it is likely to be in any given place, now published in all centers of trade.

By these inventions and in the natural course of progress, C. has acquired a security and extension in all its essential conditions, of which it was void in any previous age. It can never again exhibit the wandering course from route to route, and from one solitary center to another, which is so characteristic of its ancient history, because it is established in every quarter of the globe, and all the seas and ways are open to it on terms fair and equal to every nation. Wherever there are population, industry, resource, art, and skill, there will be international trade. C. will have many centers, and one may relatively rise or fall; but such decay and ruin as have smitten many once proud seats of wealth into dust, cannot again occur without such catastrophes of war, violence, and disorder, as the growing civilization and reason of mankind, and the power of law, right, and common interest forbid us to anticipate. [Portions of this article are, with modifications, from *Encyclopædia Britannica*, 9th edition.]

COMMERCIAL LAW. See MERCANTILE LAW.

COMMINATION is from the Lat. *comminor*, to threaten, and is the name given to a penitential service used in the primitive church. In the earliest ages, those who were guilty of grievous and notorious sins were put out of the church, until, on their repentance, and after long trial, they were restored to full communion. It seems that, at least from the beginning of the 8th c., there was an office of this kind for public penitents on the first day of Lent; but from various causes the penitential discipline became extinct, both in the eastern and western churches, and the office for Ash Wednesday (so called from the penitents coming clad in sackcloth and ashes) is the only memorial of it left. The office, as used in the church of England, is nearly the same as those found in the Salisbury and York missals. The curses contained in Deut. xxvii. against impenitent sinners are read, and the congregation answer "Amen" to every sentence, as acknowledging the justice of the sentences. See Bingham's *Antiquities*.

COMMISSARIAT is a name for the organized system whereby armies are provided with food, and daily necessaries other than those connected with actual warfare. Among the ancients the Romans attended best to the C.; the *quæstors* were the commissaries. In feudal times, the soldiers were mainly dependent for food on their lords; but they lived very much by plunder. During the wars of the crusades, the C. was so utterly neglected, that thousands died of starvation.

In England, the first germ of the modern C. appeared in the office of *proviant-master*, in the time of queen Elizabeth. Under Charles I., commissaries were stationed in the different counties. Under Marlborough's command, the troops were supplied by contract; he received a percentage, and peculation was very common. After many changes during the 18th c., a commissary-general was appointed in 1793, to superintend all contracts for food and forage. The dire experience of the Crimean war showed how greatly

reform was required in this important department. In 1858 and 1859, accordingly, it was newly organized; and remained, until 1870, a war-office department, under a commissary-general-in-chief.

In 1870, the C. was merged with other supply departments in the great "control department," which, under the surveyor-general of the ordnance, performed all the civil administrative duties of the army. In Dec., 1875, the control department fell from its high estate, and the "C. and transport department" arose from its ashes. Its duties are the provision of food, fuel, lodging, and transport: a function on which it is needless to say the very existence of the army depends. The department is administered by the director of supplies, at the war office, who is an officer on the staff of the surveyor-general. The ranks of C. officers are commissary-general (ranking as brig.gen.), deputy-commissary-general (as col.), assistant commissary-general (as lieut.col.), commissary (as maj.), deputy-commissary (as capt.), assistant-commissary (as lieut.), and sub-assistant-commissary.

COMMISSA'RIAT (*ante*). In the U. S. army, the C. is in charge of the "commissary of subsistence," an officer with the rank of brig.gen.

COM'MISSARY, in general, is any one to whom the power and authority of another is committed. In this sense it is nearly equivalent to commissioner. In ecclesiastical law, a C. is an officer appointed by a bishop to exercise jurisdiction in parts of the diocese which are so distant from the episcopal city that the people cannot be conveniently summoned to attend the principal court.

When the papal authority, and all jurisdiction which flowed from it, was abolished in Scotland, by the acts 1560 and 1567, a supreme C. court was established in Edinburgh, by a grant of queen Mary, dated Feb. 8, 1565. This court had jurisdiction in actions of divorce, declarators of marriage, nullity of marriage, and all actions which originally belonged to the bishop's ecclesiastical courts. Its powers were gradually conjoined with those of the court of session, and it was finally abolished in 1836 (6 and 7 Will. IV. c. 41), the small remains of its once important jurisdiction being united in the sheriff of Edinburgh. The inferior commissariats, which had usually been commensurate with the dioceses, were dealt with by a previous statute (4 Geo. IV. c. 97), each county being erected into a separate commissariat, of which the sheriff was commissary. The jurisdiction of these courts so conjoined with that of sheriffs was, in 1876, finally transferred to the sheriffs absolutely, and the separation between the two sets of officers ended, except in the case of the C. clerk of Edinburgh. See Alexander on *Practice of the Commissary Courts in Scotland*, 1858, which gives a very interesting sketch of the history, constitution, and jurisdiction of these courts.

COMMISSION, a writing, in the form of a warrant or letter-patent (see PATENT), authorizing one or more persons to perform duties or exercise powers belonging to another, or to others. Instruments of delegation, bearing this title, are issued by the crown to officers in the army and navy, judges, justices of the peace, and others.

Another class of commissions are those granted sometimes by the crown, and sometimes by parliament, to a body of persons, either to inquire into the condition of certain institutions or branches of the public service, or to exercise certain powers, or execute certain measures for their improvement. Persons holding such commissions, deriving no other title from their appointment, are called commissioners; e.g., the English ecclesiastical commissioners, the commissioners for the relief of the poor, the commissioners for the affairs of India, the emigration commissioners, etc.

COMMISSIONAIRES are a class of attendants at continental hotels, who perform certain miscellaneous services. Employed to attend at the arrival of railway-trains and steamboats to secure customers, they wait to take charge of luggage, see it passed through the hands of the custom-house officers, and send it on to the hotel; for all which service they charge a fee. They likewise procure visés to passports, and act as valet-de-place. In this last capacity, they may be hired for the day to conduct strangers to public places of interest, galleries of art, or other sights. In Paris, they are generally respectable and intelligent, and speak English with tolerable fluency. In the French outports, such as Boulogne, they can be referred to less favorably.—Lately, a body of C. has been established in London, and also in Edinburgh, consisting of maimed soldiers who have retired with a pension, and are of unexceptionable character. On a moderate tariff of charges, they act as messengers, light-porters, valet-de-place, and make themselves otherwise useful.

COMMISSIONER, in Scotch bankruptcy. This office has little or no resemblance to that of the judge in England bearing once such a title. In Scotland, three commissioners are appointed by the creditors to advise, and in certain cases to superintend the trustee, who is the party charged with the realization and distribution of the estate. The commissioners audit the trustee's accounts, they fix his remuneration, and they have to ascertain that the moneys collected by him have been duly lodged in bank. They themselves are not entitled to remuneration; and they cannot purchase any portion of the estate. Their qualification is to be creditors, or mandatories of creditors; but any disqualification for the office of trustee also unfits for this office.

COMMISSION OF ASSEMBLY. See GENERAL ASSEMBLY.

COMMISSION DEL CRE'DERÉ. See DEL CREDERE COMMISSION.

COMMISSION MERCHANT, or AGENT, called also a broker, or factor, is a person employed to sell goods consigned or delivered to him by another who is called his principal, for a certain percentage, commonly called his commission or factorage. As the goods thus received are said to be consigned, the C. M. or agent is often called a consignee.

COMMISSIONS, ARMY, are warrants for serving the crown in certain military offices. Those holding such authority are called *commissioned officers*. Non-commissioned officers form a step intermediate between commissioned officers and private soldiers. First commissions in the probationary rank of sub-lieut. are granted by competitive examination open to every British subject of proper age and character. Subsequent—i.e., higher—commissions are given up to the rank of lieut.col., by "selection tempered by seniority." The commission of col. is attained by service only, and commissions as maj.gen., lieut.gen., and gen., follow by pure seniority. These remarks apply to cavalry and infantry only: commissions in the artillery and engineers are obtained—first, by passing a severe course of study at Woolwich academy, admission to which is by open competition; later commissions by seniority entirely. Before Nov. 1, 1871, commissions in the cavalry and infantry were partly obtained by purchase, under the system, now abolished, called the PURCHASE-SYSTEM. The prices of commissions rose gradually from the time of Charles II. until the Russian war of 1853, when the *regulation prices* were as follows:

Rank.	Regulation Price of Commissions.	Diff. in value between the several Com. in succession.
LIFE GUARDS.		
Lieutenant-colonel	£7250	
Major	5350	£1900
Captain	3500	1850
Lieutenant	1785	1715
Cornet	1260	525
DRAGOON GUARDS AND DRAGOONS.		
Lieutenant-colonel	£6175	
Major	4575	£1600
Captain	3225	1350
Lieutenant	1190	2035
Cornet	840	350
(The prices of cavalry commissions were reduced in 1861 to infantry rates.)		
FOOT GUARDS.		
Lieutenant-colonel	£9000	
Major, with rank of Colonel	8300	£700
Captain, " Lieutenant-colonel	4800	3500
Lieutenant, " Captain	2050	2750
Ensign, " Lieutenant	1200	850
(In 1857, purchase was limited to the lower three ranks.)		
LINE REGIMENTS.		
Lieutenant-colonel	£4500	
Major	3200	£1300
Captain	1800	1400
Lieutenant	700	1100
Ensign	450	250

The conditions of promotion, and the operation of the purchase-system, will be considered under PROMOTION and PURCHASE-SYSTEM. In the navy also, the chief officers hold their authority by commission. See OFFICERS; PROMOTION.

COMMITMENT. See IMPRISONMENT.

COMMITTEE (Fr. *comité*), a portion, generally consisting of not less than three members, selected from a more numerous body, to whom some special act to be performed, or investigation to be made, is *committed*. But though a C. usually consists of several members of the body by which it is appointed, it may consist of one member, or, what is more frequent, of the whole members acting in a different capacity from that which usually belongs to them. This latter form of C. is known in parliament as a C. of the whole house. In order to mark the distinction between the house itself and the same body when thus resolved into C., the speaker in the commons, and the chancellor in the lords, as soon as the C. is formed, leave the chair, which is occupied by the chairman of C., a paid official, who is appointed at the commencement of every parliament. In the commons, moreover, the mace, which usually lies on the table, is put under it when the house goes into committee. Of committees of the whole house, the most familiar

examples are committees of supply (q.v.) and of ways and means (q.v.). The vote of a C. is of no force till it has been reported to and received by the house. In the case of every public bill, moreover, a C. of the whole house is constituted after the second, and before the third reading, in order that the details of the measure may be more carefully adjusted. In private bills, analogous functions are performed by select committees. Occasional matters requiring special investigation are also remitted to select committees. These, for the most part, conduct their investigations in public; but there are instances also in which the public safety seems to require secrecy, in which they deliberate with closed doors, and they are then called *secret committees*.

COMMITTEE (*ante*). In the U. S. congress and in state legislative bodies, the forming and management of committees are almost the same as in the English parliament, except that in committee of the whole house any man may preside (except the speaker), while in the house of commons there is a regularly chosen chairman of all committees of the whole house.

COMMODORE, in the navy, is a rank intermediate between an admiral and a capt. It is not permanent, but is bestowed for a time on a capt. Usually, a C. commands more ships than one, detached from a fleet on some special service; he hoists at that time a pendant. If a C. of the first class, his pendant is broad and red, pointed at the outer end; if of the second class, blue. A C. is privileged to have a commander under him in his ship, in the same way as an admiral is privileged to have a capt. The C., in matters of etiquette, ranks on a level with a brig.gen. in the army. The pay of a C. is £1095 per annum, when in command, in addition to table money of the same amount.

COMMODORE (*ante*), in the U. S. navy first recognized by law in 1862, but long before used by the people as an honorary title. The rank is above capt. and below rear-admiral.

COM'MODUS, LUCIUS AURELIUS, a Roman emperor, b. 161 A.D., was the son of Marcus Aurelius Antoninus. Great pains were taken with his education. But the solicitude of his father was all to no purpose. C. only waited for an opportunity to exhibit as startling and detestable a mixture of sensuality, cruelty, and meanness as had ever been witnessed in Rome. When he was summoned to the throne on his father's decease, 17th Mar., 108, he manifested a shameful eagerness to plunge into the dissipations of Rome. At that period he was successfully fighting the Marcomanni and other tribes on the upper Danube, and, not to be balked of his anticipated pleasures, he hastily concluded a treaty with the barbarians, and reached the capital in the beginning of the autumn. The cruelty to which he was always prone, was especially called into action after a conspiracy by his sister Lucilla against his life had been discovered in the year 183. Nearly all who, by virtue, ability, and learning, had risen to honor during his father's life-time, were sacrificed to appease his savage jealousy of the good and the great. Gross prodigality in the expenditure of the resources of the state on the amusements of the amphitheater also marked his reign. He was proud of his own physical strength, and exhibited it in gladiatorial combats. For each of these exhibitions, he charged the state an enormous sum. He used also to sing, dance, play, act the buffoon, the peddler, or the horse-dealer, and engage in all the filthy and horrible orgies of Egyptian sacrifice. A glutton, a debauchee, who wallowed in the most sensual abominations, he yet demanded to be worshiped as a god, and assumed the title of Hercules Romanus. Many plots were devised against the life of this mingled monster and madman, and at last one of them accomplished its purpose. His mistress, Marcia, in concert with the prefect Laetus and the imperial chamberlain Eclectus, after they had failed in an attempt to poison him, caused him to be strangled by Narcissus, a famous athlete, on the 31st of Dec., 192.

COMMON, in law. This is one of the numerous instances in which a different meaning is attached to the same term in the legal systems of England and Scotland. In England, a C., as defined by Blackstone, is "a profit which a man hath *in the land of another*, as to feed his beasts, to catch fish, to dig turf, to cut wood, or the like." In Scotland, again, where the law has adopted the divisions and followed the nomenclature of the civil law and of the legal systems of continental Europe, all these profits, or rights to derive profit, are known as *servitudes* (q.v.), whereas a C., or commonty, as it is more frequently called, is a common right of property existing in several individuals, frequently the inhabitants of a whole village, in a piece of ground. In each individual, the right of course is limited, so as in reality to amount to little more than a servitude; but there is no over-lord, the land is not the land of another, but the land of the community as a body.

The division of C. lands, or those over which C. is claimed, among the parties possessed of such rights, or the permission to the owner to inclose the lands on making compensation to the owners of C. rights, has been the subject of regulation by a very great number of statutes. Many of these are private acts, but the 6 and 7 Will. IV. c. 115, laid down general rules for effecting the purpose in future, without the necessity of obtaining an act of parliament, where the consent of two thirds of the parties interested could be obtained, and the C. to be inclosed lay more than 10 m. from London, and a specified distance from any other large town. By a subsequent statute (8 and 9

Vict. c. 118, amended by several later acts), a board of commissioners (see ENCLOSURE COMMISSIONERS) is appointed to inquire into the propriety of any proposed inclosure or partition, and to report to parliament, which then may pass a public act authorizing the proceedings. This is the course generally adopted.

In Scotland, *commonties* or commons were made divisible by an action in the court of session, at the instance of any having interest, by the stat. 1695, c. 38.

On the subject of inclosing commons, Mr. J. S. Mill (*Dissertations and Discussions*, vol. ii. p. 213) expresses the following decided opinion: "We must needs think, also, that there is something out of joint, when so much is said of the value of refining and humanizing tastes to the laboring-people—when it is proposed to plant parks and lay out gardens for them, that they may enjoy more freely nature's gift alike to rich and poor, of sun, sky, and vegetation; and along with this a counter-progress is constantly going on of stopping up paths and inclosing commons. Is not this another case of giving with one hand and taking back more largely with the other? We look with the utmost jealousy upon any further inclosure of commons. In the greater part of this island, exclusive of the mountain and moor districts, there certainly is not more land remaining in a state of natural wildness than is desirable. Those who would make England resemble many parts of the continent, where every foot of soil is hemmed in by fences and covered over with the traces of human labor, should remember that where this is done, it is done for the use and benefit, not of the rich, but of the poor; and that in the countries where there remain no commons, the rich have no parks. The common is the peasant's park. Every argument for plowing it up to raise more produce, applies *à fortiori* to the park, which is generally far more fertile. The effect of either, when done in the manner proposed, is only to make the poor more numerous, not better off. But what ought to be said when, as so often happens, the common is taken from the poor, that the whole or great part of it may be added to the inclosed pleasure-domain of the rich? Is the miserable compensation, and though miserable not always granted, of a small scrap of the land to each of the cottagers who had a goose on the common, any equivalent to the poor generally, to the lovers of nature, or to future generations, for this legalized spoliation?"

COMMON, TENANCY IN. This is an estate (q.v.) or a right in property accruing to two or more persons; and the nature of it is, that each has a distinct right to his own share, although no division has yet been made. But the common owners may agree to a partition, or one of them may, in equity, compel a partition. If the estate is one which passes by inheritance, the heir of each owner takes his share, and there is no benefit of survivorship. A tenancy in C. may be created either by a conveyance in express words, or by the parties obtaining their titles at different times, or at the same time from different parties. But if the title accrues by descent from the same ancestor, even though at different times, it is a tenancy in coparcenary (q.v.).

COMMON BENCH. See BENCH and COMMON LAW, COURTS OF.

COMMON CHORD. See CHORD.

COMMON COUNCIL, ordinarily means, in American cities, the local legislative body, consisting of the boards of aldermen and assistant aldermen, or councilmen, or selectmen. In Boston, and a few other cities, the aldermen form a different board from the common council.

COMMON COUNTS. Short formal statements of the cause of action made in a declaration (q.v.).

COMMON DEBTOR. See DEBTOR and CREDITOR.

COMMONER, in England applied to all citizens except the hereditary nobility. John Hampden was called the "great commoner," and the title was also given to the elder Pitt before he became a member of parliament. In Oxford, students of the second rank who pay board are called commoners.

COMMON FORMS are the ordinary clauses used in writs and deeds in England. It has been attempted to substitute, for some of these, short expressions conveying all the meaning of the C. F.; but the statutes by which the attempt was made (8 and 9 Vict. c. 119 and c. 124), being permissive merely, have as yet not affected practice. A main reason for the preservation of C. F. was the general rule that conveyances were paid not according to value, or the difficulty of their task, but according to the length of a deed. A statute of the session (23 and 24 Vict. c. 145) made a further effort to abolish the C. F. used in appointing trustees, etc., by giving to them the powers which were formerly contained in the common forms. Brevity, however, gains ground.

COMMON GOOD. See CORPORATION.

COMMON HOUSE, or COMMON ROOM, was an apartment in a monastery in which a fire was constantly kept burning for the use of the monks, who frequently were allowed no fire anywhere else. The C. H. was presided over by a monk, who was called the master. It was the prototype of the common rooms in the colleges and halls of the English universities.

COMMON LAW, in England. These words, in their proper sense, signify the ancient consuetudinary law of England. The C. L. is therefore distinguished from the statute

law and from equity. It is wholly overruled by the statute law. On the 2d Nov., 1875, the C. L. courts were merged in the supreme court of judicature by the act of 1873 (see COURTS OF COMMON LAW), with a view to incorporate equity also, when the two systems conflicted. Accordingly, the old relation between law and equity subsists, and the former maintains its force in spite of any discordant rules of equity, which can therefore now take effect through the intervention of a court by which the C. L. is in each particular case corrected or superseded. For an enunciation of cases in which this result is shown, the reader is referred to the article under the heading EQUITY.

The C. L. is, in one sense, an unwritten law. Its rules have been handed down by tradition, sometimes in a complete and definite shape, such as the law of primogeniture, the jurisdiction of the courts, etc.; sometimes as a mere spirit or tendency, according to which, in novel cases, as they may arise, the law is to be expounded. Thus, the law-merchant is chiefly part of the C. L., although only some of its rules are of real antiquity, and the greater portion of them were developed no later than the last century. Therefore, in such cases, the C. L., though accounted traditional, is expanded by the judges who declare it, who enounce new rules suited to new combinations of circumstances, and merely bearing an analogy to what the ancient C. L. had established in cases which fell within its purview. It is therefore not wonderful that there should frequently be dispute as to what the C. L. is, and that different courts should occasionally give different decisions upon such questions.

As the C. L. has never been formally enacted, nor has yet been reduced to a regular code, it is to be sought for in the treatises of institutional writers, and in the decisions of the courts of law. These last are of the highest authority, and where they are consistent, they are taken as irrevocably establishing the law. But being declaratory merely, and not imperative, a single judgment of a court is not held conclusive upon courts of equal jurisdiction, though it is commonly accepted as binding by inferior courts. A court may even depart from its own decision, if it shall come to be of opinion that the law has before been incorrectly stated. But this principle perhaps undergoes an exception in the house of lords, which being the highest court of all, it is laid down by some of the law peers that its judgments have the force of statute, and that the rules it has once sanctioned can be altered only by statute. The point has long been regarded as settled; and it is almost the only correct theory on which a court of supreme jurisdiction, like the house of lords, can continue to exercise its functions.

The C. L. is applicable to the whole realm, but it is part of its principles that in particular circumstances it may recognize rules which are not of universal application; thus, in certain courts, it adopts as its own the provisions of codes which it entirely rejects in other courts. The civil and canon law are in some of their rules recognized as part of the C. L. in the maritime and ecclesiastical courts (including under the latter denomination the new courts of probate and divorce), but they are of no authority otherwise in the courts by which the main branches of the C. L. are administered. So also, in particular localities, customs exist which the C. L. sanctions, although they may be at variance with its general provisions. Such are the rules regarding succession which prevail in Kent under the name of gavelkind (q.v.), and in certain towns under the name of borough English (q.v.). But customs of much more circumscribed operations are, when proved, equally accepted by the C. L. as part of itself within the limits in which it prevails; for the C. L. deems it not inconsistent to adopt a contrary rule to its own, if clear and uniform and confined to one locality. In order to entitle a custom to the force of law, it must be of such endurance "whereof the memory of man runneth not to the contrary." The period thus indicated is more precisely defined as extending to the commencement of the reign of Richard I. By this is meant, however, not that the custom must be proved to have been in perpetual vigor since that remote epoch, but that proof of its non-existence within that period will invalidate it. If no such proof is adduced, the custom will be established by the evidence of experienced living witnesses, or by such documentary evidence as is inconsistent with any other assumption.

COMMON LAW, COURTS OF. These are generally divided into superior and inferior. The superior sit at Westminster, and hence are often called the courts at Westminster. They had the names of the court of queen's bench, the court of common pleas or of common bench, and the court of exchequer. These are all offshoots of the great court, the *aula regia* of the early Norman kings, which, under the presidency of the chief-justiciar, and composed of the great officers of state and of the household, of the principal nobility, and of the justices learned in the law, attended the king's person wherever he went, and formed the sole superior court of the kingdom. But the inconvenience attending so transitory a judicature led to the demand, conceded in Magna Charta, c. 12, that *communia placita*, common pleas, should be held in a fixed place, and hence arose the establishment of the court of that name. Afterwards, under Edward I., the office of chief-justiciar was abolished, and the judicial functions of the aula regia partitioned among the court of chancery and the three courts of C. L. above named. In 1873, the judicature act, 36 and 37 Vict. c. 66, was passed, which rearranged all the superior courts in England, consolidating them into one supreme court of judicature,

but having five divisions called the high court of justice. Three of these divisions were called the queen's bench division, the common pleas division, and the exchequer division, respectively. The kind of business dealt with in each division was substantially the same as under the previous arrangements, the chief difference being the new names of the courts and the principle now common to them all, that thereafter they should administer justice without distinction as to its being theretofore known as common law or equity. The former distinctions existing in the jurisdiction of the courts may still be briefly indicated under the head of each court.

1. *Court of Queen's Bench.*—This court was composed of a chief-justice, who was entitled to the style of chief-justice of England, and five puisne judges or justices. Its peculiar powers lay chiefly in the exercise of supervision over the proceedings of inferior courts and magistrates, to the effect of restraining them from exceeding their jurisdiction, or of compelling them to perform their duty, and in the control of corporations in the event of illegal procedure, and in criminal jurisdiction.

2. *Common Pleas.*—This court retained exclusive jurisdiction over real actions so long as they existed, but as they have long been abolished in favor of simpler forms which are equally available in the other courts, it held few peculiar powers. A remnant of its original authority was reserved to it in the disposal of the actions which came in lieu of the old writs of dower to this court (23 and 24 Vict. c. 126, s. 26), and in the rule that certain deeds affecting land must be registered in the court of common pleas. This court was also by statute the court of appeal from the decisions of the revising barristers (q.v.). It was presided over by a chief-justice, styled "of the common pleas," and there were also five puisne justices.

3. *Exchequer.*—This court possessed exclusive authority in all matters relating to the revenue. It was at one time a court of equity, as well as of common law, but the equity branch (which was always distinct) was abolished by 5 Vict. c. 5. It was composed of a chief-baron and 5 puisne barons.

The chiefs of these courts are appointed by the crown; the puisne judges by the lord chancellor. The salary of the chief-justice of queen's bench is £8,000; that of the chief-justice of common pleas, and the chief-baron of exchequer, £7,000; and that of the puisne judges, £5,000 per annum.

The queen's bench used to sit also as a bail court (q.v.). The appeal formerly from these courts was to the exchequer chamber and thence to the house of lords. But now the appeal is to her majesty's court of appeal in the first instance, and thence to the house of lords. This last court of appeal consists of the lord chancellor and the lords of appeal appointed to sit as peers; and it may besides include those peers who hold or have held high judicial offices in England, Scotland, or Ireland.

The sittings of the above superior courts are held only during term (q.v.), when they are said to sit *in banc* (q.v.), and decide on all questions of law that may arise in the actions brought before them. But questions of fact, unless both parties consent to leave them to the decision of the court (17 and 18 Vict. c. 125, s. 1), are decided by a jury, and the courts in which they are tried are held out of term time, before one or two judges only, not necessarily of the court to which the action belongs. These trials take place either on circuit (q. v.), or at the London and Westminster sittings, which are in or after every term, and in either case are called trials at *nisi prius*. The verdict is returned to the court to which the action belongs, by which it is disposed of according to law.

The authority of the superior courts of C. L. extends over the whole of England, and over common law rights of every description. But since the remodelling of the county courts, it has been enacted by several statutes, with a view to discourage resort to such high judicatures in trifling cases, that in some species of actions in which less than £20, and in other species in which less than £5 shall be recovered, in the superior courts, no costs shall be allowed the plaintiff, unless the judge who tries the case shall certify that there was sufficient reason for its being brought in the superior courts.

The inferior courts are restricted both in respect of place and matter. They were extremely numerous, but now nearly all have been formally abolished; but they are now, with few exceptions—the principal of which is the modern county court (q.v.)—matter of interest to the antiquary rather than either to the practical lawyer or the public. They may therefore be passed over with very brief explanation.

The *court baron* was a court composed of the tenants of each lord of a manor. It might decide on all real actions (now abolished) arising within the manor, and on personal actions below the value of 40*s*., but subject to review by the court at Westminster. In a manor comprising copyholds (q.v.), it is still of importance. The *hundred court* was a similar court, composed of the freeholders within the hundred (q.v.), and had like powers with the court baron. The court of *pie poudre*, or dusty foot, was held by the steward of a manor to which a market belongs, for the decision of all questions of bargaining at the markets. The *forest courts*, of several classes, were for the preservation of the beasts of the chase, and the protection of the subject from oppression by the officers of the forest. The *courts of request* in boroughs were for the recovery of small debts, but are now abolished.

A few *borough courts* still exist, and are held under the presidency of the recorder (q.v.). From them a writ of error lies to the superior courts. The *lord mayor's court*, and the *city court*, in the city of London, have a considerable amount of business. The

court of hustings in London is practically obsolete. The *court of the cinque ports* is held before the mayor and jurats of each port, from which error lies to the lord warden of the cinque ports court at Shepway, and thence to the queen's bench. The *stannary courts* in Cornwall and Devonshire are also still in use, and exclude, as to the tin-workers, the jurisdiction of all other courts, except in pleas of land, life, or member. They are held before the vice-warden of the stannaries, and appeal lies only to the warden, assisted by two of the judges; and thence to the high court (2 and 3 Vict. c. 58, 18 and 19 Vict. c. 32, and 32 and 33 Vict. c. 19). There are in some counties also *barmote courts*, for regulating questions relating to the mines (14 and 15 Vict. c. 94). The courts of the chancellors of the universities of Oxford and Cambridge have also exclusive jurisdiction (except as regards freeholds), where the defendant is resident in the town, and a scholar or privileged member of the university is a party.

The court of common pleas in Lancaster, and the court of pleas in Durham, have jurisdiction in all personal actions, and now form part of the high court of justice.

COMMON LAW (*ante*), in the United States is in all essentials the same as the common law of England, from which it differs only in the forms of administration. It covers those principles, usages, and rules of action applicable to the government and security of property and of person, which do not rest their authority upon any positive statute or enactment.

COMMON LAW BAR, that portion of the English bar which devotes itself to practice in the common-law courts, distinguished from the equity bar, which practices only in the courts of chancery.

COMMON LODGING-HOUSES. See LODGINGS.

COMMON PLEAS. See COMMON LAW, COURTS OF.

COMMON PRAYER-BOOK. This contains the forms of public worship and administration of the sacraments and other rites and ceremonies according to the use of the United Church of England and Ireland. It is, for the most part, a translation of such portions of the services of the ancient Catholic church as were considered by the reformers free from all objection. Before the reformation, the liturgy was in Latin, and the form generally adopted in the s. of England was that after the use of Sarum. The first steps towards its reformation were taken by Henry VIII., the main objects in view being the abolition of what was superstitious, and the translation of the services into the vulgar tongue. In the year 1540, a committee of bishops and divines was appointed for the purpose, and what was done by them was revised by convocation in 1543. In the year 1545, the *King's Primer* came forth, containing, amongst other things, the Lord's prayer, creed, ten commandments, "Venite," "Te Deum," litany, and other hymns and collects in English, several of which were in the same version as at present used. It was, however, in the reign of Edward VI. that the most important steps were taken for framing a new service-book. In opposition to the practice introduced by the Roman Catholic church, an act of parliament was passed, ordering the communion to be administered to the laity in both kinds, and a formulary was drawn up for this purpose, and used at the end of the Latin mass. In the following year, a complete service-book was drawn up, including offices not only for Sundays and holidays, but for the administering of baptism and confirmation, for matrimony, the burial of the dead, and other occasions, together with the above-mentioned office for the communion considerably altered. This book was compiled by Cranmer and Ridley, assisted by eleven other divines; it was revised by convocation, and confirmed by king and parliament, and published in 1549, and is known as the FIRST PRAYER-BOOK of Edward VI. It differed from the one now in use by beginning the daily service with the Lord's prayer, by retaining prayers for the dead, and directing the use of the sign of the cross in confirmation and visitation services, and the anointing of the sick. It was drawn up with great prudence, retaining as much, and altering as little as possible of what had been familiar to the people. In 1550, the ordination service was added, taken principally from that used by the Roman Catholic church, but omitting certain ceremonies, and adding most of the questions proposed to the candidates. This service differed but little from that now in use, as authorized in 1662.

In 1551, objections, as might be expected, were made from various quarters to this *first* prayer-book, and Cranmer proposed to revise it, and called to his assistance two distinguished foreign reformers—Martin Bucer, and Peter Martyr. In this revision, some of the principal alterations were the addition of the opening sentences, the exhortation, confession, and absolution at the beginning of the service, the disuse of oil in baptism, of unction of the sick, and of prayers for the dead. The book thus altered was confirmed by act of parliament in 1552, and is called the SECOND PRAYER-BOOK of Edward VI.

In the reign of queen Mary, the acts of 1549 and 1552 were repealed, and therefore, at the accession of Elizabeth, it was necessary to reverse this repeal; and this afforded a fresh opportunity of revising the whole. The question then arose (1560) as to which of king Edward's two books should be adopted. The queen herself would probably have preferred the first, as containing many of the old ceremonies to which she was attached, but the second was chosen, and a few unimportant changes introduced. This

may be called the THIRD COMMON PRAYER-BOOK. No alteration was made by it as to the use of church ornaments and vestments, which were directed by the act of uniformity, 1559, to be retained as they were left by the authority of parliament in the second year of Edward VI.

On the accession of James I., after the Hampton court conference, the book was again revised; and a few judicious changes made, e.g., some forms of thanksgiving were added for special occasions, and the explanation of the sacraments by Dr. Overall after the catechism; midwives and laymen were also prohibited from baptizing. In this state, the C. P. was left until the restoration, when, at the request of the Presbyterians, the king consented to a fresh revision, 1661. Twelve bishops were appointed to confer with an equal number of Presbyterian divines, each side having nine coadjutors. They were to consider the principal objections raised against the liturgy as it then stood. This was called the Savoy conference. The Presbyterians brought forward all the objections that had been made by the Puritans for the last century, adding new ones of their own. Baxter went so far as to say that it was incapable of amendment, and was bold enough to offer an entirely new liturgy of his own composition to be received in the place of the authorized one. It is hardly necessary to add, that the conference broke up without anything being done, except that the bishops proposed a few alterations, which were adopted by convocation in 1662, and confirmed by act of parliament. Among these changes, the new authorized version of the Scriptures was adopted, except in the Psalms (which follow the version of Coverdale's Bible, and had become familiar to the people), and in the commandments and the sentences at the communion service; the general thanksgiving was added, and the form of prayer to be used at sea. It is proper to observe that the four forms of prayer known as the *state* services —viz., for Gunpowder treason, on Nov. 5; for king Charles's martyrdom, Jan. 30; for the restoration, May 29; and the king's accession; were never properly a part of the C. P., but were annexed to it by order of the king in council at the beginning of every reign. Upon an address of both houses of parliament, in conformity with the wish of the clergy, an order in council was given by queen Victoria for discontinuing the first three. There have been four acts of uniformity—viz., in 1548 and 1552, both of which were repealed by that of Elizabeth in 1559; and the last in the 14th year of Charles II., 1662, which left that of Elizabeth unrepealed. In the great rebellion, 1643, the Long parliament prohibited the use of the Common Prayer-book. At the revolution in 1668, no change was introduced into the prayer-book; for although a commission was appointed for the purpose, the second downfall of episcopacy in Scotland in 1689 caused such alarm in the English church that the matter was dropped.

Concerning the use of the English C. P. in Ireland, it is sufficient to say that, in 1551, the first prayer-book of Edward was introduced by the king's authority, after some opposition; and the same prayer-book continued to be used on both sides of the channel till the Irish branch of the united church was disestablished. In 1875, the general synod of the church of Ireland adopted a revision of the C. P., but without essential alteration. In Scotland, which had as yet no settled liturgy, Laud attempted to introduce the English prayer-book, but with alterations in the communion service which were likely to be very offensive to a people so hostile to the church of Rome. This attempt was followed by riots, and ultimately led to the abolition of the Scotch episcopate and to the solemn league and covenant. The English C. P. is now used in most of the Episcopal churches in Scotland, but in some a liturgy resembling that of Laud, but framed by the non-jurors more on the model of the eastern liturgies, is used in the communion service. In the United States, also, the English C. P. is used, with some slight changes.

COMMONS, the dinner provided in English colleges and inns of court for their members. In the inns of court, it is provided only during term. Separate tables are appointed for the benchers (q.v.), for the barristers, and for the students and other members of the inn.

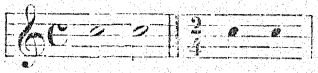
COMMONS, HOUSE OF. See PARLIAMENT.

COMMON SCHOOLS. The Puritan settlers of New England built the school-house by the side of the church even before they had provided permanent homes for themselves. Their first schools (in which Latin was taught) were, however, free in part only, and to those who had contributed to found them. The free public school was of New England origin. A Massachusetts law of 1643 required that every township containing 50 families should have a school for all the children; the tuition to be paid either by their parents or by general provision. In Hartford, Conn., in 1642, a school was instituted and funds for it provided from the public treasury; and in the following year a vote was passed that "the town shall pay for the schooling of the poor and for all deficiencies." New Hampshire and Vermont, in like manner, provided for schools in every hamlet that could furnish employment and support to a teacher. Even amidst the almost constant conflicts with the Indians and French in which the colonies were involved, C. S. were steadily maintained. In 1670, one fourth of the annual revenue of the colony of Connecticut was spent for the support of the common schools. In 1795, the state of Connecticut devoted the money obtained by the sale of her western reserve lands, amounting at the time to $1,200,000, to the support of her common schools. Mass-

achusetts made a similar use of a part of her lands in Maine. Within the last 60 years the system of C. S. has been extended through the northern and north-western states, and the course of instruction has been greatly enlarged. As each state has control of its own schools, there is great variety in the details of their management. The following leading principles are the same in all: 1. A system of graded schools embracing primary, grammar, and high schools. 2. State superintendents who determine by examinations the qualifications of the teachers and watch over the efficiency of the instruction given. 3. Uniformity of text-books. 4. Public examinations. 5. School libraries and illustrative apparatus. 6. Improved construction and furnishing of schoolhouses. 7. Access to the school for all children of suitable age. 8. Normal schools for the training of teachers. Some of the states have funds to aid them in supporting their schools. In the western states these funds are generally large, arising from the sale of lands granted by the general government, and, in some instances, also by the state. Such grants by the United States for school purposes amount to 68,000,000 of acres, valued at more than $60,000,000. In many of the states the attendance of children, within specified ages, and for at least a part of the year, is compelled by law. Before the civil war there was no general and well-ordered system of C. S. in the southern states. But in their new state constitutions they have made provision for them, and are now pressing forward the work. In 1867, a national bureau of education was established by congress for the purpose of collecting statistics and diffusing information on the whole subject, so as to aid the people of the United States in the adoption and support of the best school systems, and to advance in other ways the cause of education through the land. In the year 1878, so far as reported, the school population of the states and territories was 14,617,000; the public elementary schools had 9,213,000 pupils enrolled, 262,000 teachers, and an income of $92,683,000. See EDUCATION, *ante*.

COMMON SENSE, THE PHILOSOPHY OF. There are certain beliefs that have been current among men in all ages, which, when canvassed by one set of philosophers, have been declared to be groundless illusions. Of these, the most remarkable instance is the belief in an external, material world, independent of any mind to perceive it. The doctrine put forth by bishop Berkeley, as opposed to the common opinion, was, that "the whole universe subsists, and can only subsist, within such a sentient, invisible, and conscious thing as the mind is known to be. In this way, each human mind must have within it a separate universe of its own, but so exactly the same in all minds, that every object of sense, and every movement of every object that is to be found in the universe of one mind, is to be found also in the universe that is within the other mind; the general effect of all which conditions is much the same as that which would be produced if several people were all dreaming, exactly at the same time, exactly the same dream." "The result of Berkeley's inquiry," says Dr. Reid, "was a serious conviction that there is no such thing as a material world—nothing in nature but spirits and ideas; and that the belief of material substances, and of abstract ideas, are the chief causes of all our errors in philosophy, and of all infidelity and heresy in religion. His arguments are founded upon the principles which were formerly laid down by Des Cartes, Malebranche, and Locke, and which have been very generally received. And the opinion of the ablest judges seems to be, that they neither have been nor can be confuted: and that he hath proved, by unanswerable arguments, what no man in his senses can believe. Hume proceeds upon the same principles, but carries them to their full length; and as the bishop undid the whole material world, this author, upon the same grounds, undoes the world of spirits, and leaves nothing in nature but ideas and impressions, without any subject on which they may be impressed."—*Inquiry into the Human Mind*, c. 1, s. 5.

A dead-lock in philosophy was the result of those doctrines of Berkeley and Hume; and the solution offered by Reid consisted in setting up C. S. as an arbiter from which there could be no appeal; that is to say, the universally admitted impressions of mankind were to be taken as corresponding to the fact of things without any further scrutiny. Reid's philosophy of C. S. has thus found a place in the thinking-world; and it is only the same view otherwise expressed, when it is declared by other philosophers that the deliverance of consciousness must be presumed true. Sir W. Hamilton, in the most elaborate vindication of the C. S. philosophy that has ever been produced (edition of Reid's works), dwells largely upon this last view of the subject. The following extract is a specimen of his mode of reasoning: "When, for example, consciousness assures us that, in perception, we are immediately cognizant of an external and extended *non-ego* (not-self); or that, in remembrance, through the imagination, of which we are immediately cognizant, we obtain a mediate knowledge of a real past: how shall we repel the doubt—in the former case, that what is given as the extended reality itself is not merely a representation of matter by mind; in the latter, that what is given as a mediate knowledge of the past, is not a mere present phantasm, containing an illusive reference to a real past? We can do this only in one way. The legitimacy of such gratuitous doubt necessarily supposes that the deliverance of consciousness *is not to be presumed true.* If, therefore, it can be shown, on the one hand, that the deliverances of consciousness must philosophically be accepted *until* their certain or probable falsehood has been positively evinced; and if, on the other hand, it cannot be shown



that any attempt to discredit the veracity of consciousness has ever yet succeeded; it follows that, as philosophy now stands, the testimony of consciousness must be viewed as high above suspicion, and its declarations entitled to demand prompt and unconditional assent."

"In the first place, it cannot but be acknowledged that the veracity of consciousness must at least, in the first instance, be conceded. Nature is not gratuitously to be assumed to work, not only in vain, but in counteraction of herself." "But in the second place, though the veracity of the primary convictions of consciousness must, in the outset, be admitted, it still remains competent to lead a proof that they are undeserving of credit. But how is this to be done? As the ultimate grounds of knowledge, these convictions cannot be redargued from any higher knowledge; and as original beliefs, they are paramount in certainty to every derivative assurance." "It will argue nothing against the trastworthiness of consciousness, that all or any of its deliverances are inexplicable—are incomprehensible. To make the comprehensibility of a datum of consciousness the criterion of its truth, would be indeed the climax of absurdity." (P. 745.)

The conclusiveness of this reasoning is disputed by many, who object, that consciousness (q.v.) is a very wide word, comprising indeed everything that we call mind; and it is proverbially unsafe to argue in generalities. Suppose, it is argued, we were to substitute "memory" in the above reasonings, and to maintain that the veracity of each one's memory was beyond all question or dispute, it would be apparent at once how the case really stands. In one meaning, and in one set of circumstances, memory is sure, or even, if we please, infallible—that is, when we record an observation the moment after we have made it. For a short interval of time, a simple fact, or a brief statement, may be recollected with entire certainty. On the other hand, the lapse of days, months, or years, and the complicity of the fact, not to mention the bias of the feelings, are known to cause great uncertainty in our recollection, and in such circumstances we do not implicitly rely on it. In a word, *experience* is the criterion of how far the memory is to be trusted. Possibly, therefore, the same thing may turn out to be true of the larger fact named consciousness.

The truths of C. S., or consciousness, are such as these: the laws of identity, contradiction, and excluded middle (see IDENTITY); the axioms of mathematics; the law of causality (see CAUSE); the doctrine of an innate moral sense (see ETHICS); the doctrine of man's moral liberty (see FREE WILL); the existence of an external world independent of every percipient mind. Such truths are designated by a variety of other names, with a view to contrast them with what we learn in the course of our education and contact with the world; they are termed intuitions, intuitive cognitions, instincts, feelings, beliefs, principles, ultimate or primordial elements, truths *à priori*, transcendental cognitions, truths of the reason, etc.—*Hamilton's Dissertations*, note A. The philosophy of C. S., as promulgated by Reid, bore reference especially to the denial by Berkeley of the received view of the material world—a subject which falls to be considered under PERCEPTION.

COMMON TIME, in music, is that species of measure which contains two minims or two crotchets in a bar. It is marked thus:

COMMONWEALTH OF ENGLAND, the title of the government of England under Cromwell, from the death of Charles I., Jan. 30, 1649, to the restoration of Charles II., May 29, 1660. (See CROMWELL, OLIVER, *and*.)

COMMUNE, the smallest administrative division of France, much like the town and village local government organizations in the United States. The C. is a legal body, and can buy and sell property, contract debts, and appear in the courts. The chief magistrate is the *maire* (mayor), who is assisted by one or more adjuncts, and a deliberative assembly, called the *conseil municipal*. As the agent of the national government, the *maire* is charged with the local promulgation and enforcement of laws and decrees; and, as a member of the municipality, he has to attend to the police, the revenue, and the public works of the C., and in general to act as the representative of the corporation. In communes that rank as the administrative centers of a department, arrondissement, or canton, or that have a population of more than 3,000, the *maire* is nominated by the central government; in those not so distinguished, the appointment is made by the prefect of the department. The councilors are elected by the votes of the communal electors, and hold office for five years.

COMMUNE DE PARIS, the organized socialists and workingmen who revolted against the French government March 18, 1871, a few days after the evacuation of Paris by the Germans, subsequent to the long siege and capture. The national guard of Paris were permitted to retain their arms, and a large proportion of them joined in support of the commune. The more prominent among the leaders of the commune were Felix Pyat, Flourens, Assi, Delescluze, Paschal, Grousset, gen. Cluseret, Dombrowski, Arnoud, Jules Valles, Blanqui, and Rochefort. Their principles are a subject of much dispute,

but it is fair to quote this definition by one who belonged to the fraternity: "Their philosophy is atheism, materialism, the negation of all religion; their political programme is absolute individual liberty by means of the suppression of government, and the division of nationalities into communes more or less federated; their political economy consists essentially in the dispossession, with compensation, of the present holders of capital, and in assignment of the coin, land, etc., to associations of workmen." The same writer affirms that "the central committee of the national guard, exclusively composed of workmen, members of the Internationale, has taken the initiative, and alone has the merit of the movement." The national guard being divided in sentiment, the communists gained control of the city. Convicts released from the prisons, and foreign refugees, joined them. The more intelligent of the leaders, who had some moral scruples, were soon discarded, and desperadoes and outlaws obtained complete control. An election for the choice of members of the commune was held on the 26th of March, but the friends of order declined to vote, and the insurgents had an easy triumph. After the result was ascertained, the leaders issued a proclamation in these words: "The central committee has remitted its powers to the commune citizens; your commune is constituted. The vote of the 26th of March has sanctioned the victorious revolution," etc. The government at Versailles sent a force to suppress the insurrection. On the 2d of April, a body of insurgents marched against Versailles, but were repulsed at Meudon. Gustave Flourens, one of the commanders of the commune, was soon afterwards killed. The army of the republic, under command of marshal McMahon, began the siege of Paris. Dombrowski, Cluseret, Rossel, and Delescluze, successively held command of the insurgent forces. The commune was torn with dissensions, which greatly diminished their power of resistance. On the 5th of April, they arrested the archbishop of Paris and others, and imprisoned them as hostages. Possessing several forts in the environs, the insurgents made an obstinate resistance to the advance of McMahon; but they were at length overcome. After capturing several of the forts, the besieging army, 90,000 strong, entered Paris by several gates on the 22d of May, and inclosed the insurgents in a semicircle; but the latter fought for five days behind barricades, committing atrocious acts of cruelty and vandalism. They set fire to the public buildings, and threatened the destruction of the ancient monuments and treasures of art. Among the fine edifices which they burned were the Tuileries, the Palais de Justice, the Palais Royal, and the Hôtel de Ville. The Louvre was partly consumed. They shot Darboy, archbishop of Paris; Boujeau, president of the court of cassation; and others whom they had held as hostages. In the execution of their incendiary schemes they ignited petroleum, gunpowder, and other explosive materials in many places. At length, on the 27th of May, the contest ended; 25,000 communists were taken prisoners, some of whom were put to death, while a number were sentenced to deportation. Delescluze was killed while fighting in the street. Most of the ringleaders who survived the battles were put to death. All but a very small number of those who were banished were amnestied in 1880.

There was a still older commune in Paris—that of 1790, which was created by law, but soon proved stronger than its creators. This commune bore a leading part in the worst outrages of that terrible era. See PARIS, *ante*.

COMMUNICA'TIO IDIOM'ATUM, a term denoting the doctrine that the one person of Christ has conjoint possession of the attributes of two natures; the two natures being inseparable, so that whatever in either nature is proper to Christ in the abstract, belongs to him in the concrete.

COMMUNION signifies, in ecclesiastical language, that relation, involving mutual claims and duties, in which those stand who are united by uniformity of belief in one religious body or church. To exclude from this relation and its involved rights, is to *excommunicate*. The most visible symbol of this relation being the partaking together of the Lord's supper, that rite is often called the communion. See LORD'S SUPPER.

COMMUNION IN BOTH KINDS. It is universally acknowledged that in the primitive church, at the celebration of the Lord's supper, both the bread and the cup were distributed to all who communed. Sects which, like the Manichæans, discarded the wine were condemned as irregular. As, however, there was frequent occasion to carry the consecrated elements from the church to sick persons at their homes, it became customary, for convenience, to dip the bread in the wine, administering, in this way, both in one. At length it was thought more convenient to omit the wine. In the 13th c., Robert Pulleyn, of Oxford, approved the custom of giving to the laity the bread only, in order, as was said, to avoid the danger of spilling the wine. This view was adopted by the scholastic theologians, who taught that Christ was wholly present in the sacrament under either form, and that, consequently, one form was sufficient for a valid observance of it. Thomas Aquinas and Bonaventura, especially, advocated the administration of the communion under one form only. In proportion as the doctrine of transubstantiation was developed, it became the practice of the church to withhold the cup from the laity. Against this the reformers of the middle ages, as the Waldenses, Huss, Wyckliffe, and Savanarola, protested. The Protestant churches, also, were united in regarding the communion in both kinds as essential to the right observance of the ordinance. The practice of the Roman Catholic church was confirmed and made bind-

ing by the council of Trent in 1563. It has always since been adhered to, and is defended on the ground that the cup is not necessary to the completeness of the sacrament. Since the whole Christ, as to his body, soul, and divinity, is not only in each species, but in every particle of both, he who receives the consecrated bread receives the whole Christ, and derives all the benefit from communing that the sacrament can afford. But while this law is uniformly enforced in the western Roman Catholic church, those portions of the eastern churches that acknowledge the supremacy of the pope are allowed to retain both forms; and the same toleration has been offered to Protestants in order to facilitate their return into the unity of the church under the Roman see. See LORD'S SUPPER, *ante*.

COMMUNION SERVICE. See COMMON PRAYER-BOOK and LITURGY.

COMMUNISM, the name given to one class of the arrangements by which certain speculators have proposed to dispense with those laws of social and political economy which are supposed to keep society together, through the influence of the domestic affections and the spirit of competition, and to substitute in their stead a set of artificial rules for the government of mankind. The word socialist has generally been applied to those who only propose to interfere with labor by abolishing competition and wages, leaving men to work under the influence of public spirit, and making an equal division of the produce. See SOCIALISM. The term communist, on the other hand, has been applied to those who go a step further, and propose to abolish the relation of husband and wife, along with the system of domestic government which is founded on the parental authority. While Louis Blanc may be considered the head of the socialists—though his ultimate aim was work according to capacity, and payment according to wants—the representatives of the communists are Robert Owen, St. Simon, Fourier, Proudhon, and Enfantin.

Although we usually consider C. an especially French fallacy, the first consistent practical teacher of it was our own countryman, Robert Owen. He published, in 1813, *A New View of Society, or Essays on the Principle of the Formation of the Human Character and the Application of the Principle to Practice*—in which he printed in large capital letters, as the key-note of his system, the following announcement: "That any character—from the best to the worst, from the most ignorant to the most enlightened—may be given to any community, even to the world at large, by applying certain means which are to a great extent at the command and under the control, or easily made so, of those who possess the government of nations." No alarm was felt either at such a text or the comments made on it; nor did the world see what the author meant by the hint that there were special artificial means for improving the breed, as it were, of mankind, until he struck at the root of the domestic organization, by such announcements as the following: "The affections of parents for their own children are too strong for their judgments ever to do justice to themselves, their children, or the public in the education of their own offspring—even if private families possessed the machinery (which they never do) to well-manufacture character from birth." He formed an organization, too complex to be here detailed, by which families were to be subjected to a discipline which, that it might be perfectly uniform, should be carried out in parallelograms. Anticipating the results, he said: "These new associations can scarcely be formed before it will be discovered that by the most simple and easy regulations all the natural wants of human nature may be abundantly supplied; and the principle of selfishness—in the sense in which that term is here used—will cease to exist, for want of an adequate motive to produce it." He attested his reliance on the efficacy of his invention by sinking his own fortune in an attempt to build a parallelogram. It was commenced in the year 1825, at Orbiston, in Lanarkshire; but he did not meet with sufficient co-operation, and as his own funds only sufficed to build one corner of the parallelogram, it was impossible to give effect to arrangements which were fitted only for a completed edifice in that geometrical form. A considerable number of people—about 200, it is said—lived for some time in the building, little to their own advantage or that of the neighbors, who were naturally prejudiced against them, and probably exaggerated their irregularities; the building was soon deserted, and afterwards was totally obliterated. Owen had another opportunity of trying his parallelogram organization in 1843, when "Harmony Hall" was established in Hampshire by the zealous efforts of his followers, who formed a sort of sect in England. Still, his theory had, as he deemed it, anything but fair-play, since so far did his disciples depart from that absolute undeviating conformity to the "rational" system, as laid down by him, that they got tired of his incessant reiteration of it, and deposed him from his office of "President of the Congress."

Attempts to realize C. abroad were not more fortunate. Fourier's system was to be realized in "phalanxes," each containing four hundred families, or about 1800 persons. A sum of about half a million of pounds is said to have been spent in the establishment of a "phalanstery" at Rambouillet. It failed, and the founder of the system, like Owen, attributed the failure to the scheme being but imperfectly developed. The St. Simonians established a college or corporation at Menilmontant, with a "supreme father" at their head. The leaders were brought to trial by the government of Louis Philippe, on a charge of undermining morality and religion. They were subjected to

imprisonment, and not having public feeling with them, they were unable to bear up against the contumely thus thrown on them.

Communism, in the sense of having all things in common, is not to be confounded with the idea for which the communists of Paris fought in 1871 (see PARIS); that idea was political rather than social, although the same persons may often hold both doctrines. *Commune* is the designation of the lowest administrative division in France, corresponding in rural districts to an English parish or rather township, and in regard to cities, being equivalent to municipality. The communist doctrine is, that every such commune, or at least every important city commune, like Paris, Marseilles, etc., should be a kind of independent state in itself, and France merely a federation of such states. This idea has taken deep hold of the extreme democrats, not only among the town populations of France, but also in Spain, and, to a less extent, in other parts of the continent. It was the very opposite idea for which the great civil war in the United States was fought and won.

COM'MUNISM (*ante*). So far as America is concerned the theory and practice of C. have made little progress. Socialism has been tried, and with some degree of success; but community of property and of interest has been emphatically rejected. In a land where all men are free, where all roads to prosperity and office are open to all men, where there is no caste, and, since the extinction of slavery, no degree of citizenship (except as relates to Indians and Chinese), there is little opportunity for those who would organize public robbery because one man has more acres or more dollars than another. Indeed, nearly all that has been heard in the United States in favor, or even on the subject of C., has been forced upon the public ear by discontented spirits from abroad. It is waste of time to prate about tyranny and kings where every man wears a crown. But since half a dozen screaming and worthless grasshoppers will make more noise in a clover field than ten thousand industrious and honest bees, we must perforce consider their noise and its purport. The very corner-stone and starting-point of the communists is the overthrow of the institution of private property, "that primary and fundamental institution on which, unless in some exceptional and very limited cases, the economical arrangements of society have always rested." Naturally the opinion that a communist is one who has no property to lose, and who therefore advocates a general re-distribution of wealth, is widespread and popular. Such movements against property have taken place in almost every country and in nearly every age. They have originated with men as far apart in time and intellect as Plato and Robert Owen, and with men as different in social surroundings as sir Thomas More, St. Simon, and father Rapp. The mention of these names goes far to refute the popular idea that communists are always needy adventurers, seeking to possess themselves of the property of others. Among the modern leaders of C. who have actually reduced to practice the theoretical schemes of Plato's *Republic* and sir Thomas More's *Utopia*, have been some who have devoted great wealth and rare organizing faculty to the realization of their plans for the reconstruction of society. It has been estimated that during his life Robert Owen devoted as much as $300,000 of his own private fortune to the promotion of communistic schemes. He had a wonderful faculty for business, and to him the accumulation of money was natural and easy. The great pecuniary sacrifices made by him in the cause of C. showed that he at least was animated by motives the direct opposite of the selfishness and sloth generally attributed to the advocates of the system. Much the same remarks, so far as pecuniary interest is concerned, might apply to St. Simon of France, and to John Humphrey Noyes, the head of the Oneida community, in New York. In many countries the men foremost in thought and action have been more or less attracted by communistic schemes. These schemes have been so various in scope, and the amount of detail with which they are described by their authors is so considerable, that it is difficult to get at the underlying principle common to them all. It must be remembered that the philosophic C. of Plato and More has been adopted to the wants of actual daily life by rough German peasants and Lancashire cotton-weavers; and though, of course, the actual has differed much from the ideal commune, yet their resemblance is, under the circumstances, very much more striking than their divergence. In Plato's *Republic* the dissatisfaction is not limited to merely economical conditions. In his examination of the body politic there is hardly any part which he can pronounce healthy. He would alter the life of citizens of his state from the moment of birth. Children would be taken away from their parents and nurtured under the supervision of the state. The old nursery tales, "the blasphemous nonsense with which mothers fool the manhood out of their children," are to be suppressed. Dramatic and imitative poetry are not to be allowed. Education, marriage, the number of births, and the occupation of the citizens, are to be controlled by the guardians or the heads of the state. Perfect equality of conditions and careers is to be preserved. The women are to have similar training with the men, and no career and no ambition is to be forbidden to them. The inequalities and rivalries between rich and poor are to cease, because all will be provided for by the state. Other cities are divided against themselves. "Any ordinary city, however small, is in fact two cities, one the city of the poor, the other of the rich, at war with one another," but this ideal state is to be a perfect unit; although its citizens are divided into classes according to their capacity and ability, there is none of the exclusive-

ness of birth, and no inequality is to break the accord which binds all the citizens, both male and female, into one harmonious whole. The marvelous comprehensiveness of the scheme for the government of this ideal state makes it belong as much to the modern as to the ancient world. Many of the social problems to which Plato draws attention are yet unsolved, and some are in process of solution in the direction indicated by him. He is not appalled by the immensity of the task which he has sketched out for himself and his followers. He admits that there are difficulties to be overcome, but he says "Nothing great is easy." He refuses to be satisfied with half measures and patchwork reforms. "Enough! my friend!" he exclaims: "But what is enough when anything is wanting?" These sentences indicate the spirit in which philosophical as distinguished from practical communists, from the time of Plato until to-day, have undertaken to reconstruct human society. Sir Thomas More's *Utopia* has many of the characteristics of the *Republic*. There is in it the same wonderful power of shaking off the prejudices of the place and time in which it was written. The government of Utopia is described as founded on popular election; community of goods prevailed; the magistrates distributed the instruments of production among the inhabitants, and the wealth which resulted from their industry was shared by all. The use of money and all outward ostentation of wealth were forbidden. All meals were taken in common, and they were rendered attractive by the accompaniment of sweet strains of music, while the air was filled with the scent of the most delicate perfumes. More's ideal state differs in one important respect from Plato's. There was no community of wives in Utopia. Thus a oneness of the family relation and fidelity to the marriage contract were recognized by More as indispensable to the well-being of modern society. Plato, notwithstanding all the extraordinary originality with which he advocated the emancipation of woman, was not able to free himself from the theory and practice of regarding the wife as part and parcel of the property of her husband. The fact, therefore, that he advocated community of property led him also to advocate community of wives. He speaks of the "possession and use of women and children," and proceeds to show how this possession and use must be regulated in his ideal state. Monogamy was to him mere exclusive possession on the part of one man of a piece of property which ought to be for the benefit of the public. The fact that he showed no capacity to think of wives otherwise than as the property of their husbands only makes it the more remarkable that he claimed for women absolute equality of training and careers. The circumstance that communists have so frequently wrecked their projects by attacking marriage and advocating promiscuous intercourse between the sexes may probably be traced to the notion which regards a wife as being a mere item among the goods and chattels of her husband. It is not difficult to find evidence of the survival of this ancient habit of mind. "I will be master of what is mine own," says Petruchio; "she is my goods, my chattels." In More's *Utopia* we find the singular anomaly of slavery existing side by side with institutions which otherwise embody absolute personal, political, and religious freedom. Slaves he would have for all sordid services; and the institution of slavery was made supplementary to the criminal system, for the most part of the slaves were men who had been convicted of crime; and slavery for life was made a substitute for capital punishment. Besides the points mentioned, More's proposals comprise universal compulsory education, a reduction of the hours of labor to six hours per day, the employment of all adults, the most modern principles of sanitary reform, a complete revision of criminal legislation, and absolute religious toleration.

The point of education has been a strong one with theoretical and also with practical communists, as the labors of Owen in that direction clearly show. It is to be observed that communists have seldom relied on their peculiar system alone for the regeneration of society. Community of goods has indeed been their central idea; but they have almost invariably supported it by other projects of less questionable utility. Compulsory education, free trade, and law reform, the various movements connected with the improvement of the condition of women, have found their earliest advocates among theoretical and practical communists. They denounce the evils of the present state of society; the hopeless poverty of the poor, side by side with the self-regarding luxury of the rich, seems to them to cry aloud to heaven for the creation of a new organization. They proclaim the necessity of sweeping away the institution of private property, and insist that this great revolution, accompanied by universal education, free trade, a perfect administration of justice, and a due limitation of the numbers of the community, would put an end to half the self-made distresses of humanity. Has it never occurred to them that a similarly happy result might be attained if all these subsidiary reforms were carried out, leaving the principles of private property and competition to their old performance in the economic world? If the principles of C. and of private property are to be fairly compared, the comparison must not be between C. as it might be and private property as it is. C. to be successful requires to be accompanied by important reforms, towards which existing society, founded on private property, is gradually finding its way. The power which society, as at present constituted, has shown of adapting itself to altered circumstances, and of assimilating by slow degrees the more valuable concomitants of the most revolutionary theories, is strong proof that it does not deserve to be dealt with in the summary manner advocated by the communists.

Thirty year ago Louis Blanc was the foremost advocate of C., and he took strong

grounds against the education of the poor. In his work on the *Organization of Labor*, published in 1839, he says that in the existing order of society the spread of education among the masses would be dangerous—would, in fact, be impossible. This, if true, would be the strongest possible indictment against the existing order of society. But how have events falsified the assumptions made in the following passage—"We have seen why in the present system the education of the children of the people was impossible. Many thinking persons consider that it would be dangerous to impart instruction to the lower classes; and this is true. But do they perceive that this danger of education is an overwhelming proof of the absurdity of our social arrangements? Everything is wrong in the social order. Work is not held in esteem. The most useful trades are looked down upon. The workman is, to say the least, an object of compassion, while there are not found crowns enough for a ballet dancer. That is—yes, that is why it is dangerous to educate the people." Hence he concludes, a social revolution ought to be attempted; a new system of society ought to be introduced; the old system of society is, he says, so full of iniquities that it cannot co-exist with a diffusion of education among the people. Even at the time when these words were written there was much to show that they were not true. Since they were written the spread of education has been most general in those countries in which the old social order, founded on private property and competition, is unshaken. Germany, Scotland, and America have educated the people, and they are distinguished among other countries for possessing a peaceful, law-abiding, and order-loving population. So far from education being a danger to the institution of private property, nearly every one has been convinced by events that property is much more seriously threatened by ignorance and by the helpless desperation which ignorance brings; and the old order of society has recognized the necessity of protecting itself by the diffusion of education.

Passing over the war upon banks and banking made by Louis Blanc and his followers, and the equally bitter opposition by the German communists to the wonderfully successfully credit banks of that country, which were devised for the express benefit of the laboring classes, we come to the question of excessive population, which is almost always one great cause of famines and deep depression among the poor. The greater part of communist writers passionately deny this, and denounce with much vigor the idea promulgated by Malthus that population tends to increase faster than subsistence is capable of being increased. No one, however, has attempted to throw a doubt upon the main fact on which the Malthusian doctrine rests, that everywhere, except in very new countries with a large extent of unoccupied fertile land, checks on population are in active operation. Such checks must exist everywhere where population does not increase at its greatest possible speed. Under favorable conditions population has sometimes doubled itself in 20 years. In the 38 years between 1767 and 1805 the population of Ireland doubled. At the rate of increase shown by the last census the population of England would double in 63 years, and that of France in 265 years. In the United States for the ten years before 1860 the increase was very nearly 4 per cent. per year, which would double the population once in 25 years. The civil war in the decade after 1860 renders a comparison for that period worthless. In France and England, therefore, checks on population are, in a varying degree, in active operation; and the same may be said of all old countries. These checks may be divided into two classes, the first carrying with it nothing but misery and degradation, the second implying a high degree of self restraint, independence, and foresight. In the first class may be placed war, pestilence, famine, and all the diseases incident to insufficient food and overcrowding. In the second class may be placed prudential restraint on marriage and the number of births to each marriage, and emigration. Every circumstance which weakens the efficiency of the checks on population comprised in the second class necessarily adds to the force of the checks which we have placed in the first class. In other words, any circumstance which relaxes the force of the prudential checks on population tends to produce the misery of famine, scarcity, and starvation diseases. What would be the effect of communism on the population? Would it strengthen or weaken the motives which promote a prudential limitation of numbers? Nearly all communists, whether theoretical or practical, have faced in one way or another the population question. But the theoretical communists of our times have hardly found words strong enough to express their detestation of the principle that any limitation is desirable to the possible number of births. The writings of Malthus are spoken of as "an outrage on household life." Louis Blanc says it is blaspheming God to say that the prosperity of the poor would be promoted by a limitation of the population. Why are you not logical? he cries; if you were you would recommend that the children of the poor should be put to death. And in another place he speaks of "this political economy without bowels, of which Ricardo has so complacently fixed the premises, and from which Malthus has drawn in cold blood the most horrible conclusions. This political economy contained in itself a vice that was to make it fatal for England and for the world." But practical communists have met the question of population in a different spirit. Several of the most successful realizations of communistic life have maintained the strictest celibacy among their numbers. The Essenes, who practiced community of goods before the Christian era, were a sect composed entirely of men who lived in seclusion from the world, and were in many import-

ant respects the prototypes of Christian hermits or monks. Two of the most important communistic societies in the United States have also made celibacy an essential feature of their system. The Economists and the Shakers, dating back respectively to 1805 and 1792, are strictly celibate, their numbers being recruited from the outside world and to a slight extent by the adoption of pauper children and orphans. Among the Moravians marriage is not permitted to take place without the consent of the heads of the society, who furnish the newly-married with a suitable marriage portion. The Separatists, another American community of German origin, established in 1817, favor celibacy although they do not enforce it. No marriage can take place without the consent of the trustees of the society; and they further discourage marriage by entering among the articles of their religion a declaration of their belief that celibacy is more in accordance with the divine will than marriage. The Amana, another American community of German origin dating from the last century, discourages marriage among its members, and no man is permitted to marry under 24 years of age. Even the Perfectionists, who have a most extraordinary system of complex marriage, take many precautions against a superabundant population. The number of births is controlled by the heads of the society. The practical answer made by the communists to the population question, even in so wealthy a country as the United States, in which unoccupied fertile land can be easily and cheaply obtained, is that a strict limitation of numbers is absolutely essential to their social and industrial well-being. As a matter of fact the population of nearly all the American communistic societies has not increased at all, but has greatly declined during the last 50 years. In 1823 the Shakers numbered 3,809; in 1874 they were only 2,415. The Icarians, the only American community which makes marriage compulsory, have declined in 25 years from 1500 to 65.

It should not, however, be concluded from these facts that the general adoption of C. would tend to strengthen the prudential checks on population. We have seen that modern communists, when freed from the trammels of actual experience of the daily working of the system which they advocate, have vigorously denounced the theory and practice of Malthusianism. The American communists have declined in numbers partly in consequence of the adoption into the communities of celibacy as a religious principle. It is also impossible to avoid the conclusion that their numbers have fallen off partly in consequence of the unattractive conditions of communistic life. The young members of these societies not unfrequently leave them when they arrive at manhood or womanhood. The routine and absence of spontaniety of a communistic life is a weight to young and active minds that is not counterbalanced by a security from want, or a mere bread-and-butter prosperity. The number of marriages and births have been controlled in others of these societies in virtue of the absolute despotism which is vested in the chiefs; individual liberty is entirely suspended; the smallest minutiæ of the daily life of their members is regulated from headquarters. "A government which decides at what hour its subjects shall go to bed at night and rise in the morning, which prescribes the color, shape, and material of the dresses worn; the time of meals, the quality and quantity of food, and the daily task apportioned to each member; which enforces a rule that each of its subjects shall leave every morning a notice stating at what exact spot he or she will be found during each hour of the day; a government which can do all these things will find no great difficulty in controlling the number of marriages and births. The fundamental principle of communal life is the subordination of the individual's will to the general interest, or the general will. Practically this takes the shape of unquestioning obedience by the members towards the elders or chiefs of their society." If, however, C. were adopted throughout a whole nation, the minute despotism which now distinguishes the government of existing communistic societies, and which furnish them with an effectual control over the growth of population, would cease to be possible; or if, indeed, it should ever become possible it would be through the careful supervision of individual liberty, and through the strenuous encouragement of everything which tended to destroy self reliance on the part of the people, and to build up the absolute power of the state. A people who purchased material prosperity at the price of their liberty would strike a bad bargain, especially when it is remembered that the limitation of the number of marriages and births which is enforced by the central authorities in a communistic society can be effected by voluntary self-control in a society based on private property and competition. The difference, therefore, as far as the population question is concerned, between communistic and private property is whether the necessary restraint upon the possible number of births shall proceed from the direct intervention of the state, or whether it shall proceed from the combined motives of self-interest, self-control, and parental obligation on the part of the people themselves. It should be remembered that what communists profess to be able to do is to insure to every member of a communistic society an ample supply of the necessaries and conveniences of life. If the population question is pressing when the almshouse and charitable contributions are the only refuge of those who cannot maintain themselves, would it not become much more pressing if a man could obtain freely, and without fulfilling any disagreeable conditions, food, house, and clothing for himself, and as many children as he chose to bring into existence? It is this consideration which has forced upon the government of communistic societies the control of the marriages and births of their members. Wherever the principles of C. are adopted in

so very materially modified a form as they are in the English poor-law system, legislative control over population has been enforced. The regulation which separates husband and wife in the workhouse is a practical recognition of the principle that where the state guarantees a maintenance it must, in self-protection, exercise control over the members of those dependent on it for support. Self-help brings with it self-control; state help makes state control indispensable. In the present economic condition of society the solution of the population question is not to be found in placing in the hands of the state, as C. has done, absolute control over domestic life. The solution of the problem must be sought in education, in an improved standard of comfort, and a determination on the part of the people not to sink below it, and in a reform of the poor laws and in systems of indoor and outdoor relief.

There are some charges made against C. which may be brought with at least equal force against the economic and industrial arrangements which now prevail. One of these is that C. does not avail itself sufficiently of the motive of self-interest, in order to obtain from each laborer the best and most conscientious work of which he is capable. If, it is urged, the result of man's industry belongs not to himself solely, but to the whole community of which he is a member, he will not throw the same energy and zeal into his work as he will if everything he produces belongs solely to himself. There can be no doubt of the truth of this statement; self-interest is a force on which industrial machinery chiefly relies for motive power. But it is remarkable that the prevailing system of working for fixed weekly wages checks the play of self-interest in the workman much more completely than it is checked in the communistic society by the fact that the results of the labor of each are shared by all. A workman who is in the receipt of fixed weekly wages has no motive to reach any higher standard of excellence or expedition in his work than such as will prevent him from being discharged for bad work or laziness. It is a complaint constantly heard among employers of labor that the only ambition of the men seems to be the doing the least work possible for their wages. The actual existence of the feeling among workmen is proved by many of the rules of trades' unions—such as that which limits the number of bricks which a hod-man is allowed to carry, and which in one case forbade the use of wheel-barrows in taking bricks from one spot to another. Thornton's book *On Labor* gives several examples of the rules adopted by trades' unions to check the tendency which is sometimes found in a workman to exert himself to do his best, and thus show his superiority over his fellows. "Not besting one's mates" has by several English unions been made a social enactment. Such examples are sufficient to show that the present industrial system does not bring into play the motive force of direct self-interest in stimulating the exertions of the laborer. In this respect C. would seem at first sight to compare favorably with mere wages-receiving industry; for in a communistic society every man and woman has some direct share, however small, in the result of his or her labor. If more is produced, there will be more to receive; and instead of a trade union, every member of which is pledged, under penalties, to work slowly and to watch that his fellow-workmen do the same, C. gives to each laborer a direct interest not only in working well himself, but in watching to see that honest and steady work is done by his neighbor. As a matter of fact, the American communistic societies have found no difficulty in enforcing the habit of careful and regular industry on their members. The American communists do not as a rule work hard, for they find that they provide for all the wants of the community without excessive or exhausting toil; but there are no idle members; every one works well and steadily while he is working. That the quality of their work is good is proved by the fact that their commercial reputation stands very high. The garden seeds of the Shakers, and their brooms, have been celebrated all over the United States for their excellence. "The Oneida perfectionists established the reputation of their silk twist in the market by giving accurate weight and sound material; the woolen stuffs of Amana command a constant market, because they are well and honestly made; and in general they (the communists) have a reputation for honesty and fair dealing among their neighbors wherever their products are bought and sold." It should, however, be remembered that a few successful communists afford no test of what would be the effect of a general adoption of C. on industrial activity and efficiency. In the United States there are only about 5,000 communists, children included; and though there are eight different societies, these are divided into 72 separate communities, the Shakers alone having 58. On an average, each community consists of less than 70 persons. The elaborate despotism of communistic government, together with the minute surveillance which the small size of these communities renders possible, makes it easy for the leaders to exact from each member his quota of toil; idleness would be at once detected, and would not be suffered to exist, as the power of expelling an idle member would be resorted to if the voice of public opinion were not sufficient to induce him to mend his ways. Similar means of detecting and preventing idleness would be completely absent if C. were generally adopted. There would, of course, in this case be no power of expelling an idle member, and the difficulty of detecting and proving to the central authorities a disposition on the part of any of the members to avoid a fair share of work would increase step by step with the increase of the size of the community. The motive of self-interest in promoting good work is much more powerful in a small communistic society than in a large one. A man can appreciate the value of his own industry much

more clearly if the resulting product is shared between 30 or 40 persons, every one of whom is known to him, than he can if it were thrown into the common stock of 20,000 people. The weakening of the motive of self-interest which is inherent in C. is reduced to a minimum in small communities; but it would act with fatal results to industrial activity if there should ever be an attempt to make C. universal. For much as the present system falls short of making the most of the great engine of self-interest among those who merely work for wages, there is no such feature among the other industrial classes. Capitalists, land-owners, inventors, traders, members of partnerships, members of co-operative societies, all are brought under the stimulating influence of self-interest, and thus devote themselves to industrial projects with a zeal completely and necessarily unknown among those who work for wages, or those who are members of communistic societies. It is a special feature of co-operation that it brings the motive of self-interest into activity among manual laborers without attempting, as C. does, to overthrow all existing economic institutions. It takes these as they are, and men and women as they are, and suggests a means by which the laborer, no less than the capitalist, can be stimulated by direct self-interest to throw some energy and enthusiasm into his work.

While it has built up co-operation, C. as a system has been a signal failure. In France, the names of St. Simon, Fourier, Bazard, and Enfantin are synonymous with disaster. In England the name of Owen recalls the brief existences of Harmony hall and Orbiston, the establishment of the labor exchange and the issue of labor notes, and a number of other schemes which raised great hopes and expectations that were doomed to speedy disappointment. In the United States the success of C., such as it is, is hardly more encouraging than its failure in Europe. The measure of material prosperity achieved is not very considerable, bearing in mind the length of time most of the societies have existed and the ease and cheapness with which unoccupied land can be obtained. Nordhoff estimates the capitalized wealth of the 72 American communities at $12,000,000. They own from 150,000 to 180,000 acres, or about 36 acres to each person; they possess some of the most fertile soil in the world; one of the Shaker villages owns a magnificent estate of 4,500 acres lying in the famous Miami valley, a soil much of which is so fertile that after 60 years of cropping it will still yield from 60 to 70 bushels of corn to the acre without manuring. The material condition of the inhabitants of the communistic villages compares favorably, no doubt, with that of the German peasant by whom the majority of American communes were originally started; but the monotony, the personal submission, the impossibility of privacy or temporary seclusion, the absence of anything like intellectual activity in these societies, would render the life well-nigh unbearable to people who had been previously accustomed to a higher standard of happiness than that at present within the reach of the ordinary day laborer. Many communistic experiments in the United States have been unsuccessful. Noyes, in his book on *American Socialism*, gives brief histories of no less than 47 of these failures. Comparing the histories of those societies which have died a natural death with that of those which have continued to exist, it is found that the successful societies had no advantage either in the wealth of their members or the intellectual ability of their leaders. Most of the successful societies began poor; most of the unsuccessful societies began with what were believed to be sufficient means to achieve success. Many of the unsuccessful societies were founded by high-minded, highly cultivated men and women, and their members were distinguished for education and intellectual attainments. From these facts, and with ample means through personal experience for forming a correct opinion, Mr. Nordhoff draws the conclusion that in a communistic experiment success depends upon a feeling among all the members "of the unbearableness of the circumstances" in which their lives were originally cast. They must have suffered from wrong and oppression, as well as from want, before C. can appear as a welcome change in their manner of life. Hence the poorer and more narrow and miserable the condition of the people who start a communistic experiment the more likely it is under judicious leaders to succeed. People are easily satisfied when almost any change in their lives must be for the better. It would be undesirable to detract from the achievement of the American communes in raising the poorest and most miserable to a degree of material prosperity which compares with that of well-to-do small farmers in any country. This is no small feat; as they have also proved the possibility of putting C. into practical forms at least on a small scale, and under exceptionally favorable economic conditions. But it is impossible to doubt that their practical value to the world has been in illustrating the limitations and drawbacks of the system. As long as C. remained an unexplored region given over to the dreamers of dreams and the seers of visions, it was impossible to prove that it did not possess all the marvelous perfections which they fondly attributed to it. The American societies offer a life which is confessedly attractive only to those whose original circumstances are exceptionally unfortunate. To those, C. can give, together with a congenial religious atmosphere, material prosperity of a humble type, accompanied by the sacrifice of individuality, liberty, privacy, and intellectual development. It can hardly be denied that these experiments prove that, even were C. on a large scale practically possible, it would never satisfy the aspirations of those who look for a time when increased material prosperity among the working classes, shall be accompanied by a corresponding increase of intellectual activity, political responsibility, and personal independence. The old form of

society seems more favorable than C. to the growth of these qualities; and it is probable that the experiments in the United States may help to establish the conviction among economic revolutionists that more can be accomplished by grafting new institutions, such as co-operation, on the old plan of private property than can be achieved by rooting it up altogether and planting the seedling of C. in its stead. [Portions of this article are taken, with some modifications, from *Encyclopædia Brittanica*, ninth edition.]

COMMUTATION OF TITHES. See TITHES.

COMNE'NUS, the name of a family originally Italian, of which many members occupied the throne of the Byzantine empire from 1057 to 1204, and that of Trebizond from 1204 to 1461. See BYZANTINE EMPIRE and TREBIZOND.—ANNA COMNENA (q.v.), who lived in the first half of the 12th c., is both of historic and literary celebrity.—DAVID C., the last representative of the imperial race in Trebizond, was executed at Adrianople in 1462, with all his family, by command of Mohammed II. The attempt which has been made to trace the descent of the Bonaparte family from a branch of the Comneni settled in Corsica, is not supported by valid evidence.

CO'MO, a province of Lombardy, Italy, on the border of Switzerland; 1049 sq.m.; pop. '71, 477,642. It is a mountainous region, with many small lakes and several rivers, the Adda and Ticino being the most important streams. The products are corn, wine, fruit, silk, etc.; and there are mines of copper, lead, and iron, and quarries of white marble. There are also manufactories of cloth, silk, and woolen goods, paper, fire-arms, etc. The people are generally industrious and in good condition. This province was ceded to Italy by Austria in 1859.

CO'MO, a city of Lombardy, northern Italy, beautifully situated at the s.w. extremity of the lake of Como. It lies in a valley, surrounded by hills, clad with luxuriant gardens, olive-plantations, and orange-groves, with here and there an old ruin cropping out. The city is surrounded by old walls flanked with towers, the gateways by which the walls are pierced being fine specimens of middle-age military architecture. Among the principal buildings of C. are the cathedral, built of marble, and containing some interesting pictures and monuments; the town-hall, also of marble, dating from the beginning of the 13th c.; and the churches of San Fedele and St. Abondio. There are also many fine mansions of the nobility in C. and its suburbs. The port of C., on the lake, is formed of two piers, each terminating in a square pavilion, from which magnificent views are obtained. The inhabitants—including the suburbs—number (1872) 24,350, and are very industrious. The chief articles of manufacture are silk, cotton, woolens, yarn, and soap, the last article having a high reputation. By means of its port, C. carries on extensive trade in the produce of the district with Switzerland. C., in the time of Pliny the younger, had attained to a high degree of prosperity as *Comum Novum*. With the fall of the Roman empire, C. passed out of sight until 1107, when it began to war with Milan, and in the course of twenty years was utterly destroyed by its antagonist. It was rebuilt in 1155 by Frederick Barbarossa, and remained a republic for two centuries, when it fell into the hands of the Viscontis, its history since that time being bound up with that of Milan.

COMO, LAKE OF (Ital. *Lago di Como*, ancient *Larius Lacus*), a sheet of water in Lombardy, northern Italy, lying at the foot of the Lepontine and Rhetian Alps, chiefly formed by the river Adda, which enters it at its n., and issues at its s.e. extremity. The total length of the lake from Como to Riva is about 35 miles. About 15 m. from its northern extremity, the promontory of Bellagio divides it into two branches, the longer of which is between 18 and 20 m.; the other branch is about 12 m. long. The three arms of the lake sometimes receive different names—the upper part as far as Bellagio being called the lake of Bellano; the longer branch, on which the town of Como is built, the lake of Como; and the shorter, the lake of Lecco. Lake Como, however, is the general designation. The greatest breadth of the lake is not more than 3 m., but throughout the greatest part of its length, it is much less. The beauty of the surrounding scenery, and the salubrity of the climate, have made the lake of C. the most celebrated and most resorted to in Italy, its shores being everywhere studded with fine villas. Queen Caroline once had a residence here. Numerous steam-boats ply upon the lake.

COMODO', an island in the Eastern archipelago, 35 m. in length, by 16 in average breadth, lies between Flores on the e., and Sumbawa on the w., being separated from the latter by the strait of Sapi. It is a penal settlement of the kingdom of Bima in Sumbawa. The exports are dried fish and good grinding-stones.

COMONFORT, YGNACIO, 1812–63; a statesman and president of Mexico. He was a member of congress in 1842, and a senator six years later. In 1854, he assisted Alvarez against Santa Anna, and on the resignation of Alvarez he became provisional president. He was proclaimed president in 1857, and in 1858 he was driven into exile. In 1863, he commanded an army to oppose the French invaders who intended to establish Maximilian in power. Near the close of the year, he was assassinated by banditti.

COMORIN', CAPE, the most southerly extremity of the peninsula of Hindustan, being, in fact, a sandy accretion to the termination of the Western Ghauts; while, on the outside of it, are a few detached rocks as a natural breakwater. The headland itself is

so low as not to be visible at the distance of more than 10 m. from the deck of a large ship; and, long before it can be itself distinguished, it is fixed in position, to the eye of the approaching mariner, by a conspicuous peak of the great chain behind it. Its lat. and long. are 8° 5′ n. and 77° 37′ e. Cape C. is in the protected principality of Travancore; and close to it there stands, amid a clump of trees, a village of the same name, with a few fishermen's huts, some venerated temples, and a Dutch church.

COMORN, a co. in Hungary on the Danube; 1145 sq.m.; pop. '70, 143,090, nearly all of whom are Magyars. The n. portion is fertile; the s. mountainous. A very excellent wine is produced. Dotis is one of the principal towns.

CO'MORN, properly Ko'MORN, a t. and fortress in Hungary, situated on the island of Schütt, at the junction of the Waag and the Danube, which is here crossed by a bridge of boats, about 50 m. w.n.w. of Pesth. This island is remarkable for its fertility, as is, indeed, the whole surrounding district. The town, which is irregularly built, with narrow, gloomy streets, contains (1869) 12,256 inhabitants, almost exclusively Magyar. The fortress was erected by Matthias Corvinus, and was restored at great expense in 1805. Its works and intrenchments extend about 7 m. along the banks of the rivers, and it requires for its defense at least 15,000 men and 400 pieces of artillery. It has the reputation of being impregnable, and justified it in the Hungarian war, for the Austrians besieged it in vain from Oct., 1848, to Sept., 1849, and only became masters of it at last in virtue of a capitulation. It has manufactures of woolen and leather, and an active trade in corn, wine, honey, fish, and timber.

COM'ORO ISLES, a group of four islands in the Mozambique channel, between Africa and Madagascar, in lat. 11° to 13° s., long. 43° to 45° 30′ east. The islands, which are of volcanic origin, are called Angaziya or Great Comoro, Anjouan or Johanna, Mayotta, and Mohilla. They are mountainous, the highest peaks rising above 6,000 feet. The soil is fertile. The inhabitants, about 80,000 in number, are principally Mohammedans, but fetichism prevails to some extent. The manufactures are coarse cloths, jewelry, and fire-arms. The island of Mayotta was ceded to France in 1842, and the cession was confirmed in 1845. Here the cultivation of sugar has been encouraged. In 1865, there were produced 39,079 cwts. of sugar; the total exportations were valued at £45,359, nearly all being for sugar; the importations amounted only to £21,954. The people of Johanna find their principal employment in connection with ships calling for provisions. The trade of Comoro and Mohilla is of the same character, but these islands are not so much frequented by ships for the purpose of victualing.

COMPANIES' CLAUSES CONSOLIDATION ACT. See RAILWAYS.

COMPANY. See JOINT-STOCK COMPANY and PARTNERSHIP.

COMPANY, in military organization, is an aliquot part of a regiment or battalion. In the British service, the companies in an infantry regiment are generally ten or twelve, or, if there are two battalions, each has this number of companies. The arrangement is made to facilitate command and evolutions. The capts., lieuts., and sub-lieuts. are all *C. officers*. The capt. is the chief of the C., and the lieut. and sub-lieut. are his subalterns or assistants. The C. is further separated into two *subdivisions*, of two sections each. In round numbers, and without reference to special instances, a full C. may be considered to comprise about 100 men, a subdivision 50, and a section 25. Under the capt.'s superintendence the lieut. commands the first and second sections, the sub-lieut. the third and fourth, with a sergt. to each section. Each C. has its own arm and accouterment chests, and keeps its own books. A cavalry regiment is subdivided into *troops* instead of companies; the engineers and marines, into companies; but the artillery corresponding term is *battery*. In the German army, a company comprises about 250 men, under a capt., who is a mounted officer, and three subalterns.

COMPANY (*ante*). In the U. S. army, all branches of the service are divided into companies. Infantry companies in time of war are expected to number about 100 men. A battalion of infantry has 10 companies, and each company has a capt. and two lieuts. In the cavalry, a company is sometimes called a troop, and in the artillery a battery.

COMPANY, of a ship, is considered to include the whole of the persons engaged on board, and paid for specific duties—exclusive, therefore, of troops and passengers, but including naval officers as well as crew. See CREW.

COMPARATIVE ANATOMY. See ANATOMY.

COMPARATIVE ANATOMY, is the term employed to express that branch of anatomy in which the construction, form, and structure of two or more animals are compared with each other, so as to bring out their features of similarity or dissimilarity. It is sometimes used, in contrast with the term human anatomy, to signify the anatomy of the lower animals, but this is an inexact use of the term, as the anatomy of man may be made comparative when it is examined in comparison with that of animals. The study of comparative anatomy is of especial importance to the physiologist, the embryologist, the veterinarian, and the zoologist. To the physiologist because, from the comparison of the bodies of different animals with each other, modifications in the size, form, and structure of any particular organ can be traced, and conclusions can be

drawn on the importance of the functions of the organ in the economy. Moreover, with a knowledge of comparative anatomy, the physiologist can conduct experiments on animals which have organs similar in structure to those of man, and determine their functions more precisely than would be possible in the human body. To the veterinarian a knowledge of the comparative anatomy of the domestic animals is essential to the study of their diseases. To the embryologist, a knowledge of the anatomy of different animals throws light on the signification of the structural changes which the body of any particular animal passes through in the course of its development. To the zoologist, a knowledge not only of the external form but of the internal structure of animals is essential in order that he may frame a precise system of classification. In the present work the anatomy of the different classes and of some of the more important orders of the animal kingdom is arranged under special heads.

COMPARISON, in grammar, and as applied to adjectives (q.v.), is that which marks the *degree* in which the quality is attributed to the object, as compared with other objects. There are three degrees of comparison. The *positive* indicates the quality generally, without comparison; the *comparative*, a higher degree of the quality than is attributed to other things; and the *superlative*, the highest degree that is attributed to any of the things under consideration. There are two ways of expressing these degrees. 1. By an inflection or change on the word; as, *hard, harder, hardest; happy, happier, happiest.* This mode prevails almost exclusively in Greek and Latin. 2. By an additional word, as *more happy, most happy.* This may be called logical C.; the other, grammatical. In French, with the exception of a few irregular adjectives, all adjectives follow the logical method. In English, the logical method is preferred in every case where the grammatical would produce a word difficult or harsh in the pronunciation. This is generally the case in English when the simple adjective is of more than one syllable; but it is not always so. Thus, *éarnester, prúdenter*, would make harsh combinations; not so *políter, discréeter, háppier.* The difference is, that in *éarnester, prúdenter*, the accent being on the first syllable, two unaccented syllables of discordant character are thrown together; in *políter, discréeter*, the unaccented syllables are separated; and in *háppier*, though they come together, they are of a kind readily to coalesce. Thus, the laws of euphony—which mean, the ear and organs of speech consulting their own convenience—determine this point, as they do much else in language. In general, it is only adjectives of quality that admit of C.; and even adjectives of quality cannot be compared when the quality does not admit of degrees; as, a *circular* spacea, a *gold* ring, a *universal* wish.

Adverbs (q.v.) are compared exactly like adjectives.

COMPASS, MARINER'S, is the name given to the instrument by which sailors are enabled to steer their course on the ocean out of sight of land, and when neither sun nor stars are visible. The ancients, to whom it was unknown, could seldom venture to lose sight of the coast. The directive power of the magnet seems to have been unknown in Europe till late in the 12th century. It appears, however, on very good authority, that it was known in China, and throughout the east generally, at a very remote period. The Chinese annals indeed assign its discovery to the year 2634 B.C., when, they say, an instrument for indicating the s. was constructed by the emperor Hou-ang-ti. At first, they would appear to have used it exclusively for guidance in traveling by land. The earliest date at which we hear of their using it at sea is somewhere about 800 A.D. According to one account, a knowledge of the C. was brought to Europe by Marco Polo, on his return from his travels in Cathay. It was long contended that the C., as a nautical instrument, was first invented by Flavio Gioja, a native of Amalfi, about the year 1362; and that that part of the kingdom of Naples where he was born has a compass for its arms. For this there is no authority whatever, as the C. was well known as a nautical instrument before his time. It is probable, however, that Gioja may have made some improvement in the instrument or in the mode of suspending it. See *British Annual for* 1837.

The essential part of the C. is the magnetized needle, balanced freely upon a fine point; such a needle has the property of arranging itself in the meridian, one end always pointing to the n., and the other to the s. (see MAGNETISM); yet not exactly, but with a deflection or *declination* (q.v.), which varies from time to time in magnitude, and may be towards the w. or the east. The form of the needle is various, some being long flat prisms, others lozenge-shaped. The center of the needle is pierced, and a piece of agate generally inserted, with a conical hole sunk in it, to receive the fine point of the steel pin, so that the free motion may not be hindered by friction. The construction of the rest of the instrument depends upon the purpose it is to serve. For a mariner's C., the needle is fixed to a circular card, on which there is a star of 32 rays marking the 32 *points* of the heavens. The n. point of the card is immediately over the n. end of the needle, and the card moves with the needle. The cardinal points are marked with the letters n., s., e., w.; and the intermediate points other letters. The points are often subdivided into quarters, which are thus marked: n.¼e. (read "n. one fourth e."); n.½e.; n. by e.¼e., etc. A point of the C. being $\frac{1}{32}$ of the circle, is equal to 11° 15′. The C. thus formed is inclosed in a cylindrical brass box; and in order that the C. may remain horizontal in all positions of the ship, the box is suspended

by gimbals (q.v.). The whole is then placed in the binnacle (q.v.), in sight of the helmsman. Inside the box, in the direction of the ship's bow, is a vertical black line called the *lubber-line*, and the steersman must keep the point of the card which marks the prescribed course always in contact with the black line. Compasses differing in some respects from the mariner's C. are also used in surveying and land-measuring; and for the miner they are perhaps as necessary as for the sailor.

The great difficulty connected with the use of the mariner's C. arises from the disturbing influence of the magnetism of the ship. The difficulty is particularly felt in iron vessels, where the deviation of the needle is frequently so considerable as to render the compass almost useless. Various means of obviating this have been suggested; one of these is to place bars of soft iron or magnets in the immediate neighborhood of the binnacle, which being so placed as to cause a contrary disturbance to that of the iron of the ship, leave the needle comparatively free. This is found to answer well in iron ships plying between British and continental or North American ports; but where, as in the Australian passage, they change considerably their latitude, such an arrangement is found to be worse than useless, as the magnetism of the vessel changing with the magnetic latitude, causes an ever-varying deviation of the needle. It has likewise been suggested to place a compass as a standard at the mast-head, where it would be comparatively free from the attraction of the vessel, by which the ship's course might be shaped, the ordinary C. being used merely to give immediate direction to the steersman. In the royal navy, this error is to a large extent obviated in the following way. A C. is placed so high above the deck as to clear the bulwarks, and allow the bearings of a distant object on shore or a heavenly body to be taken while the ship's head makes a complete circuit. In this way, the deviation caused by the iron of the ship in all different positions may be ascertained, and afterwards taken into account.

COMPASSES, instruments for transferring and marking off distances, or for drawing circles, ellipses, etc. The *common C. or dividers* are simply two rods or "legs" joined together at one end by a pivot-joint, and pointed at the other; when used for drawing circles, the lower part of one of the legs is replaced by a pen or pencil *Spring dividers* are much in use by workmen; in these, the legs are united by a strong steel spring, the action of which is to stretch them open; but half-way down, a screw passing between the legs, regulates the degree of opening. The value of these depends upon the permanency with which they retain any degree of opening given to them, pivot C. being liable to slip.

Beam C. consist of points sliding on a long bar, to which they may be clamped at any distance from each other. They are used for greater openings than pivot C. can safely span, and, when delicately made, for more accurate dividing. See GRADUATION.

Proportional C. have a point at each end of each leg, and the pivot between, thus forming a double pair of C. opposite to each other, end to end. If the pivot is midway between the points, the opening of each pair of points will be equal; if the distance from one pair of points be double that from the other, the openings will be as two to one; and so on for any ratio. When a single fixed proportion only is required, the pivot is fixed accordingly; but to adapt them for variable proportions, the pivot is a clamping screw, which moves in an elongated interval in the legs, and may be fixed at any point.

Triangular C. have three legs, so that the points of a triangle may be all transferred at once.

Calliper Compasses. See CALLIPERS.

COMPASSIONATE ALLOWANCE is an allowance made to the children of deceased British military and naval officers left in necessitous circumstances. The annuities vary from £8 to £20 a year, according to the rank of the deceased officer; and are tenable up to the age of 18 in the case of boys, and to that of 21 as regards females, or until marriage if that happen earlier. This measure is more general than a C. A. which arose out of the sympathy of the British nation with the army during the Crimean war. Royal warrants were issued in 1855 and 1856, defining and explaining allowances made to the widows and children, or other specified relations, of military officers who, after the date of the declaration of war with Russia, had been killed in action, or had died of wounds received in that war. The claims on this fund die out as years advance, of course.

COMPASS PLANT, called also "resin weed" because it abounds in resinous matter; a large plant growing on the prairies, whose leaves are said always to point directly or nearly n. and s. When cultivated in gardens this property does not always appear.

COMPASS, SOLAR, an instrument for determining at any place an accurate n. and s. line. It has a range of about 35°, and may be adjusted to the latitude of any place in the United States. It has a latitude arc, a declination arc, and an hour arc, each to be duly adjusted for an observation; and has been found of much service in running important boundary lines, and other government surveys. One of its recommendations is its avoidance of the perplexities caused by local attraction. It is the invention of William A. Burt, of Michigan.

COMPENSATION (Lat. *compensatio*). The doctrine of C., which the law of Scotland and of most of the other states of Europe have borrowed from the civil law of Rome, corresponds to that of *set-off* in England. It provides that where two parties are mutually debtors and creditors, their debts shall extinguish each other, if equal, and if unequal, leave only a balance due. C. must be pleaded, as it does not operate *ipso jure*, but, when pleaded, it is held to operate from the period of concourse, the interest on either side being stopped from that time.

Compensatio injuriarum is a defense against actions of damages for slander or the like. It is not a bar to action, but a *set-off* or counter-claim. In England, it is not allowed to set-off one trespass or tort against another—a cross-action is requisite; and in Scotland, the leaning recently has been in the same direction.

COMPENSATION OF ERRORS, in physics, a method of neutralizing errors which cannot be avoided, by introducing others into the experiment or observation, of an opposite nature, and equal in amount. The compensation pendulum illustrates the principle. See PENDULUM.

COMPETITION (Lat. a seeking together) has been well defined by Dr. Johnson as "the act of endeavoring to gain what another endeavors to gain at the same time." Its most apt exemplification is a race, where all are going to the same point, and all strive to be first there, while though only one can achieve this object, some others will have the satisfaction of being nearer to success than the competitors who are behind them. The most important practical use of the word C. is in the political economy of commerce, where it is the great motive-power of production and enterprise. People work, or embark in trade, avowedly for the purpose of making money. It is the object of the law of the land, as well as of religion and morality, to prevent money-making by immoral means; but within the bounds thus drawn around it, money-making is the object of man's exertion. When the money is made, the next point, always within the same bounds, is to make it go as far as it will. C. works through the co-operation of these motives. The purchaser wants the best article he can get at the lowest price; the producer strives to beat all his fellows, and offer the best article for the price. So thoroughly is this principle established as one consistent with commercial morality and honor, that our railway companies, managed by men of rank and fortune, many of whom are members of the legislature, do not hesitate to make travelers pay a larger fare for going 20 m. on their line to a station not touched by a rival company, than they will charge the same passenger for a journey of 40 or 50 m., if it be to a station which he could reach otherwise.

Whatever may be hereafter accomplished, what we chiefly know of the attempts to supersede C. by some other motive to exertion, is, that they have not been successful. We see every day C. increasing the necessaries and comforts of life, and enlarging the wealth of the community. It is said that there are other and better motives which should produce the same effect, but they have not yet been found. It was an object of the ruling party in the French provisional government of 1848 to abolish C., and place all workmen on a par, as some expressed it, or, according to others, to remunerate them, not according to their services, but according to their wants. A great experiment was tried at the hôtel Clichy, where 1500 tailors were employed to make the uniforms for the national guards, the price of which was to be equally divided among the workmen; but even in that climax of enthusiasm, they did not work up to the mark of the lowest paid of the Paris tailors under the competitive system. As each one felt that the value of any extra exertion would be divided among the whole 1500, instead of being enjoyed by himself, his zeal relaxed, and even the thought of "liberty, equality, and fraternity" was insufficient to rouse it. It appears wonderful that large bodies of the French people should have been so easily deceived by statements of which the fallacy, or rather the actual inaccuracy, would be at once seen through by any working-man in this country. Louis Blanc supposes three competitors for a job. A has a wife and family; he wants 3 francs of wages. B has a wife only; 2½ francs will do with him. But C is a bachelor, who can subsist on 2 francs; therefore, he gets the job, and the others starve. See the second chapter of his *Organization du Travail*, the title of which is "Competition is for the People a System of Extermination." But he leaves out entirely one side of the bargain. Employers compete to get work as much as workmen compete for employment. If the work of B and C be worth, in the market, 3 francs, they will get that whether they have families or not; and it is not the practice of a working-man, any more than of the rest of the human species, to give his work at a third less than its value because he is a bachelor. The Socialists have referred to the public departments—especially to the post-office arrangements in Britain—for instances of services performed without competition. There is, however, in reality, much C. in all the government departments. Although tradesmen may not endeavor to undersell each other by making goods and offering them to the government, yet they endeavor to undersell each other by offering to undertake contracts at the lowest price. Doubtless, the practice of entering on government contracts is open to abuse, if the officers who look after them are careless, and neglect the detection of fraud or inefficiency. But the service of government by contract may be made as effective as any other kind of competition.

There are circumstances in which it is necessary to dispense with the external form of C., but where its influence still rules. For the convenience of the public—especially of travelers—rates of fares are established for cab-drivers, porters, ferrymen, and the like. These men cannot be forced to undertake such functions: they do so because it pays them. Instead of making a separate contract for each job—an arrangement open to fraud and inconvenience—they make a general bargain with the public to serve all-comers. The rate of remuneration they receive ought to be the closest possible approximation to what C. would fix. Whether it is so or not, can be easily tested. If men do not come forward in sufficient numbers to serve the public, then the fixed rate is too low; on the other hand, if there is a superfluity of hands, a percentage of them being at all times unemployed, it is clear that the rate is too high, and that even partial employment in the line is sufficient to induce men to leave other occupations.

One of the most plausible arguments against free C. is, that it throws away labor by producing more goods than are required. Five hundred hats are wanted, but a thousand are produced, and therefore half of them are wasted. In some such shape, the folly and waste of C. are generally illustrated by continental writers. It is very rarely that dealers are so utterly blind to the demand for the article in which they trade. It must be admitted, however, that C., like all other useful things, has its peculiar abuses, and of these perhaps the chief is the propensity which some tradesmen have to carry rivalry to the extent of vicious excitement, and to endeavor rather to get the better of each other than to make their separate fortunes. From this spirit, it frequently happens that when one man has established a successful business in some new locality, another, instead of trying a different business in the same place, or the same business in some other and similar place, sets himself down as a rival, and ruins both. One sets up, for instance, a grocery-shop in a new suburb; he succeeds, but there is not business enough for two; and if a rival sits down beside him, both are ruined; whereas the success of the grocery should rather have hinted that a butchery or a bakery might have a good chance in the same place, or a grocery in some other suburb of similar character. Speculators in omnibuses and other horse-hired vehicles are signally liable to this sort of rivalry, often seeming unable to endure the sight of a brother of the trade driving a good, quiet, tolerably paying business.

C. for public offices—that is to say, the appointment to them of those young men who have shown the highest proofs of ability according to certain tests—has so recently been adopted, that there is little opportunity of judging of its effects. But it must be kept in view, that this is something quite different from the kind of C. referred to above. Clever men may be secured to the public service by such a test, but it is clear that the motive for these clever men, as well as other public servants, doing their duty, must be something in the shape of promotion or otherwise, which will have a constant influence on them after they are appointed. See EXAMINATIONS FOR THE PUBLIC SERVICE.

COMPIÉGNE, a t. in France, in the department of the Oise, stands on the river Oise, a little below its junction with the Aisne, and 33 m. e.s.e. of Beauvais. A fine stone-bridge crosses the river at this point. The town, which is irregularly built, has a tribunal of the first instance, and one of commerce. The inhabitants, numbering (1876) 12,923, are employed in hosiery, rope-making, boat-building, and in traffic in wood and corn. But what best deserves observation at C. is the magnificent palace, built anew by Louis XV., and splendidly fitted up by Napoleon, who often occupied it. It contains a library, a picture-gallery, and other objects worth seeing. The park is extensive, and adjoining the gardens is the beautiful forest of Compiègne, extending over about 30,000 acres. C. is mentioned in the times of Clovis under the name of *Compendium;* and it was the seat of several political assemblies and ecclesiastical councils. It was at the siege of this town, in 1430, that the maid of Orleans was captured; and here, in 1810, Napoleon and Maria Louisa of Austria first met, on occasion of their marriage.

COMPITA'LIA, or LUDI COMPITALIT'II, a festival in Rome in honor of lares compitales, the divinities presiding over places where two or more roads meet. Macrobius says that Tarquinus Superbus restored the festival which had been neglected, and sacrificed boys as a part of the services. Human sacrifices, if ever really made, did not survive the Tarquins, for, after their expulsion, garlic and poppies were offered.

COMPLEMENT is that which completes or makes up a given magnitude to some fixed magnitude. It is most commonly used in mathematics, to signify the arc or angle by which a given arc or angle falls short of a quadrant or right angle: thus, the C. of an arc of 60° is one of 30°; and that of 30° is one of 60°.—The arithmetical C. of a number is the number by which it falls short of the next higher number expressible by tens: thus, the arithmetical C. of 64 is $100 - 64 = 36$.

COMPLEMENT, in music, the quantity required to be added to any interval to complete the octave; for example, a fourth is the C. of a fifth, a third is that of a sixth, etc.

COMPLEXION, the color of the skin, existing in the epidermis and dependent upon certain pigment cells. Those nations most exposed to the weather and least under the influence of civilization are usually of the darkest color. The savages of Australia are black; while the half-civilized people of New Zealand are much lighter, the people of

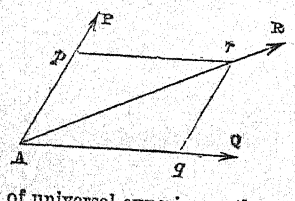
the Friendly islands are often olive colored, while those of Tahiti, who have attained a good degree of civilization, are of a light complexion, and have long flowing hair. The same conditions are found in civilized countries where degrees of rank are observed; the nobility are easily distinguished by their fair and the peasant by their dark features. Blumenbach divides mankind into five classes, according to color: 1. Caucasian, or white, having for the most part a white skin and red cheeks, and hair soft, long, and wavy, sometimes black, but oftener brown, and frequently yellowish. 2. Mongolian, or olive, having a skin of an olive color, and hair black and stiff, straight, and spare in quantity. 3. Ethiopians, or negro, with black skin, and black kinky hair. 4. American, or red, with copper-colored skin, and black, stiff, and straight hair. 5. Malay, with tawny skin, and black, curly hair. Light hair is the usual accompaniment of white and thin skin; while dark hair and dark complexions commonly go together. There does not appear to be any anatomical difference in the skins of the white and the colored races; the changes are the result of temperature, climate, and exposure.

COM'PLINE. See CANONICAL HOURS.

COMPLUTEN'SIAN POL'YGLOT, the edition of the Scriptures issued under the patronage of cardinal Ximenes at a very great cost to himself. It was in six volumes, printed at Alcala in Spain, between 1502 and 1517. The first four volumes contain the Old Testament, with the Hebrew, Latin, and Greek in three columns, the Targum, and a Latin version of the same. The fifth volume contains the Greek New Testament and the Latin vulgate; and the last volume has the vocabularies and indexes. Only 600 copies were printed. And yet, while this great and learned cardinal was expending a large fortune in producing this most valuable polyglot of the Scriptures, he made a wanton and wicked destruction of a vast amount of most valuable literature. This was in consequence of his fiery zeal for the extirpation of heresy. To effect such extirpation and to preclude the possibility of converts returning to their former errors, he caused all procurable Arabic manuscripts to be piled together and burned, in one of the great squares of the city, so as to exterminate the very characters in which the teachings of the infidels were recorded. But from thousands of manuscripts destined to the fire he did reserve about three hundred, all of which related to medical science. His conduct was in strict keeping with that of the Roman Catholic conquerors of Mexico, who destroyed every Aztec manuscript, and as far as possible defaced every inscription that fell under their notice. The modern scholar, groping in the dark for information concerning ancient religions and primitive nations, may well paraphrase Mme. Roland's bitter aphorism: "O religion! what crimes are committed in thy name!"

COMPO'NÉ, or GOBONY, in heraldry. When a bordeur, pale, bend, or other ordinary, is made up of two rows of small squares, consisting of alternate metals and colors, it is called componé.

COMPOS'ITÆ (called by Lindley ASTERACEÆ, and by some botanists SYNANTHERÆ), a natural order of exogenous plants, distinguished by *compound* or *composite flowers*, i.e., heads of flowers which are composed of a greater or smaller number of florets (generally of small size) congregated upon a common receptacle, and surrounded by bracts which form a leafy or scaly involucre, so as to resemble single flowers, which name they ordinarily receive. Another very marked characteristic is, that the anthers of each floret cohere into a cylindrical tube. The order contains both herbaceous plants and shrubs; those which are natives of cold climates being generally herbaceous, and those found in warm regions shrubby, or even arborescent. They have alternate or opposite leaves, without stipules. The florets are either unisexual or hermaphrodite—those of the circumference (or ray) often differing in this respect, as well as in form and color, from those of the center (or disk) of the same head. Bracts (*paleæ*) are often interspersed with the florets upon the receptacle. The calyx is superior, closely adhering to the ovary, and essentially united with it, and afterwards with the fruit, its limb either obsolete or membranous, crowning the ripened fruit, often divided into bristles, hairs, and feathers, which form a PAPPUS (q.v.). The corolla is of one petal, superior, either strap-shaped or tubular, both forms often appearing in different parts (ray and disk) of the same flower (or head), sometimes 2-lipped, very often 5-toothed. The stamens are equal in number to the teeth of the corolla, 4 or 5, and alternate with them. The ovary is 1-celled, with a single erect ovule; the style simple, with 2 stigmas; the fruit dry and not opening (see ACHENIUM); the seed destitute of albumen.—This is the largest of the natural orders of flowering-plants, containing upwards of 1000 genera, and almost 10,000 known species. They are distributed over all parts of the world; but increase in number from the poles to the tropics, and thence, again, diminish towards the equator. In the Linnæan sexual system, they form a distinct class, SYNGENESIA. Jussieu subdivided the order into three sections, and although other subdivisions have been proposed, these are generally recognized as sub-orders—CYNAROCEPHALÆ, having the florets all tubular; CORYMBIFERÆ, having a disk of tubular florets, surrounded by a ray of strap-shaped florets; and CICHORACEÆ, having all the florets strap-shaped. The *cichoraceæ* abound most in cold, and the *corymbiferæ* in warm climates. The artichoke and thistle are familiar examples of the *cynarocephalæ;* the daisy, aster, dahlia, chrysanthemum, chamomile, and sunflower of the *corymbiferæ;* and the dandelion, chicory, and lettuce of the *cichoraceæ*. By cultiva-



tion, many of the *corymbiferæ* are changed so that the florets of the disk assume the same appearance with the florets of the ray, as may be seen in the dahlia, chrysanthemum, aster, etc., and they are then said to be double, although the change which they have undergone is very different from that which has taken place in double flowers of other kinds. The C. are not, in general, of very great importance in domestic economy or in the arts, although many of them are among cultivated and useful plants. Only a few, as the artichoke, scorzonera, salsafy, Jerusalem artichoke, endive, and lettuce, are used for food, and these are of inferior importance in that respect. A very few, as safflower and saw-wort, afford dye-stuffs; and a very few, as the Jerusalem artichoke and chicory, are occasionally cultivated for food of domestic animals; the use of chicory-root as a substitute for coffee is well known. From the seeds of some, a bland fixed oil is expressed—the sunflower, madia, and ram-til being the most important. Many are valuable for their medicinal properties, as chamomile, arnica, wormwood and some other species of artemisia, elecampane, tussilago, blessed thistle, etc. Many are characterized by bitterness; stimulating properties are of frequent occurrence; also anodyne, diaphoretic, diuretic, and narcotic properties. Some, as arnica, are very poisonous. A large number are esteemed ornaments of our flower-gardens, particularly in the latter part of summer and in autumn. Amongst these, the dahlia perhaps holds the first place; and others, scarcely less admired, belong to the genera aster and chrysanthemum. The wood of the sirichout (*tarchonanthus camphoratus*), a small tree of the cape of Good Hope, is close-grained, heavy, and very beautiful.

COMPOSITE ORDER, in architecture. See COLUMN.

COMPOSITION, in art, signifies such an arrangement of the separate objects represented as that they shall all manifestly tend to bring out the center thought or idea which animates the whole. Episodes and digressions are less admissible in æsthetic works of art than in poetry, and less in plastic art than in painting. In all works of art, it is to be borne in mind that the story is to be told to, and apprehended by, the eye alone. There is no surer proof of failure in æsthetic C. than when a picture is found to be totally unintelligible, even to intelligent persons, without the aid of a description in a catalogue. Rules are of little or no avail in this matter. There is but one canon of universal application—viz., that the artist should, in the first place, make it clear to his own mind what his work is to express; and that he should then consider by what arrangement of the objects that must, or may, be introduced into the picture, this will be best accomplished.

COMPOSITION, in bankruptcy, a certain sum per pound which creditors agree to receive from a bankrupt in lieu of full payment of his debts, and the acceptance of which operates as a discharge to the bankrupt, and reinvests him in his estate. In Scotland, the acceptance of a C. bill, unless the contrary be stipulated, only entitles the creditors to rank for the C., and not for the full amount, in the event of a second bankruptcy. If no C. bill be accepted, and there be no accession to a C. contract, it has been held that the creditor may, in a second bankruptcy, rank for his full debt. In a Scotch sequestration, the bankrupt must find security for payment of the C. to the satisfaction of a certain proportion in number and value of the creditors, which proportion varies according to circumstances. The cautioner is only bound for two years, but recourse against the bankrupt is unlimited. The English bankruptcy acts give facilities to debtors to compound with their creditors, and to compel minorities to agree to the C.; but all must be called together, and the proceeding goes through stages analogous to a regular bankruptcy.

COMPOSITION AND RESOLUTION OF FORCES AND MOTIONS. 1. The fundamental problem in statics is to find the magnitude and direction of the *resultant* of two forces; in other words, to compound them into a single force, which shall be in every respect their equivalent. Intensity and direction being the only elements necessary to entirely describe a force, forces in statics are represented by lines, which are obviously capable of being made to represent them both in magnitude and direction. When two forces act along the same straight line on a particle, it is sufficiently obvious that if they act in the same direction, the resultant will be their *algebraical* sum; if in opposite directions, their *algebraical* difference. This being premised, the relation between two forces acting at the same point, but not in the same line, and their resultant, is set forth in the following theorem, which is known as the *parallelogram of forces:* If two forces, P, Q, acting on a particle A, be represented in direction and magnitude by the lines Ap, Aq, then the resultant will be represented in direction and magnitude by the diagonal Ar of the parallelogram described upon Ap, Aq. The proof of this depends upon the simple principles, that a force may be supposed to act at any point of its direction, that point being conceived to be rigidly attached to the particle on which the force acts; and what may be accepted as an axiom of universal experience, that when any number of forces are impressed on a particle or body, each exerts itself, as if the others were not acting, to produce its full effect. See any elementary treatise on mechanics. The doctrine of the parallelogram of forces has

given rise to much controversy, not as to its truth, but as to its derivation, some appearing to contend that it is directly deducible from the axiom above stated, without the necessity of further reasoning.—Knowing how to compound two forces acting at a point, we are able to compound or determine the resultant of any number. If the forces, though in the same plane, do not act at the same point of a body, those of them whose directions meet may be compounded by the preceding rule; if they are parallel, their resultant is a force parallel to them and equal to their algebraical sum, counting those acting in one direction as positive, and in the opposite direction as negative. For the position of the resultant in this case, see PARALLEL FORCES. The singular case is that of equal parallel forces acting in opposite directions. These constitute a couple, and cannot be represented by any single force. See COUPLE.

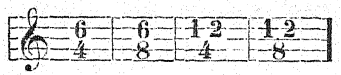
2. The resolution of forces is the converse problem. To resolve a given force R, whose direction and magnitude is Ar, into two forces acting in any directions that may be chosen, as AP, AQ, we have only to draw parallels through r, which determine the lines Ap, Aq, representing the magnitude of the forces required. It is evident that there is an indefinite number of pairs of forces into which Ar might be resolved, according to the direction in which the new forces are to act. It is usual, however, to resolve a force into forces that are at right angles to each other.

3. The composition of motions is analogous in every way to that of forces; motions are the results of forces, and the analogy might be expected. If a body be actuated simultaneously by two velocities having different directions, it will evidently move in a direction intermediate to the two, and with a velocity which will in some way depend on each of them, and which is called their resultant. The proposition which sets forth how to find the resultant, is called the *parallelogram of velocities*. It is: If two velocities, with which a particle is simultaneously impressed, be represented in direction and magnitude by two straight lines drawn from the particle, the resultant velocity of the particle will be represented in direction and magnitude by the diagonal of the parallelogram described on those two straight lines. The proof is very simple. There is no reason why the full effect of both velocities should not be produced, as if the body moved first with one of them, and then with the other, in their respective directions. If in one *second* the body moving with the one velocity would reach p, and if we suppose it then to move on pr for another second, parallel with the other velocity, it would at the end of the second second be at r. Hence, under their joint influence, it will be at r at the end of one second.

4. The resolution of motions is altogether analogous to that of forces.

COMPOSITOR. See TYPE.

COMPOS MENTIS. See INSANITY.



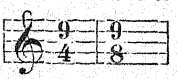
COMPOSTEL'LA, MILITARY ORDER OF ST. JAMES OF. St. James, the elder, was adopted as the patron saint of Spain, after the victory of Clavijo, and his relics were preserved at Compostella, the capital of the province of Galicia. The marvels supposed to be performed by these relics drew vast numbers of pilgrims, for whose support hospitals were established by the pious canons of St. Eloy. The vicinity of the Moors having subsequently rendered the high roads unsafe, 13 noblemen united for the protection of the pilgrims, and, in conjunction with the canons, resolved to found an order of the same kind as that of the Hospitallers or Templars. The pope granted his assent in a bull, dated 5th July, 1175, accompanied with the statutes of the order. Whatever conquests were made from the infidel were declared the property of the order, and a council of 13 knights was vested with authority to elect and depose a grand master. The knights made vows of poverty, obedience, and celibacy, and professed their belief in the immaculate conception. To protect Christians, and convert infidels, they vowed to be the only object in their wars with the Saracens. In most of the great battles between Christian and Moor, the red cross of the order was conspicuous. The conquests of the order itself, combined with the grateful munificence of the nation, speedily increased its wealth and power beyond those of any of the other orders of knighthood. In addition to the three large commanderies of Leon, Castile, and Montalvan, it possessed nearly 200 minor commanderies, comprising, it is said, more than 200 priories, with many fiefs, cloisters, hospitals, castles, boroughs, two towns, and 178 villages, exclusive of its possessions in Portugal. This enormous wealth and power of the order excited the jealousy of the crown, in which, in 1522, the grand mastership was permanently vested by the pope. Having thus become merely honorary and dependent on the crown, the order rapidly decreased in importance.

COMPOSTS are a kind of manure (q.v.), consisting of mixtures of substances adapted to the fertilization of the soil, which being allowed to ferment, and undergo chemical changes for a considerable time in heaps, become more valuable than they were at first, or ever could have been if applied separately. C. were formerly made of farm-yard manure, and earth or lime in addition. Road-scrapings, peat-moss, leaves, and clearings of ditches, also formed materials for the purpose. By allowing these to lie in heaps for 6 months, of from 3 to 4 ft. in depth, food was prepared for plants. The mass was usually applied to the turnip crop, and when artificial manures were unknown, considerable benefit arose from such dressings. The use of guano and other light manures has superseded in a great measure the necessity of this laborious process, and C. for the

turnips or barley crops are now little used. The wonderful effects that have resulted from the application of small doses of nitrogen and phosphoric acid, have impressed farmers in general with the truth, that the most energetic elements bear a small proportion in weight to the whole mass of farm-yard dung or C., and that the mixing of manures in heaps with earth does not so much add to its virtues as to repay the labor expended in the process. More care is now rightly bestowed in preserving manure from washings by rain. C. formed of leaves, ditch-scourings, road-scrapings, or any earthy matter containing a large percentage of vegetable matter, with the addition of lime, may still be used with benefit for pastures that are deteriorating, or where the soil is stiff. Where moss prevails, lime should enter largely as a component. On the other hand, where the soil is of a strong and clayey nature, earthy substances containing vegetable matter in larger proportions should be used. Vegetable matter has the effect of imparting a softness to the surface, that is particularly conducive to the free growth of pastures. Compost made of turf, leaves, earth, and bone-dust is used with great benefit by gardeners for vines and fruit trees which are injured by too concentrated manures.

COMPOUND ANIMALS are those animals, exclusively of the lowest classes, in which individuals distinct as to many of the powers of life, are yet united in some part of their frame, so as to form one living system. Examples of this union are found in many animalcules and zoophytes, also in cestoid worms and ascidian mollusks. The whole living system in all C. A. appears to originate from a single egg or germ, and each is at first simple; the subsequent multiplication of individuals, having distinct organs, but permanently retaining their connection with the system, has some analogies with some of the modes of true reproduction. It is important, also, to observe that many C. A. exhibit very close relations to other animals which in no degree possess this remarkable character. The subject of C. A. is in many respects an extremely interesting one. This occasional peculiarity in animal life may perhaps be regarded as affording some countenance to the theory of Darwin concerning plants, that each bud is to be accounted a distinct individual. But the term individual must be modified in its sense, when applied to the buds of a tree, or the polypes of a polypidom.

COMPOUND COMMON TIME, that species of measure containing the value of two dotted minims in a bar, or two dotted crotchets, marked thus:



COMPOUND FRACTURE, is such a breaking or contusion, that the air may pass through lacerated flesh and skin to the bone. Such fractures are very difficult to treat with success.

COMPOUNDING OF FELONY, in England, is the offense of taking value for forbearing to prosecute a felony, and is punishable with fine and imprisonment. Compounding of informations upon penal statutes, and compounding of misdemeanors, are also illegal, unless with leave of one of the courts at Westminster, and are punishable in a lighter degree. But in misdemeanors affecting many private (and not public) rights, the court will often permit the defendant to make the prosecutor some pecuniary amends, and thereupon withdraw the prosecution. A species of C. of F. is the advertising a reward for stolen property, coupled with words implying that no questions will be asked, or that no prosecution will be instituted, or that a pawnbroker returning the property will be paid what he has advanced for it; and this offense, by 24 and 25 Vict. c. 96, s. 102, is punishable by a fine of £50, on the advertiser, publisher, and printer. And whosoever shall take money or reward for restoring a stolen dog is liable, by 24 and 25 Vict. c. 96, s. 20, to imprisonment for eighteen months.

COMPOUNDING OF FELONY (*ante*), in the United States, is treated much the same as in England. It is punishable by fine and imprisonment. The accepting of a promissory note signed by a party guilty of larceny, as a consideration for not prosecuting, is enough to constitute the offense; but the mere retaking of stolen goods by the owner is not an offense, unless the thief is not to be prosecuted. A receipt in full of all demands, given in consideration of stopping a criminal prosecution, is void.

COMPOUND INTEREST. See INTEREST.

COMPOUND TRIPLE TIME denotes a measure of nine crotchets or quavers in a bar, and is marked thus: 

COMPRESSED-AIR BATH, a large chamber in which patients sit under increased atmospheric pressure for a greater or shorter period. An attempt at this kind of treatment was made as early as 1662, by Dr. Henshaw, but failed owing to the imperfection of the apparatus. The apparatus, as now used, is the invention of M. Emile Laburié, of Paris, who in 1832 conducted a series of careful experiments upon the effects of the atmospheric air at different densities upon the human frame. The bath is a chamber 9 ft. in diameter and 12 ft. high; it is constructed of iron plates riveted together like those of a

boiler of a steam-engine, so as to be perfectly air-tight; it is provided with two close-fitting iron doors, which can be opened without affecting the pressure of the air within the chamber; the interior is lined with wood, and furnished with seats; a steam-engine of seven-horse power works a pair of large air-pumps, communicating indirectly with the chamber by a pipe that opens by means of numerous small holes in the bottom of the floor, so that the air enters imperceptibly into the chamber; from the roof, a pipe similarly arranged allows the breathed air to escape. Each of these tubes is supplied with a screw valve, by means of which the inlet and exit of the air are regulated. Two barometers hang on the walls of the chamber, to show the rate of increase and decrease of pressure. The pressure is raised at the rate of 1 lb. every 4 minutes, and the lowering takes place at the same rate. The pressure is usually raised to 7 lbs. per sq. inch, in addition to the usual pressure of the atmosphere. The period generally prescribed for remaining in the bath is 2 hours.

The diseases in which the compressed-air bath is said to be most efficient are phthisis, asthma, and chronic bronchitis. The effects are attributed to two causes: 1. A greater quantity of air, and consequently of oxygen, is inhaled in a given time; and not only so, but the amount absorbed is increased in proportion to the pressure of the gas against the walls of the air-vesicles. The increased absorption of oxygen and excretion of carbonic acid enables the lungs to perform their functions more efficiently, and thereby removes any congestion existing in these organs. 2. The increased mechanical pressure of the air upon the mucous membranes, when in a state of chronic congestion, has a bracing effect, and imparts renewed vigor to the entire structure of the lungs and bronchi. At Ben-Rhydding, the compressed-air bath is used in cases of the kind above named, along with the usual appliances of the water-cure.

COMPRESSED-AIR ENGINE. One mode of employing air as a motive-power is described in caloric engine (q.v.). Another obvious way is to compress it, and then apply it in the manner of high-pressure steam. Although compressed air has been used for working small engines in confined situations, such as tunnels (q.v.), it is not at all likely that it will ever come into extensive use, owing to the great waste of power attending it. This waste arises from two causes—first, the friction due to forcing the compressed air along a great length of pipe; and secondly, the loss from the dissipation of the great heat which results from its compression. If, say, 100 cubic feet of air is compressed into 1 cubic foot, it will become very hot, and although it is very easy to keep in the air, it is impossible to keep in the heat. In spite of every precaution, the heat will find its way through the vessel in which the air is confined, and through the pipes in which it is being transmitted, and this is equivalent to a portion of the air itself leaking out, because when the air is permitted to expand in working the engine, it will not attain the bulk it originally had of 100 cubic feet. The greater the original compression of the air, the higher its temperature will rise; and as this caloric, which cannot be kept from escaping, is practically a part of the bulk of the air, it follows that the loss of power from this cause will increase with the pressure or tension of the air. Even were it possible to prevent the escape of the heat, by covering the vessels and pipes with some non-conducting substance, it would not be practicable to use the hot air in the same way as steam is used, because the lubricating material necessary to keep the piston and slide-valves from "tearing" would be decomposed by the high temperature. In steam-engines, there is always a small quantity of water in the cylinders and slide-valves, arising from the condensation of a portion of the steam, and this suffices to lubricate the piston and valves. It is well known that when steam is *superheated* so highly as to prevent a slight condensation in the cylinder and slide-vales, they are very rapidly destroyed. Air rises in temperature when very much compressed, and we cannot use it until its temperature falls; and as this involves a great waste of power, it follows that where economy is of any consequence, air cannot be used as a mode of transmitting mechanical power. Indeed, no fluid can be economically used for transmitting power for any great distance. We have just seen that compressed air is very unsuitable; steam is even more wasteful, because it condenses into water in long pipes. Water itself loses much of its force from friction in passing through long pipes, unless they are of very large size; and in applying it to hydraulic cranes, where the weight to be raised varies, great waste of power arises from the fact, that the cylinder, in which the ram works, has to be filled every time the crane is worked with water at the full pressure of 600 or 700 lbs. to the square inch, even when a pressure one tenth of that amount would suffice to raise the weight. In short, the power actually used in working a hydraulic crane is always the maximum, even when the weight to be raised is a minimum. It *uses* as much power to lift a hundred-weight as it does to lift a ton. The extreme handiness and other practical advantages possessed by the hydraulic cranes leave a large balance in their favor, notwithstanding their waste of power.

In boring the Mont Cenis tunnel (see TUNNEL), air was compressed at the mouth of the tunnel by the abundant water-power easily obtainable there, and forced along to the working face through small iron pipes, for working the boring-machines. The tunnel through the Hoosac mountain in Massachusetts has also been bored by compressed air working the rock-drills. A plan has been proposed for using ordinary steam-boilers and engines close to the working face in the tunnel, and drawing out the smoke and vitiated

air through a wooden trunk. Another fairly successful application of compressed-air engines has been in the working of coal-cutting machines. Of these machines, Firth's in England, Gladhill's in Scotland, and Brown's in America, have been in practical operation for several years; but they can as yet only be economically worked under exceptionally favorable circumstances. Experiments have been recently tried to propel tramway cars with compressed air. Engines for the compression of air are used in making ice. See REFRIGERATING MACHINES.

COMPRESSIBILITY is that property of bodies by which they admit of being forced or pressed into less space than they formerly occupied. The particles composing bodies are in all cases at greater or less distances from one another; and whatever brings the particles closer together, diminishes the volume or bulk of the body. This may be effected by various agencies, as, e.g., by the withdrawal of heat (q.v.); but the effect is called compression only when it is caused by mechanical force, as by pressure or percussion. All bodies are compressible, but in different degrees. Many solids, especially those of a compact structure, have this property only in a slight degree. It was believed at one time that liquids were incompressible; more accurate experiments, however, have proved that this is not the case; water, for instance, subjected to a pressure of 15,000 lbs. on the sq.in., loses $\frac{1}{20}$ of its volume. Gases, on the other hand, are strikingly compressible; by means of a common condensing syringe, a number of cubic inches of air can be forced into the space of one inch. Compression is in almost every instance accompanied by an evolution of heat. When a piston, having a piece of German tinder attached to the bottom, is forced rapidly to the bottom of a shut condensing syringe, and rapidly withdrawn, the tinder is found ignited.

In a restricted sense, those gases are said to be compressible which, under great pressure, become liquid. This is the case with carbonic-acid gas, chlorine, sulphurous-acid gas, and others. Atmospheric air and its components have hitherto resisted all attempts to liquefy them; though it is believed that only a sufficient degree of pressure and cold is necessary to make any gas liquid. Carbonic-acid and some other gases are liquefied in small quantities by inclosing the ingredients necessary for generating the gas in a strong glass tube, keeping them separate till the tube is hermetically sealed. The gas, as it is produced, is condensed into a fluid by its own pressure, which is aided by keeping one end of the bent tube in a cooling mixture.

COMPROMISE MEASURES, or OMNIBUS BILL, the popular name of a series of measures submitted to the U. S. senate in Jan., 1850, by Henry Clay, having for their object "an amicable arrangement of all questions in controversy between the free and the slave states growing out of the subject of slavery." These questions, which had perplexed the national government from the beginning, and which, since 1830, had caused a wide agitation among the people, were complicated by the war with Mexico, which led to the acquisition of much new territory, the status of which in respect to slavery remained to be determined. At the north it was insisted that the territory in question was *ipso facto* exempt from slavery, and that it was the right and duty of congress to protect it from the blight of an institution whose nature was at war with republican government. The slaves states, on the other hand, were ambitious to establish slavery on at least a part of this territory, and insisted that the national government had no power under the constitution to set up any legislative barriers against the system. The controversy was thought by many to menace the safety of the union, and Henry Clay, on whom had been bestowed the *soubriquet* of "the compromiser" for his previous efforts to stop the agitation of the slavery question, proposed in the senate a series of measures for the purpose of making "a final settlement" of all the questions arising from this subject and bringing the people of the two sections of the country into perfect harmony. When congress met in Dec., 1849, the country was profoundly agitated. President Taylor at an early day transmitted a special message, recommending in substance that California, a part of the newly acquired territory, should be promptly admitted with the anti-slavery constitution which her people had framed and the boundaries which they had designated, and that the other territories should be left under the military government which had been established upon their conquest until such time as they should be entitled to and desirous of admission into the union as states, when they should be received with whatever republican institutions they might present. This plan made no provision for the settlement of the boundary of Texas, which state claimed to include within its rightful jurisdiction most of the people of New Mexico with their entire territory e. of the Rio Grande. To this assumption the people of New Mexico manifested the most determined and active hostility. Mr. Clay at an early day made a speech in the senate concurring in gen. Taylor's preference that each subject should be considered and decided by itself, but insisting that the territory should be promptly organized under regular territorial government, and the Texas boundary settled. In the progress of the discussion Mr. Clay waived his own preference of separate action upon the several questions, and assented to the combination of the admission of California, the organization of the territories, and the adjustment of the Texas boundary, all in one bill, which thence obtained the nickname of the "omnibus bill." A grand committee of 13 was raised, with Mr. Clay at its head, from which committee the "omnibus" was fully reported. It was contested by a good share of the

strength and much of the weakness of the senate. When the struggle was at the fiercest, gen. Taylor died, and it was supposed that his decease and the succession of vice-president Fillmore, who was esteemed moderately favorable to the omnibus bill, would secure its passage; but that expectation was not realized. On the contrary, after various amendments had been proposed, and most of them rejected, though some of considerable importance were adopted, a motion to strike out all that part relating to the boundary of Texas was carried, and the bill thus crippled was dismembered limb by limb, until nothing remained but the section organizing Utah as a separate territory. The famous omnibus bill, reduced to this one item, was passed and sent to the house. However, the California admission, the New Mexican territorial and Texas boundary section, and a new statute for the rendition of fugitive slaves, all passed as separate measures. Their effect, however, was not to suppress but rather to intensify the anti-slavery agitation, which waxed hotter and hotter, until it was finally suppressed only by the destruction of slavery itself.

COMPTON, a co. in the province of Quebec, Canada, on the New England border, drained by the St. Francis, Chaudiere, and Salmon rivers; pop. '71, 13 665. The Atlantic and St. Lawrence railroad crosses the s.w. section. Capital, Cooksville.

COMPTON, HENRY, 1632–1713; bishop of Oxford and afterwards of London. He was the tutor of James II., who, through his teachings, became attached to the Protestant faith. James deposed Compton, but when invasion was threatened he reinstated him; but Compton adhered to the Protestant side, and when William was proclaimed, crowned him with his own hands.

COMPULSION. Acts done or grants made under the influence of C.—i.e., either force or fear—are reducible by the law of Scotland. But the fear must be such as would shake a man of ordinary firmness and resolution. In like manner, the plea of *vis major* —that is, that the individual acted under the influence of power greater than his own—may relevantly be set up as a defense against such offenses as rebellion, piracy, etc. See DURESS.

COMPURGA'TORS were twelve persons whom the law of our Saxon ancestors permitted the accused to call in proof of his innocency, and who joined their oaths to his. They were persons taken from the neighborhood, or otherwise known to the accused. It was rather in the character of jurymen than of witnesses that the C. acted, for what they swore to was not their knowledge, but their belief, and the institution belonged to a time when what has since been spoken of as the Saxon jury was taken from the persons in the neighborhood best acquainted with the matter to be investigated, and when they performed the combined functions of jurors, witnesses, and judges. The system of C. was adopted even in civil actions for debts, and the ceremony of what was called canonical purgation of clerks-convict, was not abolished in England till 18 Eliz. c. 7.

COMPUTATION OF TIME. See DAY.

COM'RIE, a village and parish in the middle of Perthshire, on the Earn, a little e. of Loch Earn, and 20 m. w. of Perth. It lies amid the very picturesque scenery of the clay-slate band of Scotland, and is noted for frequent slight shocks of earthquakes. It has woolen and cotton weaving, and distilleries. Pop. '71, 1911.

COMSTOCK, CYRUS B., b. Mass., 1831; a graduate of West Point, major of engineers, largely employed in engineering works during the war of the rebellion. In 1871, he was made superintendent of the geodetic survey of the northern lakes.

COMSTOCK, JOHN LEE, 1789–1858; b. Conn.; a physician in Hartford. He is widely known as the author of text-books for schools, the one on philosophy having had a sale of more than a million copies.

COMTE, AUGUSTE, the founder of the positive philosophy, was b. at Montpellier in 1795 or 1797. He studied at Paris; and at an early period, it is said, attracted the attention of his companions by the boldness and novelty of his speculations, maintaining that the time was come when philosophy must undergo another great change, such as it had done in the days of Bacon. G. H. Lewes, who regarded C. as the Bacon of the 19th c., only much greater, informs us that C. was but *fourteen* when "the reforming spirit awoke" in him (see *Exposition of the Principles of the Positive Philosophy*, by G. H. Lewes, Bohn, London, 1853). Shortly after this, and while still laboring under the excitement of his new convictions, he became acquainted with St. Simon; entered enthusiastically into his theories, which had not a little in common with his own, and which possessed in addition this advantage, that they were the results of matured thinking (St. Simon being then between 50 and 60); and in 1820, was appointed by the master himself to prepare an exposition of the *Politique Positive* of the St. Simonian society. The work did not satisfy St. Simon, who deplored the absence of the "religious and sentimental aspects" of his system. In 1825, on the death of St. Simon, C. broke off altogether from his *confrères*, and in after-years, was accustomed to speak slightingly of his old master's abilities. In 1826, C. was attacked by a cerebral disorder, brought on by "overwork and heart-anxieties." He recovered, however, and in 1832,

was appointed professor of mathematics at the *Ecole Polytechnique*, which situation he was forced to resign in 1852, on account of differences with his colleagues. He died at Paris, Sept., 1857.

C.'s works are *Cours de Philosophie Positive* (6 vols., Par. 1830–42; freely translated into English and condensed by Harriet Martineau, 2 vols., 1853); *Traité Elémentaire de Géométrie Analytique* (1843); *Traité d'Astronomie Populaire* (1845); *Discours sur l'Ensemble du Positivisme* (1848); *Système de Politique Positive* (4 vols., 1851–54; Eng. trans., 1875, *et seq.*, Longmans); and *Catéchisme Positiviste, ou Sommaire Exposition de la Religion Universelle* (1 vol., Par. 1852). It is impossible here to do more than state, in the briefest way, C.'s central and governing doctrine. It is this: The race (like the individual) necessarily passes through three intellectual stages—1. The *theological*, in which a supernatural origin is sought for all phenomena, and the *Deus ex machinâ* is the only explanation of events; 2. The *metaphysical*, in which the *sensuously* supernatural is set aside as incredible, and an effort is made to demonstrate the existence of "abstract forces or entities supposed to inhere in various substances, and capable of engendering phenomena;" 3. The *positive*, in which the mind affirms the futility both of theological and metaphysical inquiries, abandons all vain search after the *causes* and *essences* of things, "restricts itself to the observation and classification of phenomena, and to the discovery of the invariable relations of succession and similitude which things bear to each other; in a word, to the discovery of the *laws* of phenomena." This last is the stage at which C. conceives Europe to have arrived. Theology and metaphysics are alleged to be in their dotage, and all the anarchy of modern life to arise from the presence of these disturbing elements. To deliver us from their hurtful influence, C. employs the principles of positivism to organize a new social doctrine, which shall embrace the entire wants of man as an intellectual and emotional being. C. thus aims at being not only the founder of a new philosophy, but also of a new religion, and has even assumed the title of *Fondateur de la Religion de l'Humanité*. His views, which are very original and comprehensive, have excited much attention among thinkers in France, England, and Germany, and obtained not a few ardent adherents.

CO'MUS, in the later mythology of the Greeks, the god of mirth. In classic mythology, the personification does not exist; but in the works of Philostratus, a writer of the 3d c. A.D., C. appears as a winged youth slumbering in a standing attitude, his legs crossed, his countenance flushed with wine, his head (which is sunk upon his breast) crowned with dewy flowers, his left hand feebly grasping a hunting spear, his right an inverted torch. Born from the loves of Bacchus and Circe, C. is "much like his father, but his mother more;" a sorcerer, like her, who gives to travelers a magic draught that changes the human face into the "brutal form of some wild beast," and, hiding from them their own foul disfigurement, makes them forget all the purities of life "to roll with pleasure in a sensual sty."

CON, or COL, an Italian particle, meaning "with," much used in musical terms, as "con spirito," "con brio."

CO'NANT, HANNAH CHAPLIN, 1809–65; daughter of Jeremiah Chaplin, president of Waterville college, and wife of Thomas Jefferson Conant, D.D. In 1838, she was the editor of *The Mother's Journal*, and before and afterwards a contributor to current literature. She was thoroughly versed in the German language, and assisted her husband in translations and other literary work. Her principal work is *The English Bible, a History of the Translation of the Holy Scriptures into the English Tongue*. She wrote, also, *The Earnest Man*, an excellent biography of the missionary Judson.

CO'NANT, THOMAS JEFFERSON, D.D.; b. Vt., 1802; a graduate of Middlebury college in 1823, studied philology in New York, and was professor of languages in Waterville college (now Colby university). He resigned in 1833, to devote his time to the study of eastern languages, and in 1835 he was appointed professor of Biblical literature and criticism in the Baptist theological seminary at Hamilton, N. Y. This position he held for 15 years, two of which were passed in Europe. He translated Gesenius's Hebrew grammar, with the additions of Roediger, a work which became a standard text-book in the United States and England. After holding the professorship of Biblical literature in the university of Rochester for several years, he settled in Brooklyn in 1857, where he now resides, devoting himself for a long time to Bible revision for the American Bible Union. His work has been chiefly with the books of Job, Matthew, Genesis, Psalms, and Proverbs. He also published (in 1860) a treatise on the term *Baptism*, in the New Testament, which attracted much attention. He has been for a number of years one of the American contingents of the Canterbury (England) committee on the complete revision of the authorized version of the Bible.

CONCAN, a territory in the presidency of Bombay, lies between the Arabian sea and the watershed of the western Ghauts, in lat. 15° 44′ to 20° 22′ n., and long. 72° 52′ to 73° 45′ east. Its length is 330 m., and it varies in breadth from 25 to 50 miles. The more easterly section appears to be a succession of rocky terraces, of apparently volcanic origin. The maritime portion averaging an elevation of 100 ft. above the sea,

rises here and there to far greater heights, partly in isolated hills, and partly in short ranges. The broad estuaries into which the rivers expand were formerly the retreats of pirates. Of the land that is available for cultivation, the larger part is found on the banks of the rivers—the growth of rice in particular being promoted by annual inundations. The chief peculiarity of the climate is, that the s.w. monsoon, arrested in its career by the lofty barrier on the e., has been known to yield, in one year, a rain-fall of nearly 300 inches. To omit the city of Bombay, as not being on the mainland, the principal towns are Junera, Ratnagheriah, Viziadroog, and Vingorla. It was in 1818, on the fall of the peishwa of the Mahrattas, that C. became British territory.

CONCAVE. A surface is said to be C. when lines drawn from point to point in it fall between the surface and the spectator, and convex when the surface comes between him and such lines. The terms, it is obvious, are mere terms of relation. See LENS and MIRROR.

CONCEALMENT, in criminal law. The C. of an offender, after the commission of the crime, with the view of shielding him from justice, is an offense which may be punished arbitrarily; but C., in consequence of an agreement before the crime was committed, involves the concealer in a charge of art and part in the principal crime (Hume, 274, 281).

CONCEALMENT OF PREGNANCY AND BIRTH. See PREGNANCY, CONCEALMENT OF; INFANTICIDE.

CONCEITS, from the Italian *concetti*, and meaning ingenious thoughts or curious and pleasant terms of expression in literary composition. These quaint and often absurd conceits greatly marred the literary work of many writers in the 16th and 17th centuries in Italy and France, and they made some progress in England, as may be seen in Cowley's and Donne's verses.

CONCENTAINA, a town of Valencia, Spain, picturesquely situated on a slope of the Sierra Mariola, 27 m. n. of Alicante. It is surrounded by old walls, flanked with towers; has some interesting old buildings; and manufactures of linen, woolen, paper, soap, etc. The fair annually held here is one of the largest in Spain. Pop. 6,100.

CONCENTRIC. Circles are C. when they have the same center, but radii of different lengths.

CONCEPCION. 1. A city near the mouth of the Biobio, the principal river of the republic of Chili, in lat. 36° 50′ s., and long. 73° 5′ west. In 1835, the place was almost destroyed by an earthquake, the cathedral and most of the other public buildings having been thrown down. The city is nevertheless one of the most regular and handsome in the republic, and numbers (1875) 18,277 inhabitants. The cathedral and several of the other public buildings are noteworthy. The industry of the place is chiefly in the hands of foreigners, especially Germans. The discovery in 1852 of coal fields a little to the s. of C., has done much to forward the prosperity of the city. Talcahuano, the port of C., is the safest and best harbor in all Chili, and ranks next to Valparaiso as a mart of foreign trade. Hides and tallow are exported.—2. The bay of the Pacific ocean which forms the harbor of the city above mentioned. It affords good anchorage, communicating with the interior by means of the Biobio, and being sheltered from the open sea by the island of Quiriquino.—3. The province of which the city above mentioned is the capital. Occupying the entire breadth between the Andes and the coast, it is bounded on the s. by independent Araucania, and contains 3,850 sq. miles. In 1875, the population amounted to 151,365.

CONCEPTION, in psychology. See IDEA.

CONCEPTION, IMMACULATE. See IMMACULATE CONCEPTION.

CONCEPTION OF OUR LADY, an order of nuns, founded in 1484, in honor of the immaculate conception, by Beatrix de Sylva, sister of James, first count of Poralegro, in Portugal. It was confirmed in 1489 by pope Innocent VIII., who granted the sisterhood permission to follow the rule of the Cistercians; but after the death of the foundress in 1489, cardinal Ximenes put the nuns under the direction of the Franciscans, and imposed on them the rule of St. Clara. The order subsequently spread into Italy and France. Besides the grand office of the Franciscans, the nuns recite on Sundays and holidays a lesser office, called the office of the conception of the Holy Virgin. Their dress consists of a white gown, a blue mantle, and a scapulary, on which is worn the image of the Virgin.

CONCEP'TUALISM, the name given to a philosophical theory which is, in some sense, intermediate between "realism" and "nominalism." Realists assert that the general notions of the mind are the substance of things; that "ideas" answer not only to the reality of objects, but contain their soul and life. Nominalists maintain that general notions are mere abstractions, inventions of the brain, not expressing the real substance of things. Conceptualists, striving to find a position between the two, teach that the mind has the power of forming for itself general conceptions of single objects. Aris-

totle taught that, although we cannot prove the correspondence of general conceptions with the reality, we are always compelled to take them for indispensable forms of thinking, if we will think at all. Consequently, some have been unable to satisfy themselves whether they were realists, nominalists, or conceptualists.

CONCERT, a musical entertainment of concerted pieces, symphonies, etc., sometimes interspersed with songs, performed by an orchestra of many instruments. C. performances are now established in almost every city in Europe, and societies are formed to foster and encourage the art. Among the oldest institutions of this kind are the Gewandhaus concerts in Leipsic, established in 1742; and the concerts spirituels in Paris, established in 1725. Of more recent institution are the concerts of the Philharmonic society in London, of the Conservatoire in Paris, and the Symphonic concerts in Berlin, etc.

CONCERTI'NA, a musical instrument of modern invention, the sounds of which are produced by free vibrating springs of metal, as in the accordion. The scale of the C. is very complete and extensive, beginning with the lowest note of the violin, G, and ascending chromatically for three and a half octaves to C. Violin music can be performed on the C. with good effect. Every sound in the scale is double, and can be produced either by pulling the bellows open, or by pressing them together. Wheatstone of London is the inventor. Concertinas are now made in France and Germany, but not so perfectly as in England.

CONCER'TO, a musical composition for a solo instrument, with orchestral accompaniments, calculated to give the performer an opportunity to display the highest mechanical skill, as well as intellectual cultivation in the art. The C. consists of three movements, each of which, like the whole, has a certain character, and like the symphony or the sonata, requires a clear development and treatment of the motives, and a strict adherence to the rules of form. When the form is in any way abridged, it is then called a concertino. From the beginning of the last century to the present time, the pianoforte and the violin are the solo instruments mostly used for the concerto. The oldest violin concertos are those by Tartini and his scholars. The French and Germans afterwards improved on these, and fixed the forms, which all the great masters of modern times have adhered to. Innumerable concertos have been written for the pianoforte, amongst which compositions of the most masterly kind are to be found. Concertos for wind instruments have been less regarded, and are generally written by the performers themselves, and seldom deserve to be called classical works.

CONCH, the name of many univalve shells, which are sometimes used as dinner horns, having almost the sonorous quality of a trumpet. In some of the Pacific islands the shell is used as a musical instrument. The heaps found in various places on the Atlantic coast of the United States indicate that the Indians used for food the tough clam-like creature inclosed in the shell.

CON'CHA, José de la, b. 1800; a Spanish statesman, a native of Buenos Ayres. In South America he fought against the revolutionists, and against Don Carlos in Spain, where he found rapid promotion. In 1849, he was made captain-general of Cuba, where he brought about many reforms. He was removed in 1851, again appointed in 1854, and again recalled in 1856. He was senator, ambassador to France, and a member of the cabinet. In 1868, Isabella made him prime-minister, and when her cause was lost he followed her into exile.

CON'CHA, Manuel de la, Marquis of Douro, b. 1794; brother of José. He served against Napoleon, against the North American revolutionists, and against Don Carlos; and supported Maria Christina, Isabella, and the administrations of Espartero and Narvaez. He escorted Maria Christina to Paris, and was afterwards one of the prominent ultra-conservatives in the Spanish legislature. He suffered banishment and endured promotion with subsequent changes of government. His work on infantry and cavalry tactics is a text-book in Spain.

CONCHIF'ERA (Lat. shell-bearing), in Lamarck's arrangement of mollusks, a class containing those which have bivalve shells; *lamellibranchiata* (q.v.) and *brachiopoda* (q.v.). The term is still sometimes used.

CON'CHO, a co. in w. Texas, on the Colorado, intersected by the Concha river and other streams; 1025 sq.m.; no population. It has a broken and rocky surface, with little timber. Pop. '80, 800—17 colored.

CON'CHOID OF NICOME'DES, a curve invented by Nicomedes, with the view of trisecting an angle, of constructing two geometrical means between two given straight lines, and of "doubling the cube." It is generated as follows: Draw a straight line which will be the directrix of the curve, take any point without the directrix as the pole, and draw a number of straight lines from it intersecting the directrix. Lay off distances on the intersecting lines each side of the directrix equal to a given line (the modulus): the curve traced through the points above the directrix will form the first or superior conchoid, and the curve traced below will form the second or inferior conchoid. Both branches are infinite in extent, and the directrix is a common asymptote. If the foot of the perpendicular dropped from the pole to the directrix be taken as the origin, and this distance be called b, and the modulus a, the equation to the C. is $x^2 = \frac{(b+y)^2(a^2-y^2)}{y^2}$. The curve

may easily be described mechanically, and is frequently used in architecture as a bounding line of the vertical section of columns. The name is Greek, and means shell-shaped.

CONCHOL'OGY (Gr. *konchos*, a shell, *logos*, a discourse), the science which treats of shells and of the animals inhabiting them. C., as a science, is at least as old as the days of Aristotle; the study of it was resumed along with that of the other sciences, when the dark ages had passed away; but since the beginning of the present century, it has given place to a more extended and comprehensive study of molluscous animals, now sometimes designated MALACOLOGY; the presence or absence of a shell having been found not to constitute one of the most important characters which distinguish different classes of mollusks. C., indeed, was only the form of the science suited to a time when the shell was more considered than its inhabitant. Yet the relations between shells and the mollusks which possess them are such, that the labors of the merest conchologists have contributed to the real advancement of science, both zoological and geological. It is upon the knowledge of these relations that many of the conclusions of the geologists are founded. In systems of C., shells were usually divided into three orders, *univalves*, *bivalves*, and *multivalves*, according to the number of pieces—one, two, or more—of which they are composed. The first two were established by Aristotle, the third was added in modern times.

CON'CHOS, or CONCHAS, a river in Mexico in the state of Chihuahua, flowing through the rich table land of that region and joining the Rio Grande del Norte, after a course of about 350 miles.

CONCLAMA'TIO, a custom among the ancient Romans something like the "wake" among modern Irish. When Dido burned herself to death, her palace was vocal with the howls of her attendants. Their ululations apparently resembled the wild lament of the Irish over their dead.

CONCLAVE (Lat.), either the place where the cardinals assemble for the choice of a pope, or the assembly itself. The practice of a C. originated at the election of Gregory X. at Viterbo in 1271, and was regulated by the council of Lyons in 1274, with formalities still substantially in force. The C. must consist of a single apartment, having only one door, which is kept securely locked. Food and other necessaries are handed through a window, and are subjected to a rigorous examination, in order to prevent communication with the outer world; the cardinals not being allowed to leave the place, or to receive or send out letters, until a new pope is chosen. As the C. was generally held in the Pauline chapel at Rome, a number of little cells were erected in one of the galleries, each to form the lodgment of a cardinal.

A *conclavist* is a spiritual or secular attendant on the cardinals during the conclave. Each cardinal is allowed three. They are sworn to silence, and are not allowed to leave, except in dangerous illness. This office is of great delicacy and trust; and formerly a sum of 10,000 crowns was divided among the conclavists at each election.

CONCOM'ITANCE, SACRAMENTAL, in the Roman Catholic church, implies that the body and blood of Christ, sacramentally, accompany each other, so that under either form, whether wine or bread, both are sacramentally received.

CONCORD, by English writers on music, is defined as the relation, harmony, or agreement between two or more consonant sounds; such as the union of the major or minor third with the perfect fifth and octave. The German musical technology gives a wider meaning to this term, defining C. as every simultaneous sounding of tones, whether in single intervals or in complete chords, and whether consonant or dissonant.

CONCORD, a t. in Middlesex co., Mass., on the Concord river and the Fitchburg railroad, 20 m. n.w. of Boston; pop. '80, 3,922. It is a very handsome village, in a lovely rural region, having a variety of manufactories. It was in Concord that the provincial congress met in 1774–75, and here, April 19, 1775, a number of men were killed in a skirmish between the people and the English troops. Ralph Waldo Emerson, A. Bronson Alcott, Hawthrone, Thoreau, and other men of literary fame, have been residents of the town, which has gained a repute in America and Europe as one of the centers of philosophic thought.

CONCORD, the capital of New Hampshire, U. S.—called RUMFORD before the American revolution, from which count Rumford took his title—is on the right bank of the Merrimac river, 59 m. n.w. of Boston, lat. 43° 12′ 29″ n., long. 71° 29′ west. C. is a handsome village, extending 2 m. along the river, with state-house, state-prison, state lunatic asylum, city hall, two railway depots, nine churches, four or five newspapers, and manufactures of carriages, iron, steel, machinery, musical instruments, woolens, leather, etc. Pop. '70, 12,241.

CONCORD (*ante*), a city in Merrimac co., N. H., the co. seat, and capital of the state, on Merrimac river, 60 m. n.n.w. of Boston. The river divides the city almost equally from n. to s., and along a part of the n. border winds the Contocook river. At the junction of the two streams there is an island historically famous as the place where, in 1697, Mrs. Hannah Dustin, aided by a boy and her nurse, slew ten Indians who had made the women and boy captives at Haverhill, Mass. The site of C. was the seat of the Pennacooks, formerly a powerful Indian tribe. The city, settled 1725, incorporated

1853, is well laid out, and the streets are finely shaded with maples and elms. Four or five railroads center here, connecting with all points in New England and Canada. In 1810, the pop. was 2,398; in 1880, it was 13,833. One of the principal buildings is the state-house, built of granite by the labor of state-prison convicts. It is in a fine park near the center of the city. Half a mile away stands the state asylum for the insane, a large brick building, with which is connected a fine farm. The city is supplied with water from works built in 1872. Not far away are extensive quarries of fine-grained white granite, of which large quantities are sent to other cities. There is an abundance of water-power furnished by the rivers and small streams near the city. The manufacture of carriages is one of the leading industries. There are nearly 150 manufactories in this and other branches of business. The libraries and schools of the city are ample and of the most advanced order. There are about 20 churches, and seven or eight newspapers.

CONCOR'DANCE, a book arranged in alphabetical order, and showing in how many passages all, or at least all the more important words in any work occur. For writings of universal import, from which passages are continually being adduced to prove or support principles affecting our daily life and action, such a hand-book is indispensable. The necessity of a C. for the Bible seems to have been felt at an early period. The first was executed by Antonius of Padua (b. 1195, d. 1231), who published it under the title *Concordantiæ Morales.* He was followed by Hugo de St. Caro (1244) and others, all of whom based their labors on the Latin Vulgate. A Greek C. by Euthalios of Rhodes was prepared about the year 1300, but has been lost. The Alexandrine C. of the Old Testament was compiled by Conrad Kircher in the 16th c., and Xistus Vetuleius published in 1546 a C. of the Greek New Testament, which was republished and amended by Stephens in 1600. In Hebrew, a C. was drawn up by rabbi Isaac Nathan, in 1438, amended by Marius of Calassio (Rome, 1620), by John Buxtorf (1632), and by Fürst (Leip. 1837–41). The chief concordances for Luther's translation of the Bible are those of Lankisch, Büchner, Wichmann, and Schott. For the authorized English version of the Bible, the best C. was compiled by Alexander Cruden, and first published in 1737. Among the best editions of this work we may mention those bearing the dates 1810 and 1824. The C. of Parallels, by Crutwell (1790), is esteemed a valuable work. Among secular works of this kind, the *Complete Concordance to Shakespeare,* compiled by Mrs. Cowden Clarke (Lond. 1845), is one of the most remarkable.

CONCOR'DAT (Lat. *concordatum,* "a thing agreed on"), although sometimes used of purely secular treaties, is now almost exclusively employed to designate a compact on ecclesiastical affairs between the pope, as head of the Roman Catholic church, and the temporal ruler of a particular kingdom or state. Concordats commonly relate to things which are neither purely spiritual, as faith, the sacraments, or worship, nor purely temporal, as civil rights, taxation, etc., but mixed matters, regarding which each power makes certain claims, in regard of which the action of the two powers can with difficulty be dissociated; and in which, therefore, in the hope of harmonious co-operation for the public good, each is willing to cede to the other a portion of its peculiar right. Concordats are of two kinds—the first in the form of a treaty, to which both the contracting powers are formally consenting parties; the second, in which the terms are concerted by both, or, at least, are mutually accepted, but are published only by one, most commonly by the pope, in the form of a bull, reciting the enactments which result from the agreement. This difference is only in form. In both it is a settled doctrine of Roman Catholic canonists, and especially of those of the Ultramontane (q.v.) school, that the pope never absolutely cedes purely spiritual powers. Thus, in the presentation to bishoprics, while the king "nominated" or "elected," the pope always reserved to himself the power of "canonical institution."

We shall briefly enumerate the most important concordats. (1.) *Concordats with Germany.*—The earliest subject of negotiation between church and state in Germany was the mode of electing the popes, to which subject may be referred the compact of Otho I. with John XII., and the constitution of Leo. VIII.; but the well-known concordat of Worms in 1123, regarding investitures, is commonly regarded as the first concordat strictly so called. Similar agreements took place on the question of the *Regalia* (q.v.), between the Roman see and the emperors Otho IV., Frederic II., and Rudolph of Hapsburg. A more comprehensive compact on church matters is that of which the foundation was laid at Constance in 1418, and which was subsequently modified, by the "Frankfort" or "Princes' Concordat," by the concordat of Aschaffenburg, and by that of Vienna; which last, although practically disregarded by Joseph II. and Leopold, continued in use till the suppression of the emperor of Germany in 1803. Its place was supplied, under Pius VII. and his immediate successors, by separate concordats with Bavaria, 1817; Prussia, 1821; Baden, Würtemberg, and other minor states, 1818; Hanover, 1824; Saxony, 1827; and the Netherlands in the same year. The last German concordat was that concluded at Vienna, Aug. 18, 1855. The chief articles were that the pope should have direct communication with the bishops, clergy, and people, and archbishops and bishops with their clergy and their flocks, and the right to govern their sees according to the canonical law. Education was placed entirely under the control of the church. The bishops were to settle what books should be used. The chief inspector of schools was to be chosen by the emperor from among the individuals

selected by the bishops. The government bound itself to prevent the dissemination of books pointed out as dangerous to religion by the bishops or archbishops. All questions of marriage, except in so far as they might involve civil consequences, were reserved exclusively to the ecclesiastical courts. Priests guilty of crimes were to be tried in the temporal courts; but the bishop was to be duly notified of the fact, and convicted priests were to be imprisoned apart in a monastery or other ecclesiastical building. The emperor was to choose bishops, but with the advice of the existing bishops and archbishops. The church might acquire new property, but once acquired, it could not be sold or mortgaged without the consent of both pope and emperor. This concordat was set aside in 1868 in all the dominions of the emperor of Austria. (2.) *With France.*—The pragmatic sanction, ascribed to St. Louis, but really of later date, has some of the characteristics of a concordat; but the first proper concordat is that of Francis I. with Leo X. in 1515 and 1516, which continued in force, although with more than one conflict of the two powers, till the revolution. In re-establishing the church in France, Napoleon Bonaparte, as first consul, concluded with Pius VII., through the agency of cardinal Consalvi, the celebrated concordat of 1801; which he afterwards compelled the pope, then a captive at Fontainebleau, to modify by a new act in 1814. Both were ignored at the restoration; but an attempt to produce a substitute in 1817, and again in 1819, led to no practical change. (3.) *With Italy.*—In Italy, an agreement regulating the election of bishops was concluded with Nice and Savoy by Nicholas V. in 1451; and a formal concordat was made with Sardinia by Benedict XIV. in 1740. The ecclesiastical affairs of Naples were anciently regulated by the terms of what was called the *Monarchia Sicula;* but a formal concordat was concluded with Charles III. by the same pope in 1741, and a new concordat was made by Pius VII. in 1818. (4.) *With Spain.*—Charles V. concluded a concordat for his Spanish kingdom with Adrian VI. and Clement VII.; and a further concordat was made by Clement XII. and Philip V. in 1737. (5.) *With Portugal.*—Benedict XIV. made a concordat with Portugal in 1741.

CONCORD, Book of, a collection of confessions of faith published in 1580, generally accepted by the Lutheran church. Its contents are: 1. The Apostles', the Nicene, and the Anthanasian Creeds; 2. The Augsburg Confession; 3. The Apology of the Confession; 4. The Schmalcald Articles; 5. The Larger and Smaller Catechisms of Luther; 6. The Formula of Concord. The last named division, the Formula of Concord, appeared in 1580, after protracted conferences, and was acceded to by 86 of the states of the empire. Its topics are: The Rule of Faith and the Creed; Original Sin; Free Will; Justification; Good Works; The Law and the Gospel; The Third Use of the Law; The Lord's Supper; The Person of Christ; The Descent of Christ into Hell; The Customs of the Church; Predestination, and Election; and an appendix concerning heresies and sectaries.

CONCOR'DIA, a parish in e. Louisiana, on the Mississippi and Red rivers; 790 sq.m.; pop. '80, 14,914—13,597 colored. The surface is low, and much of the land is subject to inundation. Cotton is the chief production. Seat of justice, Vidalia.

CONCOR'DIA, a Roman divinity, the goddess of concord, in whose honor many temples were built, the oldest of them by Camillus in 367 B.C. In this temple the senate sometimes met. It was restored by Livia, wife of Augustus, and consecrated to Tiberius in 9 A.D. It was burned in Constantine's time, but was again restored. The goddess was represented as a matron, holding in her right hand a saucer-like vessel or an olive branch, and in her left, the horn of plenty. Her symbols were two hands clasped together, and two serpents entwined about a wand.

CONCRETE (Lat. *concrescere,* to grow together) is opposed to abstract (see Abstraction). A concrete notion is the notion of an object as it exists in nature, invested with all its qualities, as any particular flower, leaf, or tree; an abstract notion is the notion of any attribute of that flower, leaf, or tree, such as its color, form, or height; qualities which may be thought of independently of the objects in which they inhere, though they cannot so exist. The abstract method of handling a subject is adapted to speculation and reasoning; the C., to poetic effect and impressive illustration.

CONCRETE, a mixture of hydraulic or other mortar with gravel or shingle, which, on hardening, forms an artificial conglomerate. The best C. is made by well mixing hydraulic mortar (see Cement) with sand and sufficient water for complete hydration, and then adding the shingle or screened ballast, and mixing them well together. An inferior C. may be made by laying the shingle into the foundation or other place where the C. is required, and then pouring mortar upon it, to fill the interstices between the pebbles.

The principal use of C. is to form a basis of artificial stone for buildings that rest upon loose or damp subsoils. Such a basis, if well made, forms a solid foundation-slab upon which the weight of the whole structure is equally distributed. It also resists the capillary ascent of moisture from the soil, which would otherwise take place through brick-work or porous stone. A very extensive and important application of C. in this manner has been made in the lower part of Pimlico and Thames bank. An extensive district that, only a few years since, was a pestiferous marsh, is now covered with high-class houses, and forms one of the fashionable quarters of the w. end of London. The houses, and, in fact, the streets altogether, may be said to rest upon a substratum of

artificial rock formed of C., which, besides giving stability to the buildings, shuts out the exhalations from the soil, and prevents the ascent of the moisture so abundant below.

C. is occasionally used for building walls by ramming it into molds, giving it the form desired. A very beautiful application of C. for making mosaic floors is common in Italy. A stratum of cement is laid, and the surface carefully leveled; then pebbles of variegated colors are sifted over it; before it is quite hardened, these are beaten down, so as to be imbedded in the cement, and form the top layer. When the C. has completely hardened, the rounded surfaces of the pebbles are ground down by means of a large slab of stone, which, together with sharp sand, is rubbed over the surface until it is quite smooth; and thus a variegated pavement is formed by the flattened surfaces of the colored pebbles and the cement between them.

CONCRETION, in medicine, a formation of solid unorganized masses within the body, either by chemical precipitation from the fluids, or by the accidental aggregation of solids introduced into the system from without. In the former case, a C. is termed a calculus (q.v.); in the latter, the C. may be either wholly composed of solids foreign to the body, or these may be mingled with the elements of the secretions, as with mucus, or calculous matter. Thus beans, peas, needles, etc., introduced into the cavities of the body, have become the nuclei of concretions, by attracting around them mucus, or crystalline deposits from the urine. The most remarkable forms of C., however, are perhaps those formed in the stomach and intestines of man and the lower animals, from the more solid and indigestible parts of the food, or of substances improperly swallowed. Thus, young women have been known to acquire the habit of swallowing their own hair to a great extent; and very large concretions have been thus formed, which have proved fatal, by obstructing the passage of food. The use of oatmeal in large amount has also been found to lead to concretions, especially when eaten coarsely ground and unboiled; such concretions have commonly been found in the intestines. The excessive domestic use of magnesia in the solid form as a laxative, has been known to have a similar effect. In certain animals, intestinal concretions are not uncommon, and grow to an immense size; they used to be greatly prized as antidotes, and were used in medicine under the name of bezoars (q.v.). In certain forms of morbid deposits, such as fibrous tumors (see TUMOR), and in tubercle (q.v.), concretions not unfrequently form; they are for the most part composed of phosphate of lime.

CONCRETIONARY STRUCTURE is a condition in rocks produced by molecular aggregation subsequent to the deposition of the strata, whereby the material of the rock is formed into spherules or balls, as in the grains of oolitic limestone, or the larger concretions of magnesian limestone.

CONCUBINAGE. The earliest Roman laws were distinguished for the strictness with which they treated marriage. They not only upheld thoroughly the principle of monogamy, but they fettered marriage itself with many burdensome forms. Hence arose the practice of a free unmarried man entering into a less strict relation with a single woman—a sort of permanent cohabitation. The offspring of such a connection, called natural children, had not the rights of legitimate children, but they were recognized by the father. Augustus, with a view to promote regular marriages and check the growing licentiousness, enacted a comprehensive marriage-law (*Lex Julia et Papia Poppæa*), which still allowed C., but only with women of low rank or who had lost their station. Christianity required the complete sanctity of marriage, although the civil law long continued to tolerate separation at pleasure. In the eastern empire, C. was entirely prohibited by the emperor Leo. The ancient laws of the Germans recognized, along with regular marriage, an informal connection of the sexes. In the middle ages, a similar connection became customary, called a "left-handed," or morganatic marriage (q.v.). The code Napoleon does not allow of C., but the wife can sue for separation only when the husband maintains a mistress in the common dwelling.

CONCURRENT JURISDICTION. Jurisdiction is said to be concurrent, or cumulative, when it may be exercised in the same cause by any one of two or more courts. To prevent the collision which might arise from each of the courts claiming to exercise the right, it has been established as a rule, that the judge who first exercises jurisdiction in the cause acquires a right, *jure præventionis*, to judge in it exclusive of the others. The judge by whose authority an offender is first cited or first apprehended, prevents and so excludes the other from his right of cognizance. "This right of prevention plainly appears to be peculiar to criminal jurisdiction. In civil, it is the private pursuer who has the only right of choosing before which of the courts he shall sue."—Erskine's *Institutes*, b. i. tit. ii. s. 9. Opposed to *concurrent* or *cumulative*, is *privative* jurisdiction. In England, in some cases, there is C. J. between the superior and county courts. "Where the plaintiff dwells more than 20 m. from the defendant; or where the cause of action did not arise wholly, or in some material point, within the jurisdiction of the court, within which the defendant dwells or carries on his business at the time of the action being commenced; or in general where any officer of the county court is a party; in any of these cases, the superior courts have a concurrent jurisdiction."—Stephen's

Com., v. iii. p. 383. By 19 and 20 Vict. c. 108, s. 39, it is provided, that if, in an action or contract, the plaintiff claims more than £20, or, in an action of *tort* (that is, for wrong independent of contract), more than £5, and the defendant gives notice that he objects to the action being tried in the county courts, and gives security for the amount sued for with costs—all proceedings shall be stayed in the county court.—*Ib.* note.

CONCUSSION, in medicine, a sudden impression or shock communicated to the brain or to the whole nervous system, as the result of a severe injury, or collision of the body with some external object, as in a fall, or in the crash of a railway accident. It is usual to distinguish C. from the more mechanical results of injury, by observing its effect upon the circulation and on the general sensibility; and there can be no doubt that the distinction is well-founded, for in the first place death may follow from C. alone, without any appreciable destruction of texture; and 2dly, C. may be followed by recovery within a few hours, leaving the local injury entirely unattended by constitutional disturbance; or recovery may be complete, there having been no local injury at all. Under the immediate shock of injury, the patient is usually unconscious and insensible, pale, cold, sometimes shivering, pulseless, or nearly so, the pupils inclining to contraction rather than dilatation, or in some cases natural; the breathing is irregular, slow, feeble, and sighing; the secretions are suspended; the stomach often yields up its contents; and the bowels and bladder may also be evacuated. This state ends either in death, or in gradual reaction, which may pass over into a state of inflammatory fever, with violently excited circulation, and greatly increased heat of the surface. In the treatment of C., it is sometimes necessary to have recourse to stimulants; but in general, moderate heat applied to the surface, abundant supplies of fresh air, and careful adjustment of the injured parts, are all that is necessary till consciousness is somewhat restored, and the power of swallowing regained; some warm soup should then be given, with a small allowance of wine or other stimulant, proportioned to the age and habits of the individual; and the effect being carefully watched, this treatment may be continued until restoration is complete. If there be danger of failure of the breathing or heart's action, artificial respiration (see RESPIRATION) should be employed without delay; and the patient should be transferred as soon as possible from the place of the accident to a warm and comfortable bed, where the necessary restoratives may be more conveniently used. The connection of the nervous system with the heart, in cases of C., is a very curious subject in physiology, and has been the subject of minute investigations by Bichat, Legallois, Wilson Philip, Marshall Hall, and many others

CONCUSSION FUSE. See FUSE.

CONCUSSION SHELL. See SHELLS.

CONDAMINE, CHARLES MARIE DE LA. See LA CONDAMINE.

CONDÉ, the name of several places in France, the following being the most important:

CONDÉ, in the department of Nord, situated at the confluence of the Haine and Scheldt, about 7 m. n.n.e. of Valenciennes. It has an arsenal and strong fortifications, constructed by Vauban, and was the scene of severe contests in the Napoleonic wars. Here are coal-pits and a great coal depot; and manufactures of starch, chicory, leather, and soap. Pop. '76, 3,382.—CONDÉ-SUR-NOIREAU, a t. in the department of Calvados, at the union of the Durance and the Noireau, 25 m. s.s.w. of Caen. It is an old place, with dark heavy houses. Its manufactures are cotton, cutlery, and leather; and it has a pretty extensive trade in cattle, honey, etc. Pop. '76, 6,835.

CONDÉ, a family celebrated in French history, and which takes its name from the town of Condé (q.v.), in the department of Nord. One Godfrey de C., about the year 1200, was in possession of a part of the barony of Condé. His great-granddaughter, Jeanne of C., married in 1335 Jacques de Bourbon, comte de la Marche, and the barony of C. went to their second son, Louis de Bourbon, comte de Vendôme, whose great-grandson, Louis de Bourbon, prince of C., in virtue of his blood-relationship to the royal family, assumed the title of prince, and is regarded as the founder of the new house of this name.

CONDÉ, HENRI I. DE BOURBON, Prince de, 1552–88; son of Louis. He joined the Huguenots after the death of his father, and escaped death at the massacre of St. Bartholomew only on a promise to renounce Protestantism. Some time afterwards he collected a military force and joined Alençon, the Protestant leader. In 1585, he was excommunicated by the pope. He died from poison, and his wife was suspected of being guilty of his death; but Henry IV. refused to prosecute her, and that led to the suspicion that she had a *liaison* with that monarch.

CONDÉ, LOUIS DE BOURBON, Prince de, was b. 7th May, 1530, and first distinguished himself under marshal Brissac. In the dissensions between the houses of Guise and Bourbon, C. was the soul of his party, which was for the most part Calvinistic or Huguenot. It was he who directed the conspiracy of Amboise, which had for its aim the banishment of the Guises, and the capture of Francis II. On its discovery, he fled to his brother at Nérac, and there projected a plan for securing possession of all the large towns of France, which, however, miscarried, and C. himself was taken prisoner,

and condemned to be executed; from which fate he was luckily saved by the opportune death of the king. On the accession of Charles IX. to the throne, C. obtained his liberty and the governorship of Picardy; but the harsh treatment which the Huguenots in general received, drove him into rebellion; and on the 11th of April, 1562, he commenced a civil war by the capture of Orleans, Rouen, and other places. Defeated and taken prisoner at the battle of Dreux, in the same year, he was employed by the victors in concluding a treaty of peace, which lasted only a short time. C. recommenced hostilities by a daring but unsuccessful attempt to possess himself of the person of his sovereign (28th Sept., 1567). After the battle of St. Denis, 10th Nov., 1567, a second peace was concluded; but having reason to believe that Catharine de' Medici was plotting against his liberty, he once more renewed the war against the Catholic party, in the beginning of 1569, and was again defeated and taken prisoner at the battle of Jarnac, 13th Mar. of the same year. While his wounds were being dressed on the field, a captain of the Swiss guard, named Montesquieu, approached, and shot him through the head. C. was of a joyous and amorous disposition. His gallantries were far from being in accordance with the austere character of the religion he professed, and it cannot be doubted that the feeling of political rivalry to the house of Lorraine, which animated the Bourbon family, explains the career of C. quite as much as his religious convictions.

CONDÉ, Louis II. of Bourbon, Prince of, commonly termed "the great Condé," was the great-grandson of the preceding, and was b. Sept. 8, 1621. In youth (1640–42), he took part in the sieges of Arras and Perpignan, and commanded the army against the Spaniards in the Netherlands, where he almost extirpated the foe in the battle of Rocroi, May 19, 1643. In the autumn of the same year, he was sent to Alsace to support Turenne; and in the engagements of Aug. 3 and 5, 1644, he defeated the Bavarian gen. Mercy near Freiburg, and so won for France a considerable portion of Germany. By the death of his father, 1646, C. became the head of his family, and, next to the duke of Orleans, was the highest personage in the state. This pre-eminence excited the envy of cardinal Mazarin, who, however, in 1648, intrusted C. with the command of the army in the Netherlands. Here the prince captured Ypres, and gained the battle of Lens, but was called back to Paris by the war of the Fronde (q.v.), which had just broken out. In this contest, C. at first sided with the court, while his brother, prince of Conti, and his sister, the celebrated duchess of Longueville, took the part of the *Frondeurs*. After the court had secretly escaped from Paris (Jan. 6, 1649), C. concluded a treaty which insured the return of the court to Paris in Aug. of the same year. But as this service met with no adequate thanks, C., who was the haughtiest Frenchman of his age, soon became more violently rebellious than the Frondeurs themselves, at least in his language and deportment. Cardinal Mazarin consequently arrested C., with his brother and the duke of Longueville; but was soon compelled to release him, on account of the threatened operations of Turenne and the Fronde. Though C. now enjoyed the favor of the people, his relations with the court were unfriendly even after Mazarin had been banished, and when Louis XIV. assumed the government, 1651. He therefore renewed the war, with, as some suppose, the ambitious view of obtaining the supreme power. At the head of troops collected in the Netherlands, he gained the battle of Bleneau, in April, 1652, and immediately marched upon Paris, while Turenne, who had remained steady in his loyalty, advanced to defend the court. A bloody but indecisive struggle took place in the streets of Paris. Many of C.'s ablest adherents, however, were killed, and the Frondeurs began to give in. A treaty was drawn up, to which most of them agreed, but the proud impracticable C. would have nothing to do with it; furious at the defection of so many of his friends, he went into Champagne to gather troops, and after a fruitless effort to seize Paris, he left the country, and, on the formal outbreak of war between France and Spain, became generalissimo of the Spanish forces, but was unable to gain the advantage over Turenne. When the peace of the Pyrenees was concluded between France and Spain, it was thought advisable to enter into friendly relations with the brilliant traitor. C. was therefore pardoned, and reinstated in his former honors. The war having been renewed by Spain, 1673, he again commanded the French in the Netherlands. After Turenne's decease, he held the command in Germany, but was ultimately so disabled by gout, that he had to resign his post. He now retired to his estate of Chantilly, where he devoted his remaining years to literature (for which, in his early years, he had exhibited a strong predilection), the society of friends, and religious exercises. He died at Fontainebleau, Dec. 11, 1686. The prince of C. had a superior intellect and great strength of character, associated with pride. Though an able commander, he was disliked by the soldiers, on account of his severity.—Mahon, *Life of the Great Condé* (1840).

CONDÉ, Louis Henri Joseph de Bourbon, Prince de, son of Louis Joseph, and last prince of Condé, 1756–1830. When he was quite young he fought a duel with the count d'Artois (afterward Charles X.). At the siege of Gibraltar in 1782, he was wounded. In the revolution of 1793, he early came forward and served in the Condé army. He was not married, and his mistress prevailed upon him to settle his fortune on the son of Louis Philippe, the duc d'Aumale. At the revolution of 1830, he pro-

posed to change this will, but before doing so he was found strangled. It was judicially decided that he had committed suicide.

CONDÉ, Louis Joseph de Bourbon, Prince de, 1736–1818. His father left him an orphan when he was but three years old. He was bred to arms, and won distinction in the seven years' war. In the revolution of 1793, he fled to the Rhine frontier, and with an army of fugitives co-operated with the Austrians. In 1797, he went to Russia, and served two years later in the campaign in Switzerland, and still later he was in the Austrian service. After the restoration, Louis XVIII. made him grand-master of the royal household. He wrote an essay on the life of the first Condé, and a history of the family.

CONDENSER, the apparatus used in conjunction with an electrometer to increase its sensibility, and render it available for indicating the presence of very feeble electricity. The condensing apparatus consists of two brass plates, which are placed horizontally, the lower one being connected with a metal rod to which gold leaves are attached, and the upper one being provided with an insulating glass handle. These plates are accurately ground, the one to the other, so that when placed upon each other, they touch in every part. Their inner surfaces are covered with a very thin and equable layer of shellac. When an observation is made, the excited body is brought into contact with the lower plate, and the finger of the observer is laid upon the upper. This being done for a sufficient time, the finger is first removed, and then the excited body, after which the plate is lifted by its handle parallel to the other plate, the gold leaves at the same time diverging under the influence of the electricity left in the lower plate. The same observation might have been made with the positions of the finger and the excited body reversed, but the leaves would then be charged with the opposite electricity to that of the excited body. Reverting to the first case, the electricity to be tested is communicated to the lower plate in small successive charges, which, acting through the thin layer of shellac, induce, as in the Leyden jar, a corresponding charge of the opposite electricity on the lower surface of the upper plate, and send the similar electricity of the upper plate through the finger into the ground. Each weak charge of electricity given to the lower plate is not allowed to dissipate, but is kept fixed or bound by the corresponding charge of the opposite electricity which it has induced on the upper plate, so that an accumulation of such charges takes place. As yet, however, there is no excitement visible in the gold leaves, the electricity so condensed in the plate being capable of acting only in one direction—viz., towards the charge of the upper plate. When, however, the plate is removed, the collected electricity of the lower plate being no longer restrained to act towards it, immediately extends to the leaves below, and causes a marked divergence. In this manner, electricity of too low a tension to affect immediately the gold leaves can be condensed, so as to possess the power of doing so.

It is found that the efficiency of the C. depends upon the accurate grinding of the plates, the thinness and evenness of the layer of shellac with which their inner surfaces are varnished, the size of the plates, and their parallelism on removal. This last is of the utmost importance; and it is found, where numerical results are wanted, that little dependence can be placed on the parallelism attained by the hand. For more accurate observations, the C. is made quite separate from the electrometer. The plates are in this case attached vertically to two wooden pillars, on which they are insulated, and which slide in a horizontal groove made in the sole of the instrument. The plates, thus guided by the grooves, are made to approach and to retire from each other with their faces parallel. In a C. of this description, no shellac varnish is used, the air between the plates acting as the dielectric in its place. When one of the plates is connected with the knob of the electrometer, the observation proceeds as already detailed.

CONDENSING STEAM-ENGINE. See Steam-engine.

CONDER, Josiah, 1789–1855; an English author, editor of the *Eclectic Review* and *The Patriot*. He published also many works on religious, political, and miscellaneous subjects. The most popular of these was his *Modern Traveler*, a series of 30 volumes descriptive of the various countries of the globe.

CONDESCEN'DENCE. In the judicial procedure of Scotland, a C. is an articulate statement of the facts, accompanied with a note of the grounds in law on which the pursuer of an action rests. Formerly, the C. was a separate pleading from the summons, or judicial writ by which the defender is called into court. By the passing of 13 and 14 Vict. c. 36 (31st Oct., 1850), and several subsequent statutes, the forms in Scotland were very much simplified. The summons, in place of containing a rambling statement of the grounds of action, which was afterwards to be rendered articulate and explicit by the C., is now a merely formal writ, setting forth the name and designation of the pursuer and defender, and the conclusions of the action. To the summons, however, is appended a C. setting forth the grounds of action in articulate statements, and to this again is subjoined a note of pleas in law, so that the whole case of the pursuer is contained in the very first pleading in the cause. The papers on both sides may be revised if necessary; and the record, as the written pleadings and productions are called, is then adjusted by the judge. The cause is then ready for debate (q.v.).

CONDESCENDENCE AND CLAIM. See MULTIPLEPOINDING.

CONDICT, JOHN, 1755–1834; b. N. J.; a soldier and surgeon in the revolutionary army. He was several times chosen to the state legislature, was a representative in congress for three terms, and U. S. senator from 1803 to 1817.

CONDILLAC, ETIENNE BONNOT DE MABLY DE, a French philosopher of the 18th c., was b. at Grenoble, 1715. In early youth, his delicate health delayed his progress in education. In 1746, he published his *Essai sur l'Origine des Connaissances Humaines*, a work which derives all thought and knowledge from the exercise of the senses. It was intended to carry out the principles of Locke, which were misunderstood and misrepresented by C. as entirely based on sensationalism. To refute various metaphysical theories, C. wrote a *Traité des Systèmes* (1749). In 1754, appeared his *Traité des Sensations*—a work supplying the details of the sensational theory. C. supposes a statue organized within like a man, but its body—so to speak—being composed of marble, hinders it from possessing any sensibility. C. further supposes himself to have the power of endowing the statue with one sense after another, until it becomes perfectly a human being, and so endeavors to show that as it would then possess exactly the same kind of ideas as ourselves—and yet while destitute of sensations, possessed none—it logically follows that ideas spring exclusively from sensations. In all his writings, C. displayed acuteness in analysis, and, as consistently as was possible, adhered to the extreme theory of sensationalism. C. passed his life mostly in quiet retirement, and died at his estate near Beaugenci, Aug. 3, 1780.

CONDIMENTS, or seasoning agents, are those substances which are employed at table for the purpose of imparting a flavor or seasoning to the ordinary solid or liquid food. The greater part of C. are necessary to sustain the proper functions of the alimentary system, and, besides gratifying the appetite, minister, more or less, to the wants of the structure. The principal C. are saline substances, such as common salt; acidulous bodies, such as acetic acid or vinegar; oily C., such as butter and olive-oil; saccharine substances, such as sugar and honey; and aromatic and pungent C., such as mustard, ginger, pepper, and pickles. The members of the last class owe their characteristic properties to the presence of a volatile oil or resin.

CONDITION, in law. This word is of peculiar importance in the real property law of England, as forming the foundation upon which the right of alienation of land, as well as the system of entails and that of mortgages was raised. Originally, a gift of an estate to a tenant (or vassal) by the lord of the fee did not convey more than a life-estate; and when a gift was made to a man and the heirs of his body, it was held that it was a gift upon C. that he had heirs of his body. But if the C. was performed by his having children, although they might all die before his own death, the judges held that his estate became absolute, to the effect that he might aliene the land, and so bar not merely the succession of his issue, but the right of the lord in default of issue, although, if he did not aliene, the lord would recover in the event of the tenant's death without issue. But it came afterwards to be held that a gift to a man and the heirs of his body conferred what is called an estate tail, which might at once, by certain forms, be converted into an absolute estate, independent of the birth of issue. See ENTAIL.

A mortgage is an estate given to the mortgagee upon C. that he restores it upon payment of a fixed sum borrowed by the mortgager. This is an example of an estate upon C. *expressed*. An estate attached to an office is an estate in the holder of the office upon C. *implied*, that he shall perform its duties. A C. may also be either *precedent* or *subsequent*. In the former case the gift does not take effect until the C. is performed; in the latter, it becomes void when the C. occurs. The right to take advantage of a C. subsequent cannot be bestowed on a stranger, but can only be reserved to the grantor and his heirs, though after such reservation it may be assigned to a stranger. Conditions which are incapable of performance, or contrary to law, are void; and if such a C. is precedent, it makes the gift void; if subsequent, the estate becomes absolute in the tenant. But if a C. become illegal, or impossible, subsequently to the making of the grant, it has a different effect, according as the effect is produced by statute or by other circumstances. If by statute, the party bound to perform the C. is relieved from it; if by other circumstances, he loses his right, as being unable to perform the condition.

In contracts, conditions which are *mala in se* render the contract void; but it is otherwise if the C. is merely opposed to an arbitrary rule of law, in which case the C. only is void, and the contract subsists. In legacies, a similar rule prevails. But in the case of legacies, a C. impossible of performance is generally taken *pro non scripto*—whereas in contracts, it commonly annuls the claim of the party who has bound himself to its performance

CONDITION, in logic, denotes that which must precede the operation of a cause. It is not regarded as that which produces an effect, but as that which renders the production of one possible. For instance, when an impression is made on wax by a seal, the seal is said to be the cause; the softness or fluidity of the wax, a condition. Some logicians, however, are of opinion, that the distinction usually made between C. and cause is arbitrary.

CONDITION. See TRAINING.

CONDITIONED, THE PHILOSOPHY OF THE. This phrase has been brought into use by sir W. Hamilton, to express the inability of the human mind to conceive or reason respecting the absolute and the infinite. Our thought, according to him, can only be of the *relative* and the *finite*, of which these terms are but the negations; relativity and finitude are the conditions under which the human intelligence operates. In a dissertation on this subject (*Discussions in Philosophy*, p. 1), he criticises and endeavors to refute the opposite position as maintained by Cousin—a modification of the previous doctrine of Schelling—that "the unconditioned, the absolute, the infinite, is immediately known in consciousness, and this by difference, plurality, and relation."

As this doctrine of sir W. Hamilton has been raised into an especial importance by Mr. Mansel in his *Brampton Lectures*, some account of the reasonings adduced in its favor may here be given. We shall first quote the author's own statement:

"In our opinion the mind can conceive, and consequently can know, only the *limited, and the conditionally limited.* The unconditionally unlimited, or the *infinite*, the unconditionally limited, or the *absolute*, cannot positively be construed to the mind; they can be conceived only by thinking away from, or abstraction of, those very conditions under which thought itself is realized; consequently, the notion of the unconditioned is only *negative*—negative of the conceivable itself. For example: On the one hand, we can positively conceive neither an absolute whole, that is, a whole so great that we cannot also conceive it as a relative part of a still greater whole; nor an absolute part, that is, a part so small that we cannot also conceive it as a relative whole, divisible into smaller parts. On the other hand, we cannot positively represent, or realize, or construe to the mind (as here understanding and imagination coincide) an infinite whole, for this could only be done by the infinite synthesis (union) in thought of finite wholes, which would of itself require an infinite time for its accomplishment; nor, for the same reason, can we follow out in thought an infinite divisibility of parts. The result is the same, whether we apply the process to litimation in *space*, in *time*, or in degree. The unconditional negation, and the unconditional affirmation of limitation; in other words, the *infinite*, and the *absolute, properly so called*, are thus equally inconceivable to us."—*Discussions*, p. 13, 2d edition.

The fundamental ideas involved in this view are certain observed facts with reference to the human mind, or the human consciousness; which facts, although very much overlooked in former times, are now beginning to be pretty generally recognized. It is a general law of our mental constitution, that change of impression is essential to consciousness in every form. The remark was made by Hobbes, that it is "almost all one for a man to be always sensible of one and the same thing, and not to be sensible at all of anything." There are notable examples to show that an unvarying action on the senses fails to give any perception whatever. Take the pressure of the air on the surface of the body. Here we have an exceedingly powerful effect upon one of the special senses. The skin is under an influence exactly of that nature that wakens the feeling of touch, but no feeling comes. Withdraw any portion of the pressure, as with a cupping-glass, and sensibility is developed. A constant impression is thus, to the mind, the same as a blank. Our partial unconsciousness of our clothing is connected with the constancy of the object. Remission or change is, therefore, absolutely requisite in order to sensibility.

The necessity of change in order to produce feeling or consciousness of any sort, must apply to the special kind of consciousness that we call knowledge. To know light, is to pass from its presence to its absence, or the opposite; everlasting, unvarying luminosity, in an eye always awake, would not be known to the human mind. It is transition that develops knowledge, whence flows the important consequence, that knowledge *never can be of one property alone;* there must always be at least two properties in every act of knowing. We may say that we know light; but in so doing we also know darkness, and we could not know either by itself. When we touch clay and marble, we know hard and soft; but if we had never touched a soft body, we should have no conception of a hard one. Living in one constant temperature, like the fish in the tropical seas, we should know neither heat nor cold; passing from a high temperature to a low, or from a low to a high, we know both; and such is the alternative presented in every case to the human understanding. This great fundamental law of the human mind is now commonly designated by the phrase, *the relativity of knowledge or of cognition.*

Mr. Mansel, accordingly, disputes the possibility of our conceiving the infinite, by showing that such a conception passes the limits of human consciousness. The following extract will show his mode of reasoning: "Now, in the first place, the very conception of consciousness, in whatever mode it may be manifested, necessarily implies *distinction between one object and another.* To be conscious, we must be conscious of something; and that something can only be known as that which it is, by being distinguished from that which it is not. But distinction is necessarily limitation; for, if one object is to be distinguished from another, it must possess some form of existence which the other has not, or it must possess some form which the other has. But it is obvious that the infinite cannot be distinguished, as such, from the finite, by the absence of any quality which the finite possesses; for such absence would be a limitation. Nor yet can

it be distinguished by the presence of an attribute which the finite has not; for, as no finite part can be a constituent of an infinite whole, this differential characteristic must itself be infinite, and must at the same time have nothing in common with the finite. We are thus thrown back upon our former impossibility."—Lecture 3d.

"A second characteristic of consciousness," according to Mr. Mansel, "is, that it is only possible in the form of a *relation*. There must be a subject, or person conscious, and an object, or thing of which he is conscious. There can be no consciousness without the union of these two factors; and, in that union, each exists only as it is related to the other. The subject is a subject, only in so far as it is conscious of an object; the object is an object, only in so far as it is apprehended by a subject; and the destruction of either is the destruction of consciousness itself. It is thus manifest that a consciousness of the absolute is equally self-contradictory with that of the infinite. To be conscious of the absolute as such, we must know that an object which is given in relation to our consciousness, is identical with one which exists in its own nature, out of all relation to consciousness. But to know this identity, we must be able to compare the two together; and such a comparison is itself a contradiction. We are, in fact, required to compare that of which we are conscious, with that of which we are not conscious, the comparison itself being an act of consciousness, and only possible through the consciousness of both objects."

The author then lays down a third condition of consciousness—namely, relation to *time*. Everything conceived by us is conceived as under the two manifestations of *succession* and *duration*, from which he endeavors to show "that an act of *creation*, in the highest sense of the term—that is to say, an absolutely first link in the chain of phenomena, preceded by no temporal antecedent—is to human thought inconceivable. To represent in thought the first act of the first cause of all things, I must conceive myself as placed in imagination at the point at which temporal succession commences, and as thus conscious of the relation between a phenomenon in time and a phenomenon out of time. But the consciousness of such a relation implies a consciousness of both the related members; to realize which, the mind must be in and out of time at the same moment.

And, further: "Subordinate to the general law of time, to which all consciousness is subject, there are two inferior conditions, to which the two great divisions of consciousness are severally subject. Our knowledge of body is governed by the condition of *space*, our knowledge of mind by that of *personality*. I can conceive no qualities of body save as having a definite local position; and I can conceive no qualities of mind save as modes of a conscious self."—Lecture 3d.

By the application of those four conditions or limitations of human consciousness—distinction, relation, succession, and duration in time, and personality as regards the conception of mind—it is Mr. Mansel's purpose to demolish the foundations of the metaphysical theology of former ages, which was largely conversant with proofs *à priori* of the infinity and the absolute existence of a Deity. According to him, a rational theology is impossible to be attained. "Our whole consciousness manifests itself as subject to certain limits, which we are unable, in any act of thought, to transgress. That which falls within these limits, as an object of thought, is known to us as *relative* and *finite*. The *absolute* and the *infinite* are thus, like the *inconceivable* and the *imperceptible*, names indicating, not an object of thought or of consciousness at all, but the mere absence of the conditions under which consciousness is possible. The attempt to construct in thought an object answering to such names, necessarily results in contradiction—a contradiction, however, which we have ourselves produced by the attempt to think—which exists in the act of thought, but not beyond it—which destroys the conception as such, but indicates nothing concerning the existence or non-existence of that which we try to conceive. It proves our own impotence, and it proves nothing more."

CONDOM, a t. of France, in the department of Gers, pleasantly situated on a height on the river Baise, here crossed by two bridges, 25 m. n.n.w. of Auch. The town is very old, having been founded in 721, is irregularly built, but has handsome suburbs. It has a handsome Gothic church, an exchange, and two hospitals. There is a very considerable trade in grain, flour, wine, and brandy, and manufactures of cotton and mixed fabrics, cotton yarn, and earthenware. C. was formerly the capital of an extensive district, now comprised in the departments of Gers, Landes, and Lot-et-Garonne. Bossuet was at one time bishop of Condom. Pop. '76, 4,933.

CONDONATION, in the legal phraseology both of England and Scotland, means forgiveness, or *remissio injuriarum*, when urged as a defense against an action of divorce on the ground of adultery.

CONDOR, *Sarcoramphus gryphus*, the great vulture of the Andes, and the largest of known flying birds. Its dimensions, however, were for a long time greatly exaggerated. It is not always much larger than the *lämmergeyer* of the Alps, being sometimes scarcely more than 4 ft. long, and its expanse of wings about 9 ft., although these dimensions are often considerably exceeded, and the expanse of wings reaches fully 14 feet. The wings are long, and extremely powerful; the tail short, and wedge-shaped; the general color black, which is brightest in old males, the young being of a brownish color which has given rise to a notion that there are two species; the males

are also distinguished by having great part of the wings white. Around the lower part of the neck of both sexes there is a broad white ruff of downy feathers, above which the skin is bare, and exhibits many folds. The head of the male is crowned with a large cartilaginous comb, and the neck is furnished with a dilatable wattle. The beak is thick and strong, straight at the base, but the upper mandible strongly curved at the extremity. The C. feeds mostly on carrion. Its voracity is enormous. Tschudi mentions one in confinement at Valparaiso which ate 18 lbs. of meat in a single day, and seemed next day to have as good an appetite as usual. Condors often gorge themselves so that they cannot fly, and, if attacked, must disgorge in order to escape. They inhabit regions 10,000 or 15,000 feet above the level of the sea, where they breed, making no nest, but laying their eggs on the bare rocks, and where they are usually seen in small groups. To these haunts they return, after their descents into the plains for food. The height to which the C. soars in the air exceeds that of any other bird, and is said to be almost 6 perpendicular m. above the level of the sea, or nearly six times the ordinary height of the clouds.—To the same genus with the C., distinguished by the cartilaginous comb, bare neck, and peculiar shape of bill, belong the king vulture, or king of the vultures (*S. papa*), of the warm parts of America, and the Californian vulture (*S. Californianus*). The king of the vultures is about the size of a goose, and derives its name from its driving away other vultures from prey at its pleasure. Its plumage is finely colored, reddish above, white beneath, with bluish-gray ruff, and black quills and tail. —The birds of this genus have no voice, and make only a sort of weak snorting.

CONDORCET, Jean Antoine Nicolas De Caritat, Marquis de, an eminent French author, was b. Sept. 17, 1743, at Ribemont, near St. Quentin, in the department of Aisne; studied at the college of Navarre; and by his *Essai sur le Calcul Integral* (afterwards given in an extended form in his *Essais d'Analyse*), gained for himself, at an early age, a seat in the academy of sciences. With ease and remarkable ingenuity, C. treated the most difficult problems of mathematics; but though deserving high praise, his powers lay rather in suggestion than in rigorous demonstration. After the appearance of his *Eloges des Académiciens Morts avant* 1699 (Paris, 1773), he was made secretary of the academy, 1777. His theory of comets gained, in the same year, a prize in the Berlin academy. In concert with Turgot, he was induced to subject the system of the economists to a close examination, and was led by D'Alembert to take an active part in the *Encyclopédie*. In all his works—as, for example, in the *Eloges et Pensées de Pascal*—we find noble views of human destiny, and evidences of a truly benevolent disposition. At the revolution, he was elected member for Paris in the legislative assembly, of which he was president in 1792. In the national convention, as deputy for the department of Aisne, he mostly voted with the Girondists, and shared in the downfall of that party. Accused, in Oct., 1793, he concealed himself, and consequently was outlawed. A generous lady, Mme. Verney, had the courage to provide for him a hiding-place, where he remained for some months, and in very miserable circumstances wrote his most remarkable work, the *Esquisse des Progrès de l'Esprit Humain*. Having afterwards quitted his concealment, he was arrested at Clamart, sent to Bourg-la-Reine, and cast into prison. The next morning, Mar. 28, 1794, he was found lying dead on the floor. He had, it is believed, poisoned himself. His collected works (exclusive of his mathematical essays) were edited by Garat and Cabanis (21 vols., Paris, 1804).—His wife, Sophie de C. (sister of marshal Grouchy), born 1765, assisted in the literary labors of C., and also translated into French Adam Smith's *Theory of Moral Sentiments*. She died Sept. 6, 1822.

CONDOTTIËRI, the name given in the 14th c. to the leaders of certain bands of military adventurers who, for booty, offered their services to any party in any contest, and often practiced warfare on their own account purely for the same of plunder. These mercenaries were called into action by the endless feuds of the Italian states during the middle ages. Among the most celebrated of their leaders were Guarnieri, Lando, Francis of Carmagnola (about 1412), and Francis Sforza (about 1450). The last-mentioned made himself duke of Milan. The *Compagnies Grandes* in France, during the 14th c., resembled the bands led by the Italian condottieri. They originated in the long bloody wars between France and England. The mischief done by them became so intolerable, that in several parts of the country the peasantry armed themselves, and, under the name of *pacifères*, formed associations against the plunderers. Nevertheless, these French C. were so powerful that, in 1361, they routed the king's forces which had been sent against them, at Brignais, near Lyon, and slew the constable of France, Jacques de Bourbon; but the constable du Guesclin having persuaded them to seek their fortune in the Spanish service, they at length disappeared from the country.

CONDUCTOR, in music, is the person placed at the head of a band of musicians to lead the performance and beat the time. In Germany, the term dirigent is used, which is more expressive.

CONDUCTORS, in the royal artillery, are those artillerymen who have charge of the ammunition-wagons in the field; they are, to some extent, under the control of the commissariat officers, who have to provide means of transport; but since the recent changes in the commissariat department, they have been more exclusively under the control of their own proper artillery officers.

CONDUCTORS AND NON-CONDUCTORS OF ELECTRICITY. If a rod of metal be made to touch the prime conductor of an electrical machine immediately after the plate has ceased to rotate, every trace of electricity immediately disappears. But if the rod were of shellac, little or no diminution would be perceptible in the electrical excitement of the conductor. The metal in this case leads away the electricity into the body of the experimenter, and thence into the ground, where it becomes lost, and it receives in consequence the name of a conductor. The shellac, for the opposite reason, is called a non-conductor. Different substances are found to possess the power of conducting electricity in very different degrees. The following series classifies the more common substances according to their conducting powers, beginning with the best, and ending with the worst conductors: Conductors—The metals, graphite, sea-water, spring-water, rain-water. Semi-conductors—Alcohol and ether, drywood, marble, paper, straw, ice at 32° F. Non-conductors—Dry metallic oxides, fatty oils, ice at—13° F., phosphorus, lime, chalk, caoutchouc, camphor, porcelain, leather, dry paper, feathers, hair, wool, silk, gems, glass, agate, wax, sulphur, resin, amber, shellac.

The arrangement into conductors, semi-conductors, and non-conductors, is made with reference to frictional electricity, or electricity of a high tension. The substances which are semi-conductors for frictional electricity are found to be almost, if not altogether, non-conducting for the electricity of the galvanic battery, which is too feeble to force a passage through them. The metals, which appear to be all nearly alike conducting for frictional electricity, offer widely differing resistances to the transmission of the galvanic current. By experiments made with galvanic electricity, it is found that the more ordinary metals stand thus, as regards their powers of conduction, beginning as before with the best conductor: Silver, gold, copper, brass, zinc, iron, platinum, tin, nickel, lead, German-silver, mercury. An increase of temperature has in the metals the effect of lessening the conducting power, whilst in almost all other substances it has an opposite effect. Glass becomes conducting at a red heat, and so do wax, sulphur, amber, and shellac, when fused.

When a conductor is placed on non-conducting supports, so as to prevent the electricity communicated to it from passing into the ground, it is said to be insulated. The usual insulating material employed in the construction of electrical apparatus is glass, which, though not so perfect a non-conductor as the others lower in the scale, far exceeds them in hardness and durability. In a damp atmosphere, glass becomes coated with a thin layer of moisture, which very considerably diminishes its insulating power. Hence arises the necessity in certain states of weather of heating so as to dry all electrical apparatus previous to use. This imperfection is very much lessened by covering the glass with shellac varnish.

The very fact that a conductor may be insulated, indicates that the air is a non-conductor. Dry air possesses this property in a high degree, while moist air renders insulation for any length of time impossible.

CONDY'S FLUID. See MANGANESE.

CONE. There are various kinds of cones, but the term is usually applied only to those having circular bases. The most common kind of circular C. is the *right* C., which may be conceived as being generated by the revolution of a right-angled triangle round one of its legs. The line from the apex of a C. to the center of the base is called the axis, and, in the right C., it is perpendicular to the base. In the *oblique* C., the axis is inclined to the plane of the base at an angle other than a right angle. A *truncated* C. is the lower part of a C. cut by a plane parallel to the base.—Four curves, called the CONIC SECTIONS, may be formed by cutting the right C. in different directions. If the C. be cut by a plane parallel to the base, the section is a circle; if the plane cut the C. across, making any angle other than a right angle with its axis, the section is an ellipse; if the cutting plane be parallel to the side of the C., the section will be a parabola. In every other case than those stated, the section will be an hyperbola. If two cones were set one above the other, the one being just a continuation of the other through the apex, the plane producing the hyperbolic section would cut the second as well as the first, though none of the other planes would. There are thus two equal branches of the hyperbola belonging to the two cones respectively. See CIRCLE, PARABOLA, etc.

CONE, *Strobilus*, in botany, a fruit-bearing spike covered with scales, each of which has two seeds at its base. Such are the fruits of the *coniferæ* (fir-cones or fir-tops), from the usual shape of which the name C. is derived, also the fruits of the *casuarineæ*. The name C. is applied also to the female spike, even when in flower. The scales of true cones, until they separate to allow the dispersion of the seeds, are closely compacted together; in the hop, to the fruit of which the name C. is not applied, although *strobilus* is, they are loose. Some true cones, as those of the *araucaria*, are very far from being conical in shape. The fruit of the juniper (a *galbulus*) is a C. of which the scales have become fleshy, so as to form a false berry.

CONE, SPENCER HOUGHTON, D.D., 1785–1855; b. N. J.; studied at Princeton college. His mother became a widow when he was about 14 years of age, and he undertook teaching to support the family. He also became an actor, and played in Philadelphia and other cities with good success for seven years. He was engaged to be married, but the prospective bride required him first to abandon the stage, which he did, and took an

editorial position on a Baltimore newspaper. During the war with England, he served in the army, and was present in the attack on Washington and Baltimore. He next turned his attention to the pulpit, and while holding a small government office, preached in some churches in Washington and the neighborhood. In 1815–16, he was chaplain to congress, and in 1823 was called to the Oliver street Baptist church, New York city. In 1841, he took charge of the Broome street church, where he remained during life. In 1832, he presided over the Baptist general conference for the United States. During his entire ministry he was conspicuous in all branches of church work. In 1850, he, with others, published a pamphlet recommending a new translation of the Bible. The idea did not find favor at the time, but the work was undertaken at a later period through the agency of the American Bible union, an organization of which Cone was the president.

CONE'CUH, a co. in s. Alabama, on the Escambia river, crossed by the Mobile and Montgomery railroad; pop. '80, 12,606—6,377 colored. The surface is hilly, and the soil sandy. Cotton is the most important crop. Co. seat, Sparta.

CONEGLIAN'O, a t. of northern Italy, 28 m. n.e. of Venice. It is situated on a hill-slope, crowned by an extensive castle, and has a very picturesque appearance. Half-obliterated frescoes adorn the outside of several houses in the town. C. has manufactures of woolens and silks, and a pop. of 6,500.

CONE'JOS, a co. in s.w. Colorado, on the Utah and New Mexico borders, bounded e. by the Rio de Norte; 11,000 sq.m.; pop. '80, 5,605. There are several ranges of mountains in the co.; but also much good land, and gold and silver deposits. The w. section is taken up by the Ute Indian reservation. Besides Indians, the inhabitants are chiefly Mexicans or half-breeds. Co. seat, Conejos.

CONE-SHELL (*conus* and *conida*), a genus and family of gasteropodous mollusks, of the order *pectinibranchiata*, having a shell of remarkably regular conical form; the spire on the base of the cone, and sometimes rising from it to a sharp point, sometimes almost flat; the aperture narrow and straight, without protuberance or fold, extending from the base of the cone to its apex. The head of the animal has a proboscis capable of much extension; the mantle is scanty and narrow, forming an elongated siphon in front; the shell covered with an epidermis. These mollusks are carnivorous; they inhabit shores and banks of sandy mud, chiefly within the tropics, a few only occurring in the Mediterranean. The shells of many species are very beautiful, and much prized by collectors.—Cone-shells first appear in the chalk, and become more abundant in the more recent formations.

CONESTO'GAS, or GANDASTOGUÉS, Indians once living in Pennsylvania, called by the people of Maryland "Susquehannas," and by the Dutch "Minquas." They were of the Iroquois family, and were once very powerful. Near the close of the 16th c., they nearly exterminated the Mohawks, and held several tribes in subjection. After almost continual war with their neighbors for a century, they were quite subdued in 1675. Their king made a treaty with William Penn in 1701. Another treaty was made with them in 1742, at which time but few of the tribe were left. During an excitement against red men in 1763, the few remaining members of the tribe took refuge in the jail at Lancaster, Pa., where they were murdered by a band of white ruffians. One of the foremost of their chiefs was Logan (in Indian, Tah-gah-jute), whose speech so famous for eloquence and pathos will be well remembered by people who were familiar with American school-books of the early part of the 19th century. The Swedish missionary Campanius made a vocabulary of the Conestogas language.

CONEWAN'GO CREEK, a small stream in Cattaraugus co., in w. New York, which forms part of a line of continuous water navigation from the gulf of Mexico through the Mississippi, the Ohio, and the Alleghany rivers, and this creek and Chautauqua lake, to a point only 10 m. from lake Erie.

CONEY ISLAND, in Kings co., N. Y., 9 m. s.e. of New York city. It was one of the first places of landing of the Dutch discoverers, and for 240 years was regarded as worthless except for pasturage. About 1840, steam-boats began Sunday and holiday excursions from the city to Coney Island, and cheap hotels and rude bathing-houses were put up. For the next 25 years the island was a favorite though not always reputable resort; but the extraordinary growth of New York, and especially of Brooklyn, turned attention to the island as a summer resort, and better accommodations were provided, order was enforced, and it became fit for the reception of respectable people. About 1875, a great impetus was given to its popularity by the construction of steam railroads and the erection of immense hotels of the best class, and last year (1879) the island was visited by more people during the summer season than any other place of resort in America. It is reached by 7 or 8 railroads, and by 7 regular lines of steamers. The island is nearly 5 m. long by ½ to ¾ wide, and is nowhere more than 20 ft. above high water. It is separated from the mainland by a tidal stream in some places not more that 12 ft. wide. The pop. varies from 15,000, or more, in summer, to 100, or less, in winter.

CONFARRÉA'TION was a peculiar mode of marriage in use among the Romans, and supposed to have been originally that practiced by the patricians. Its specialty consisted in the employment of certain words in the presence of 10 witnesses, and in the performance of a religious ceremony in which *panis farreus* (bread made of spelt)

was used. Various priestly offices, such as that of the *flamen dialis*, were open only to those who were born of parents thus married.

CONFECTIONERY, preparations of sugar, or of material of which sugar is the principal ingredient. There are endless varieties of these preparations, from simple candies unadorned and shapeless, to the most elegant and costly works of art. One of the simplest forms is that of lozenges, or drops of plain or flavored sugar. In making these the sugar is ground to a fine powder, after which it is mixed with dissolved gum arabic so as to form a stiff dough; then rolled, or cut and pressed by machinery into the required forms. Another variety is known as comfits. To make these a core or center of some kind is required, and these cores consist usually of nuts or small fruits, varying from a caraway seed to a peach or a pear. Around such cores successive layers of sugar are deposited until the required size is reached; and to do this the cores are placed in large copper vessels which are geared so as to move back and forth in a small angle, whereby the cores are kept in constant motion, the mixture being steadily supplied with pure strained sirup of sugar. Much talent is expended in large cities in making and ornamenting confectionery for table show-pieces. Where confectionery is pure its use may involve little danger to health. Unfortunately it cannot be doubted that a large proportion of the cheaper kinds are adulterated, and colored with poisonous stuffs.

CONFEDERATE STATES OF AMERICA. See REBELLION, WAR OF THE.

CONFEDERATION, an alliance of nations, states, or princes; sometimes used for a single nation, as that of the Mexican republic, the official title of which is "The Mexican Confederation." The German confederation was formed immediately after the Vienna congress of 1815. In July, 1778, the united colonies (afterwards the United States of America) agreed to the "Articles of Confederation and perpetual Union between the states of New Hampshire, Massachusetts Bay, Rhode Island and Providence Plantations, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, and Georgia." In these articles are set forth the principles of government which were a few years later embodied in the constitution of the United States, with such additions as were necessary "in order to form a more perfect union." In South America is the Argentine confederation, and Switzerland is sometimes called the Swiss confederation. The confederation of the Rhine was formed in 1806 by a number of German states, under the protection of Napoleon.

CONFEDERATION, GERMANIC. See GERMANY.

CONFEDERATION OF THE RHINE. During the war of 1805, so disastrous for Austria, several German princes, too weak to remain neutral, were forced to ally themselves with France. The first to do so were the electors of Bavaria and Würtemberg, who, in recompense of their services, were elevated to the dignity of kings by the peace of Presburg, 26th Dec., 1805. Some months after (28th May, 1806), the arch chancellor of the empire announced at the diet that he had chosen as his coadjutor and successor cardinal Fesch, the uncle of Napoleon, a thing entirely contrary to the constitution of the Germanic empire. Finally, at Paris, on the 12th July, 1806, 16 German princes formally signed an act of confederation, dissolving their connection with the Germanic empire, and allying themselves with France. These 16 princes were—the kings of Bavaria and Würtemberg, the arch chancellor, the elector of Baden, the new duke of Cleves and Berg (Joachim Murat), the landgraf of Hesse-Darmstadt, the princes of Nassau-Usingen, Nassau-Weilburg, Hohenzollern-Hechingen, Hohenzollern-Sigmaringen, Salm-Salm, Salm-Kyrburg, the duke of Arenberg, the princes of Isenburg-Birstein and Lichtenstein, and the count of Leyen. These individuals justified (or were forced to justify) their conduct by enumerating the vices of the constitution of the Germanic empire, and invited the remaining princes of Germany to imitate their example. At the same time, Bacher, the French ambassador, declared that his master no longer recognized the Germanic empire; while the territories and titles of the confederate princes (who were now under the protectorate of Napoleon) underwent considerable changes. In addition to these changes, a number of other princes and nobles of the empire were made dependent (see MEDIATIZATION) on the confederation. During the years 1806–8, several other petty German sovereigns, alarmed at the triumphs of Napoleon, hastened to enroll themselves members of this unpatriotic league; and at the close of 1808, it embraced a territory of 122,236 sq.m., contained a population of 14,608,877 souls, and kept up an army of 119,180 men. The utter ruin which overtook the French army in the Russian campaign acted like a solvent on the confederation, and the year 1813 saw it vanish like mist in the sudden outburst of German patriotism, when a whole people leaped up as one man, and delivered themselves from a cruel and insulting bondage.

CONFERENCE, in English law, signifies the interview of an attorney or solicitor with a counsel, when consulting him. Consultation properly means the meeting of barristers with each other.

CONFERENCE, a coming together to consult upon any cause or course. In legislation there are often committees of conference when the two houses of congress or of a state legislature disagree on any measure. In that case each house appoints a committee, and these committees either agree to a single course, or report to their several houses that no agreement can be made. The two houses may meet in joint session for certain specified

purposes, but never in conference. Between the representatives of nations there have been many important political and commercial conferences, such as those of Vienna in 1820 and 1834, of Paris in 1856, of London in 1864, 1867, and 1871. Of late years, conferences have grown popular. There was an international conference (or congress) at Geneva in 1864, for the organization of the sanitary commission, and at Paris in 1867, on the money question. There have been many ecclesiastical conferences. One was held at Hampton Court palace, at the instance of James I., in Jan., 1604. It was composed of prelates of the church of England and dissenting ministers, the object being to effect a general union. This conference led to the translation of the Bible known to English readers as the authorized version. Another conference was held in 1661, when some alterations were made in the prayer book. Similar conferences were once frequent in the Roman Catholic church; and in other churches there are pastoral and other conferences. The annual meeting of the Wesleyan church of England is called the "Annual Conference;" and the same title is used for annual or other stated sessions in the Methodist Episcopal, the Quaker, the Evangelical, Baptist, and other denominations. Under the name of "Evangelical Church Conference," delegates from the German states and Austria meet for the consideration of questions affecting church matters. See CONFERENCES OF THE METHODIST EPISCOPAL CHURCH.

CONFERENCE, WESLEYAN. See METHODISTS.

CONFERENCES OF THE METHODIST EPISCOPAL CHURCH are five in number: 1. The *Quarterly Conference*, limited to a single pastoral charge (or local church), and having supervision over it. Its members are the pastor, local preachers, exhorters, stewards, and class-leaders, together with the trustees and Sunday-school superintendent, if members of the church. 2. The *District Conference*, embracing the churches of a presiding elder's district, is composed of the pastors, local preachers, exhorters, and one steward and Sunday-school superintendent from each pastoral charge. It has a general supervision of the temporal and spiritual affairs of the district; licenses local preachers, has jurisdiction over them, and recommends them to the annual conference for admission on trial and for orders. 3. The *Annual Conference*, composed wholly of traveling preachers. Possessing no legislative power, its functions are purely administrative. It has the power of discipline over its own members, inquiring annually into the Christian character and ministerial efficiency of each by name. 4. The *Judicial Conference*, instituted for the trial of bishops who may be accused of wrong-doing, and of appeals by convicted members of an annual conference. The annual conferences severally elect seven "triers of appeals." In case of an appeal the triers from three adjacent conferences constitute the judicial conference to which it is referred. For the trial of an accused bishop the triers from five neighboring conferences are necessary. 5. The *General Conference*, the highest judicatory and only legislative body of the church, meets once in four years. It is composed of one minister for every 45 members of each annual conference, and two laymen, chosen by lay electors, from the several quarterly conferences within the same territory. Under certain restrictive rules it has supreme authority, with supervision over all the interests and work of the denomination. It elects the bishops and other general officers. The bishops, who are its presiding officers but not members of it, are subject to its direction and answerable to it for its moral as well as official conduct.

CONFER'VA, a genus of plants of the natural order *algæ*, sub-order *confervaceæ* (or order *confervaceæ*). The plants of this genus consist of simple or branching jointed filaments, which are filled with green—seldom purple or red—matter, and are found in abundance in water—some of them in fresh, and some in salt water—and on moist earth. *C. rivularis*, a species common in brooks, is sometimes 2 to 4 yards in length, and was formerly used as an application to wounds and slight burns. This and other species are sometimes called *crow silk*, and are used in some places for stuffing mattresses. *C. rupestris* often covers whole rocks on the sea-coast. *C. crispa* sometimes forms a close entangled layer on inundated land, and has received the name of *water flannel*. *C. ægagropila*, sometimes called *moor ball*, is found in lakes and ponds, where it floats about freely in the water, its filaments forming an entangled ball, capable of being employed as a pen-wiper.—The name C. is not always strictly limited to the genus, but is extended to many of its near allies. Among the *confervaceæ*—or confervals—however, are included many plants, as the different kinds of laver, which have a flat and not a thread-like frond. Many also consist of cells immersed in a slimy matter. The *confervaceæ* grow by the division and sometimes by the branching of cells; reproduction takes place by *spores*, formed in the interior of the cells, and which at last are discharged through the walls of the mother-cell. The very interesting phenomenon of the conjugation (q.v.) of cells has been observed in them. The spores assume the character of zoospores (q.v.), exhibiting movements which resemble those of animals, before leaving the mother-cell, and retain this character for some time after escaping from it. *Confervaceæ* are found plentifully even in mineral waters. Their great abundance often gives a color to the whole water of tanks, marshes, etc. The Red sea is said to derive its name from the color sometimes given to the surface of its waters, for distances as great as the eye can reach, by small *confervaceæ*. The yeast-plant has been ranked among *confervaceæ*, but is more generally regarded as one of the *fungi*. Other vegetable

organisms which appear in liquids of the most various kinds, and which have also been ranked among *conferveæ*, are more probably the *mycelium* of imperfectly developed *fungi*. The plants noticed in the article ALGÆ as appearing in diseased conditions of animals, are regarded as *conferveæ*.—The lavers are almost the only *conferveæ* ever used for human food.

CONFESSION, JUDGMENT BY, in England, is judgment against a defendant on his confessing both the facts and law alleged by the plaintiff. An agreement to confess judgment is a common mode of securing money, but is subject to strict technical regulations.

CONFESSION, in law, is the admission of his guilt by an accused person. In England, proof of C. is sufficient to warrant a jury in convicting without more evidence; in Scotland, some corroborating circumstance must be proved. In both countries, however, the C., to be admissible, must have been made without any promise or threat held out to induce it. As to C. on trial, see PLEA OF GUILTY; and as to C. before the examining magistrate, see DECLARATION.

CONFESSION (*ante*), in law, is a voluntary declaration, made by one who has committed a misdemeanor or a crime, to some other person, of the agency or participation which he had in the offense. Also, the admission of a prisoner that he is guilty of the offense with which he is charged. If made before a magistrate or in the course of judicial proceedings before a court, such confessions are "judicial;" if made anywhere else, they are "extra judicial." An entirely voluntary confession is admissible in evidence; but not so if procured through inducements, threats, promises or hopes, of escape or favor. A confession in answer to questions by a magistrate or by any other person is admissible. A prisoner's confession when the *corpus delicti* is not otherwise proved, is not sufficient to warrant conviction.

CONFESSION, in Roman Catholic theology, means a declaration of sins to a priest in order to obtain absolution. The practice of C. is believed by Roman Catholics to be of divine institution, being founded on the power of binding and loosing from sin conferred on the apostles by Christ (Matt. xvi. 19, xviii. 18, and John xv. 22, 23). The power of binding *or* loosing, being in the view of its advocates judicial and discretionary, presupposes a confession of sins in order to its being judicially exercised. Although some allusions to C. are found in the New Testament, Catholics do not allege any formal scriptural precept for it, but they contend that the above passages contain an implied precept, which they further support by testimonies of the fathers. Though the apostle James recommends that Christians should confess their "faults one to another," yet formal and open C. appears to have been first required in cases where persons guilty of gross apostasy desired to be again received into the church. Motives of piety, and a wish to avoid the scandal of open C., led gradually to the institution of private C. in the hearing of a priest. In and after the 5th c., such C. was made an indispensable preparation for receiving the sacrament of the Lord's supper. Open or public C., which was part of the discipline of public penance, ceased when that discipline went into disuse. Private C. has been retained, and though its defenders hold it to have been at all times in use, a general law was enacted by the fourth council of the Lateran (can. xxi., *omnis utriusque sexus*), requiring that every Christian who has attained the years of discretion should confess to a priest approved for the purpose, at least once in the year; and they insist that this law was by no means the origin of the precept of C., but merely defined the time of its fulfillment. C. is one of the three "acts of the penitent"—contrition, confession, and satisfaction—which the council of Trent declares to be parts of the sacrament of penance. The sinner is required to confess each and every mortal sin, in thought, word, and deed, which, after diligent examination of his conscience, has occurred to his memory. He is exhorted, but not required, also to confess venial sins (q.v.), especially if they be habitual. C., in order to be fruitful, must be accompanied by contrition and a purpose of amendment. It commonly embraces the sins committed since the last C.; but may include a longer period, and even the entire life. In the latter case, the C. is called general. It is called "auricular," as being made to the private "ear" of the priest; and is ordinarily spoken, but in cases of necessity may be made in writing, by signs, or even by an interpreter. Priests cannot validly receive confessions in any place without the "approbation" of the bishop of the place, which may be given either absolutely or with restrictions. C. is prescribed in the ritual of the Greek, the Russo-Greek, the Coptic, the Syrian, and the other oriental churches. In most of these churches the practice is obligatory, but in some it has gone into disuse. The Lutheran church professes (according to the 11th art. of the *Augsburg confession*) "that private confession must be retained in the church; but that full and particular statement of *all* sins is not necessary, because, according to Psalm xix. 12, it is impossible." In the apology of the Augsburg confession, it is said to be "impious" to abolish the practice of private C. to the priest; but in practice, the Lutheran church has widely departed from these rules. The reformed church (in Germany) has always been more inclined to general C.; and the united church also substitutes for private C. certain devotional exercises previous to communion. The church of England employs a general form of C. and absolution in its morning and evening services, but retains private C. in the rubric for visitation of the sick. The Scotch churches do not recognize it at all.—The *sigillum confessionis* ("seal of confession"), both in the Roman Catholic

and in the German Protestant church, means the obligation of a confessor or priest not to divulge the secrets of the confessional. This custom of secrecy is traceable in the 4th and 5th c., but was made binding by Innocent III. in the 12th, and its violation by a priest makes him subject to the severest penalties that can be inflicted by the church. See CONFIDENTIALITY.

CONFESSIONAL, the seat or recess in which the priest sits to hear confession in a Roman Catholic church. It is probable that the confessionals in English churches, previous to the reformation, like those still found in Catholic use, were slight wooden erections, because they have so entirely disappeared that their form is a matter of dispute among ecclesiologists. It would seem that confessionals were not always used, as in an old painting on the walls of St. Mary's chapel, Winchester, a woman is represented kneeling to a priest, who is seated in his stall. The confessional commonly has a door in front for the priest to enter by, and an opening on one or both sides, like a small window, with a grating of wire or zinc, for the penitents to speak through.

CONFESSION AND AVOIDANCE, in pleading at common law, in England, is the admission of the allegation of the opposite party, but with the addition of some circumstance which deprives it of legal effect, as, for instance, the admitting that an assault was committed as alleged, but with the assertion that it was committed in self-defense. See PLEADING.

CONFESSION OF FAITH. See CREEDS AND CONFESSIONS.

CONFIDENTIALITY, in law. The most common instance of C. is in the case of those communications between a client and his legal adviser, which neither of them can be called on to produce in a suit, and upon which no action of damages can be founded. The privilege extends to letters written by the lawyer to his client, relating to a suit which is either pending or contemplated; but to what extent it covers other business communications, is a question on which there are conflicting authorities in Scotland. In England, the rule has received a liberal interpretation (Dickson on *Evidence*, p. 930). The same privilege is extended to the communications of several parties, or of their counsel and agents engaged on the same side of a cause, and made with a view to their joint prosecution or defense. Where a party, placed in such circumstances, is examined as a witness, he will be entitled to decline answering questions as to such communings, and even bound to do so, unless the privilege is waived by the other party interested (Dickson, p. 924). The principle on which this privilege rests, as stated by Stephen (*Com.* iii. 466), is that these communications are made "on such lawful occasions as tend to rebut the *primâ facie* inference of malice, which otherwise arises from a statement derogatory to private character." It is on the same principle that a master is protected who, when called upon for the character of a servant, charges him with a theft. In such cases, in order to support an action, there must be proof of malice beyond the uttering of the words. With a view to preserving the freedom of domestic intercourse, and from a belief that the testimony of near relatives in favor of each other was worthless, and that the only effect of examining them against each other was to tempt them to commit perjury, it was formerly the habit to reject them as witnesses. The practice in England, for a long time, however, has been to admit, and even to exact their evidence, making allowance, in appreciating its value, for the circumstances in which they are placed. The same principle has latterly been followed in Scotland; and the only exceptions which have been retained by the law of evidence acts, 15 and 16 Vict. c. 27, 16 and 17 Vict. c. 20, to the now almost universal admissibility of witnesses, are, that neither the parties themselves, nor their husbands or wives, shall be competent or compellable to give evidence in criminal proceedings in which they are accused, nor to answer questions in a civil suit tending to criminate themselves or each other, or to reveal matters which they have communicated to each other during marriage. The C. of such communications remains although the marriage has been dissolved by death or divorce (Dickson, p. 924).

From very early times, so early, it is said, as the 4th and 5th centuries, the "seal of confession" (*sigillum confessionis*) was held to be inviolable, and no priest could be called upon, under any circumstances, to reveal facts which had been confided to him under its sanction. To this the case of treason was an exception, in England, even in Roman Catholic times (Best's *Law of Evidence*, p. 737). In Roman Catholic countries, the privileges of the confessional remain unaltered; and several of the Protestant churches of Germany having sanctioned the practice of confession, the privilege of secrecy has been extended to it, as a necessary consequence, by the civil power. In these states, however, in addition to imposing far lighter penalties upon those clergymen who shall break the seal, the duty of doing so is enforced in all cases in which the confession has reference to a future crime. In England, no special privilege whatever is extended to the Roman Catholic confessional; and the question as to how far a confession made to a clergyman for the purpose of obtaining spiritual comfort and consolation is protected, was long considered doubtful. The rule has, however, been settled for some time that no clergymen of any religious persuasion are entitled to the same privilege as legal advisers; though it has often been advocated as advisable to extend the rule to clergymen, including Roman Catholic priests. In Scotland, however, the point has never been directly or solemnly decided, evidence of the kind in question, when not indis

pensable for the ends of justice, being generally either withheld or withdrawn (Dickson, ii. p. 938). By a statute of the state of New York, U. S., ministers of the gospel, and priests of every denomination, are forbidden to disclose confessions made to them in their professional character; and a similar statute exists in Missouri. It has been decided in England, that communications to a medical man, even in the strictest professional confidence, are not protected from disclosure (Best, 734); and the same is the case in Scotland (Dickson, ii. p. 940); but a contrary rule has been adopted in several of the states of America (1 Greenl., § 248, note).

CONFIDENT PERSON. See INSOLVENCY.

CONFIRMA'TION, in English law, is where the party having right to land, grants to the party having possession that which is in him. C., in Scots law, is the form in which a title to administer is conferred on the executor of a person deceased. It must be gone through, or "expede," before the commissary of the district.

CONFIRMATION, a Latin word which signifies *strengthening*. In the ancient church, the rite so named was administered immediately after baptism, if the bishop happened to be present at the solemnity, which is still the custom in the Greek and African churches. In the Roman Catholic church, for the last 300 or 400 years, the bishops have interposed a delay of seven years after infant baptism; in the Lutheran church, the rite is usually delayed for from 13 to 16 years; and in the English church, from 14 to 18 years. There is, however, in the latter church no limit to the period. C. may be administered at an earlier period, if a family is about to emigrate; and persons are confirmed up to 60 or 70, if they choose. The ceremony consists in the imposition of hands by the bishop, accompanied by an invocation of the Holy Ghost as the comforter and strengthener. But both in the Lutheran and English churches, the ceremony is made the occasion of requiring from those who have been baptized in infancy, a renewal in their own persons of the baptismal vow made for them by their godfathers and godmothers, who are thereby released from their responsibility. None can partake of the Lord's supper, in these churches, unless they have been confirmed. In the Roman Catholic church, C. is held to be one of the seven sacraments, and in its administration, unction and the sign of the cross are used; and instead of the imposition of hands, the person confirmed receives a little blow on the cheek, to remind him that he must in future suffer affronts for the name of Christ. In the English thirty-nine articles, C. is declared not to be one of the sacraments, and the above ceremonies have been discontinued since the reformation.

CONFISCA'TION, forfeiture of lands or goods to the crown, as part of the punishment for certain crimes. See ESCHEAT.

CONFLICT OF LAWS. On the breaking up of the Roman empire into separate kingdoms, as many systems of jurisprudence, more or less dissimilar, arose, and were administered side by side. But owing to commercial intercourse and inter-marriage, many persons held property in more countries than one; many possessed two nationalities by birth, and more than two—if nationality could be acquired by residence and interest in a foreign state. In such circumstances, it often became an object of the utmost importance to individuals to ascertain, and of the greatest difficulty to lawyers to determine, whether the laws of one state or of another were to govern questions of sale, succession, status, and the like. As no state could vindicate its jurisdiction beyond its own boundaries, without being guilty of an act of aggression, it became absolutely indispensable that certain general rules should be fixed upon in order to prevent the danger of national hostilities on trifling occasions. The elaboration of these rules constituted a new branch of jurisprudence, to which the title of the C. of L. has been given, but which would be more accurately described as the rules for the solution of that conflict. From the partially independent character which belongs to the different states which constitute the American union, the labors of the continental jurists in international jurisprudence have been carefully adapted to the requirements of that country; and it is consequently to America and to continental Europe, rather than to the writers of our own country, that we must look for works of importance on this subject. By American writers, the term C. of L. has usually been confined to that branch of the law of nations which treats of the rights and duties of private individuals, and it is consequently synonymous with what elsewhere is called private international law, under which head its various rules will be enumerated in this work. See INTERNATIONAL LAW, PRIVATE; COMITY OF NATIONS. See Story's *Conflicts of Laws*.

CONFORMABLE STRA'TA are beds which lie parallel to each other.

CONFRONTÉ, in heraldry, means facing or fronting one another. It is the same as combatant.

CONFU'CIUS, a celebrated Chinese sage, was b. 19th June, 551 B.C., at Shang-ping, near the town of Tséuse, in the petty kingdom of Lu. His own name was Kong, but his disciples called him Kong-fu-tse (i.e., "Kong, the master or teacher"), which the Jesuit missionaries Latinized into Confucius. His mother used to call him Kéiu ("little hillock"), because he had an unusual elevation on the top of his forehead, with which he is often represented. Various prodigies, as in other instances, were, we are told, the

forerunners of his birth. An illustrious pedigree has also been invented for him by his fond disciples, who derive his origin from Hoang-ti, a mythological monarch of China who flourished more than 2,000 years B.C. His father, Shuh-leang-ho, died when C. was only three years of age, but he was very carefully brought up by his mother, Yan-she, and from his earliest years, displayed an extraordinary love of learning and veneration for the ancient laws of his country. The prudence, rectitude, and philosophic gravity of his conduct while a boy, are also highly extolled by Chinese writers. At the age of 17, he was made an inspector of the corn-marts, and distinguished himself by his industry and energy in repressing fraud, and introducing order and integrity into the whole business. When only 19, C. married, but divorced his wife four years after marriage, that he might have more time for study and the performance of his public duties. C. was next appointed inspector-general of pastures and flocks, and the result of his judicious measures, we are told, was a general improvement in the cultivation of the country and the condition of the people. The death of his mother, which happened in his 23d year, interrupted for a time his administrative functions, and gave occasion to the first solemn and important act of C. as a moral reformer. According to the ancient but then almost forgotten laws of China, children were obliged to resign all public employments on the death of either of their parents; and C., desirous of renewing the observance in his native land of all the practices of venerable antiquity, did not fail to conform to this long neglected enactment. The solemnity and splendor of the burial ceremony with which he honored the remains of his mother (another old custom which had fallen into disuse), struck his fellow-citizens with astonishment, and they determined, for the future, to bury their dead with the ancient honors. Their example was followed by the neighboring states, and the whole nation, except the poorest class, has continued the practice to the present day. C. now came to be looked upon as an authority in regard to the past, and ventured to speak as such. He inculcated the necessity of stated acts of homage and respect towards the dead, either at the grave, or in a part of the dwelling-house consecrated for the purpose. Hence, "the hall of ancestors," and anniversary feasts of the dead, which now distinguish China as a nation. C. did not end here. He shut himself up in his house to pass in solitude the three years of mourning for his mother, the whole of which time he dedicated to philosophical study. We are told that he reflected deeply on the eternal laws of morality, traced them to their source, imbued his mind with a sense of the duties which they impose indiscriminately on all men, and determined to make them the immutable rules of all his actions. Henceforth, his career is only an illustration of his ethical system. He commenced to instruct his countrymen in the precepts of morality, exhibiting in his own person all the virtues he inculcated on others. Gradually his disciples increased, as the practical character of his philosophy became more apparent. After his "years of mourning" and meditation were over, C. traveled through various states, in some of which he was employed as a public reformer. On his return to Lu, his reputation was very great, not less than 500 mandarins being among his followers. In fact, it is to be observed, that generally C.'s disciples were not the young and enthusiastic, but men of middle age, sober, grave, respectable, and occupying important public situations. This fact throws light both on the character and design of his philosophy. It was *ethical*, not *religious*, and aimed exclusively at fitting men for conducting themselves honorably and prudently in this life. C. now divided his scholars into four classes: to the first, he taught morals; to the second, rhetoric; to the third, politics; and to the fourth, the perfection of their style in written compositions. While residing at Lu C. worked industriously in the revision and abridgment of those works which constituted the principal monuments of that ancient literature about which he was always speaking in the language of unbounded reverence.

An unworthy change of magistrates, however, in the kingdom of Lu induced C. to recommence his travels. He first proceeded to Chen, where he was not much appreciated; and afterwards to Tze, where he became one of the king's ministers, but was dismissed after a short time through the intrigues of cunning courtiers. On his return to Lu, he was appointed "governor of the people." For a time, his inflexible virtue awed them into morality, and the delighted monarch conferred the highest dignities on the philosopher; but the arrival of a bevy of beautiful sirens from a neighboring state, which hated the increasing purity of Lu, suddenly overturned the edifice of morality which C. was constructing; and in despair, he again went abroad in search of less vacillating disciples. His later wanderings were very unpropitious; state after state refused to be improved. He was in some instances persecuted; once he was imprisoned, and nearly starved; and finally, seeing no hope of securing the favorable attention of the mass of his countrymen while alive, he returned in extreme poverty to his native state, and spent his last years in the composition of literary works by which posterity at least might be instructed. He died 479 B.C., in the 70th year of his age. Immediately after his death, and notwithstanding the general demoralization of his contemporaries, C. began to be venerated, and succeeding ages adorned his name with golden epithets. His family, which has continued to the present day, through more than 70 generations, in the very place where their ancestor lived, is distinguished by various honors and privileges, being the only example of hereditary aristocracy in China, while in every city down to those of the third order there is a temple to his

honor. The 18th day of the second moon is kept sacred by the Chinese as the anniversary of his death.

The system of C. is, rightly considered, the most faithful expression of the Chinese mind, although it is neither the oldest of the extant Chinese religions, nor that which can claim the greatest number of adherents. We have termed it a *religion*, but it ought rather to be regarded as a system of social and political life built upon a slight foundation of philosophy. It contains no trace of a personal God. There are, indeed, a number of allusions to a certain heavenly agency or power, *Shang-te*, whose outward emblem is *Tien*, or the visible firmament; but this Shang-te, in the opinion of the most enlightened Chinese scholars, is nothing more than a verbal personification of "the ever-present law and order and intelligence, which seem to breathe amid the wonderful activities of physical creation, in the measured circuit of the seasons, in the alternation of light and darkness, in the ebb and flow of tides, and in the harmonious and majestic revolutions of the heavenly bodies." Sometimes, indeed, C. uses language that might seem to imply more than this. In one of the sacred books, Shang-te is depicted as possessing a high measure of intelligence, and exercising some degree of moral government; he punishes the evil, rewards the good, and is honored with sacrifice. Immediately after, however, we are informed that his retinue consists of six Tsong, the mountains, the rivers, and the spirits generally. Elsewhere, the people are enjoined "to contribute with all their power to the worship of Shang-te, of celebrated mountains, of great rivers, and of the 'shin' (spirits) of the four quarters." Hence we are forced to the conclusion, that C. no more believed Shang-te to be a personal being, than he believed the mountains to be such; and that in describing this power as possessed of intelligence, and as exercising a moral government, he simply spoke in a pictorial and symbolic way of the laws that govern all things. Perhaps, too, a dim consciousness of a mysterious inexplicable *life* pervading the phenomena and operating through the laws of nature—a feeling probably absent from no human soul—influenced C. to use words which his understanding would not have interpreted in a very literal manner. His highest conception of God, therefore, only reminds one of the *anima mundi* of the classical philosophy; and even this conception is not always present. More than once, his language indicates doubt as to the existence of this great abstraction, and he occasionally "reprimanded his disciples for prying into matters unconnected with their duties and lying far beyond their depth." In fact, from metaphysics and theology he equally shrank. The idea of a creation out of nothing by an infinite and eternal person, to the end that the glory of his perfections might be seen and felt through the magnificence of material symbols by those intelligences whom in his beneficent condescension he had deigned to create, is utterly unknown to Confucius. He looked on the universe rather as a stupendous, self-sustaining mechanism. He thought that all things existed from eternity, and were subject to a flux and reflux, in obedience to initial laws impressed upon them, how and why, we know not, by some stern necessity. Thus, chaining to the earth, as it were, "those thoughts that wander through eternity;" crushing, in fact, every spiritual tendency of human nature, by repudiating all speculation, and well-nigh all philosophic investigation of every kind, C. strove to direct the attention of men to the duties of social and political life. "I teach you nothing," he says, "but what you might learn yourselves—viz., the observance of the three fundamental laws of relation between sovereign and subject, father and child, husband and wife; and the five capital virtues—universal charity, impartial justice, conformity to ceremonies and established usages, rectitude of heart and mind, and pure sincerity." This, in fact, contains the whole doctrine of C.; and it was unquestionably well suited to the prosaic, practical, and conservative mind of the Chinese. It was by the strict and faithful performance of appointed duties, and by the cultivation of proper feelings and sentiments, that C. believed wisdom or knowledge could alone be obtained. He seems to have entertained no doubt that the great virtues of charity, justice, and sincerity might be developed without the help of any spiritual or religious faith, by a species of mechanical discipline. They were natural to the mind, he thought, just as their opposites were unnatural. Here, again, we find a striking example of that easily satisfied unphilosophic *materialism* which characterized C., and has since leavened the Chinese nation so thoroughly. He virtually says: "Just as I am forced to accept the phenomena of the universe as *facts*, though I can give no explanation of their origin, so am I forced to accept the phenomena of the human mind as *facts*, though I can give no explanation of *their* origin." C. finds evil and good, wisdom and folly, in the hearts of men. He cannot help making this distinction; some things are bad, others good; such is the oracular utterance of his conscience, which he terms "the light of intelligence." He does not, however, advance a step further, and make this moral conviction the basis of a religion. His "good" has no connection with any God. It exists; we are forced to recognize it as such; that is all we can know. Cultivate it. Those great laws of nature about which we know nothing except that they are realities, are on its side. Do not foster what you know to be mean and unworthy, for "he who offends against heaven has no one to whom he can pray." "Imperial heaven will only assist virtue." From this stand-point, C. taught a simple and comprehensive rule of life, both private and public. First, let every man govern himself according to the sacred maxims; then his family according to the same; and finally, let him render to the emperor, who is the father of his people,

such filial obedience as he demands of his own children, and worship him with the same veneration as he does his own ancestors; for thus will domestic peace, social order, and the safety of the commonwealth be preserved. To further this end (and in accordance with his belief that by instruction in the sacred precepts everything desirable could be accomplished), C. inculcated the necessity of universal education, and, in consequence, schools are diffused throughout the length and breadth of the empire, penetrating even to the remotest villages, where the maxims of the philosopher are taught, whose influence is thus perpetuated from generation to generation.

Confucianism appeals to "practical" men. It lauds the present world; rather doubts, than otherwise, the existence of a future one; and calls upon all to cultivate such virtues as are seemly in citizens—industry, modesty, sobriety, gravity, decorum, and thoughtfulness. It also counsels men to take part in whatever religious services have been established from of old. "There may be some meaning in them, and they may affect your welfare in a way you do not know of. As for the genii and spirits, sacrifice to them: I have nothing to tell regarding them, whether they exist or not; but their worship is part of an august and awful ceremonial, which a wise man will not neglect or despise." Confucianism, in consequence, almost immediately after the death of its author, became the religion of the state, to which it has proved an admirable ally; its theory of government being nothing less than a paternal despotism. The entire literary class in China are also followers of C., and, in fact, for many ages the literature of China has consisted exclusively of commentaries on the five canonical books which C. professed to merely abridge, and of four others, which were composed partly by himself and partly by his disciples, and which, together with the former, constitute the nine Chinese classics.

The five canonical books are the *Yih-king*—originally a cosmological essay, now, curiously enough, regarded as a treatise on ethics; the *Shu-king*—a history of the deliberations between the emperors Yaou and Shun, and other personages, called by C. the *ancient kings*, and for whose maxims and actions he had the highest veneration; the *Shi-king*—a book of sacred songs, consisting of 311 poems, the best of which every well-educated Chinaman gets by heart; the *Le-king*—the book of rites, the foundation of Chinese manners, prescribing, as it does, the ceremonies to be observed in all the relationships of life, and the great cause of the unchangeableness and artificiality of Chinese habits; and the *Chun-tsien*—a history by C. of his own times, and those which immediately preceded him. The first of the "Four Books" is the *Ta-hëo*, or "Great Study," a political work, in which every kind of government, from the domestic to the imperial, is shown to be essentially the same—viz., parental; the second is *Chung-yung*, or "the Invariable in the Mean," a book devoted to teaching men what is "the due medium," or the golden mean, to observe in their conduct; the third is the *Lun-yu*, or "Philosophical Dialogues," containing the recorded conversations of C., and the best book for obtaining a correct knowledge of his character; and the fourth is the *Hi-tse*, written by Meng-tse, or Mencius, who died 317 B.C., and who was by far the greatest of the early Confucians. The main object of this work is to inculcate philanthropic government.

It is proper to observe, in conclusion, that in the course of centuries the defects of the system of C. made themselves felt even to the unspiritual Chinese mind; and the necessity of "speaking out far more plainly, not on matters of finance, economy, and etiquette, but on the nature of the world and its inhabitants, and the true relation of the seen and temporal to the absolute and the all-embracing, was recognized. The philosopher who guided this great movement to a prosperous close was Tehu-he (d. 1200 A.D.), is termed by European scholars the Chinese Aristotle, and regarded by all the governing class in China as "the prince of science." His innumerable works are laboriously studied by the higher literary class, and are considered the standard of metaphysical or religious orthodoxy, but the mass of ordinary Confucians never pass beyond the ceremonial ethics of their master.

For further information regarding Confucius and his system, see article CHINESE EMPIRE.

CONGAREE RIVER, in South Carolina, formed by the junction of the Broad and the Saluda about the middle of the state. After a course of 50 m. it unites with the Wateree, after which the two are called the Santee. The Congaree is therefore only 50 m. long. It is navigable for steamboats.

CONGÉ D'ÉLIRE (Norman-French), the name given in England to the king's warrant or permission to a dean and chapter to proceed to the election of a bishop to a vacant see. Since the passing of the statute 25 Henry VIII. c. 20, the C. d'É. has always been accompanied by a letter-missive from the king, mentioning the person to be elected by name, so that in reality it is a nomination by the crown. If the dean and chapter delay the election beyond twelve days, the nomination is effected by letters-patent from the crown; if they delay beyond twenty days, or elect another than the person named, they incur the penalties of a *præmunire*, i.e., loss of civil rights, forfeiture of their goods, and imprisonment during the royal pleasure.—Stephen's *Commentaries*, vol. iii. p. 8.

CONGENITAL DISEASES are such diseases as are acquired during the period of pregnancy. They are hereditary and non-hereditary. Among those which are hereditary are syphilis and some chronic skin diseases; and they may be inherited from either parent. The mother may also communicate small-pox and other acute skin diseases. Among the non-hereditary are congenital hernia, and hydrocephalus. In this connection may be mentioned malformations, such as double toes and fingers, which are hereditary, and other monstrosities non-hereditary.

CONGER, or CONGER-EEL, *Conger*, a genus of marine fishes of the eel family (*murænidæ*), having the tail more elongated and pointed than the fresh-water eels, the dorsal fin commencing much nearer the head, and the teeth of the upper jaw, although slender, placed so close together as to form a cutting edge. The species are not numerous. One only (*C. vulgaris*) is a native of the British seas. It is common on all parts of the coast, and is found both among rocks and on banks. Its form much resembles that of a fresh-water eel; its color is brown above, passing into dull white beneath; the fins whitish, edged with black; and the lateral line almost white. It attains a large size, often 5 or 6 ft. long, sometimes 10 ft., and 18 in. in circumference, weighing more than 100 lbs. It possesses great strength, and is a formidable antagonist when hauled into a boat by the fisherman's line, or found among the rocks, where it is sometimes left by the retiring tide. Great numbers are, however, taken in order to be used as food, although not highly esteemed, and chiefly consumed by the poorer classes. The principal C. fishery of Britain is on the Cornish coast, and it is not uncommon for a boat with three men to bring on shore from a ton to two tons as the produce of a night's fishing, the C. being caught most readily during the night; but there are banks off the French coast still more productive. Sand-launces, pilchards, etc., are used for bait. The C. is extremely voracious.

CONGESTION may be defined to be "excess of blood in the vessels of a part, with diminished motion of that blood." The chief causes of congestion may be classed under the two heads of (1) congestion from venous obstruction, and (2) congestion from want of tone in the vessels.

1. *Congestion from venous obstruction* is easily illustrated by tying up the arm, as is done before opening a vein, when the veins are compressed more than the arteries. If the ligature is kept on for a sufficient time, the veins swell, the fingers become red, and then livid, and the whole limb is swollen. Cold applied to the surface of the body acts similarly on it, and contracts the veins more rapidly than the arteries, which lie deeper; and the purple color of the hands and face after exposure to cold shows the congested state of the capillaries. "Congestions," says Dr. C. J. B. Williams, "are caused in external organs by an obstruction of the veins leading from them. Thus, congestion of the brain may be produced by a tight cravat or by a tumor pressing on the jugular veins. Efforts of straining, coughing, holding the breath, and asthmatic paroxysms which impede the flow of blood through the lungs, cause congestion in various parts. Tubercles in the lungs cause congestion of that organ. Obstruction to the transit of blood through the liver causes congestion in the abdomen, hemorrhoids, etc." —*Principles of Medicine*, 2d ed., p. 180.

2. *Congestion from want of tone in the vessels* includes a numerous class of cases. In atony of the vessels generally, as in extreme debility, certain fevers, etc., there is general congestion of the parenchymatous organs—the lungs, liver, etc.—and the blood gravitates to the lowest parts, giving rise to what is termed *hypostatic* congestion of the posterior parts of the lungs, the skin of the back, etc. In other cases, the weakness is local, as when the feet swell after long standing, in consequence of over-distention of the veins. Similarly, a continued stooping posture may occasion headache, giddiness, and the other symptoms of congestion of the brain. Congestive affections of this kind are often mistaken for inflammation, and instead of being treated by tonics, are treated by depletion, which, although affording temporary relief, increases the evil.

Another cause of congestion is over-excitement of the vessels, and this often occurs at an early stage of inflammation, or as a result of that process.

We must pass over the symptoms and effects of congestion, because they vary very much according to the organ affected, and shall conclude with a few words on the general remedies for congestion. First in order, we must notice such as remove the cause, as the loosening of a ligature, or the removal of a tumor compressing veins, elevation of the head in affected brain, and the recumbent position in congestion of the hemorrhoidal or uterine vessels. Pressure, by supporting the weak vessels, and friction, by increasing the onward movement of the blood in the veins, are often of great use. Astringents, such as solutions of alum, sulphate of zinc, tannin, oak-bark, etc., may be applied with advantage locally to certain parts, as the eye, throat, rectum, etc.; and stimulants may be similarly used, as a capsicum gargle to a relaxed sore-throat. Medicines of these classes may also be given internally. Thus, the principal action of bark, quinine, and arsenic in the cure of ague is supposed to lie in their reducing the great visceral congestion that is always present. A glass of strong hot brandy and water will often remove a congestive headache, and a stimulant draught will often relieve the pulmonary congestion which follows a fit of asthma. Various remedies are supposed to have a special power of removing the congestion of certain organs: thus, mercurials are recommended

for congestion of the liver; digitalis and cantharides for congestion of the kidneys; and squills, benzoin, and the balsams for bronchial congestion.—For further details, the reader is referred to the excellent work of Dr. Williams, from which we have quoted.

CONGESTION OF BLOOD, also called fullness of blood, vascular turgescence, hyperæmia (*hyper*, excess; *æma*, blood), is a condition to which probably far too much importance has been attached by medical writers. Congestions are described as being either *active* or *passive*. But active congestions are always essentially parts of a further morbid process, such as inflammation (q.v.), tumor (q.v.), or softening of texture; while passive congestions are almost always determined by some mechanical cause of obstructed or retarded circulation. It results from this view of its pathology, that congestion alone can hardly ever require treatment, or be anything else than one among other indications of disease.

CON'GLETON, a market t. in Cheshire, picturesquely situated in a deep valley, on the Dane, 33 m. e. of Chester. It is a mile long, with many houses built of wood and plaster, and silk spinning and throwing, with manufactures of silk ribbons, etc. There are coal-mines near. Pop. '71, 11,344.

CON'GLETON, HENRY BROOKE PARNELL, Lord, 1776–1842; son of John Parnell, chancellor of the Irish exchequer, and a descendant of Parnell the poet. For 35 years he represented Queen's co., Ireland, and Dundee, Scotland, in the English parliament. In 1841, he was made baron Congleton. He is the author of the *Principles of Currency and Exchange; The Penal Laws against Irish Catholics; Paper Money, Banking, and Over-Trading*, etc. He became insane and committed suicide.

CONGLOM'ERATE, or PLUM-PUDDING STONE, a rock consisting of round, water-worn pebbles, compacted together into stone. These pebbles consist of portions of hard rock, frequently of quartz. They can sometimes be traced to their parent rock. Their rubbing and polishing must have been a work of considerable time, but their deposition in the beds in which they occur has been performed speedily, the materials having been brought together by a strong current. They are united together by a silicious, calcareous, or ferruginous cement, sometimes so loosely that they are easily separated by a slight blow from a hammer; at other times, the matrix is as hard as the pebbles which it contains, and clasps them so firmly that the rock breaks, as if it were a homogeneous mass. The pebbles vary in size, occasionally being several feet in diameter; but they are generally about the size of, or smaller than a walnut.

CON'GO, in the widest sense of the name, includes all the countries on the w. coast of Africa lying between the equator and lat. 18° s.; but more definitely the name is given to the territory lying between the rivers Dando and Congo, or Zaire.—The great central African river, the Congo, which Stanley has proposed to call the *Livingstone*, has of late usurped much of the interest formerly reserved for the Nile and its exploration. At its mouth on the Atlantic seaboard the Congo is an immense body of water, near 10 m. wide and over 160 fathoms in depth. Its upper course remained unknown till Mr. Stanley identified the Congo with the Lualaba, and so connected it immediately with the great system of lakes s. and w. of lake Tanganyika, and less directly with Tanganyika (q.v.) itself. The former chain of lakes, examined by Livingstone in the hope that here he might finally fix the sources of the Nile, were long suspected to drain towards the Congo—a suspicion confirmed by Cameron. But Mr. Stanley and his followers, striking the Lualaba (known higher up as Chambezi and Luapula) at Nyangwe in Nov., 1876, followed its course persistently in the face of enormous difficulties, fighting no less than 32 battles; till in Aug., 1877, he found it, after "changing its name scores of times," reach the Atlantic as Congo, Kwango, and Zaire. The Lualaba-Congo, interrupted to the n. of Nyangwe by cataracts and rapids, flows northward from the lake region to about 2° n. of the equator (where it is already "a broad stream, from 2 to 10 m. wide, studded with islands"); then its course changes to n.w., w., and finally to s.w. "As the river runs through the great basin which lies between e. long. 26° and e. long. 17°, it has an uninterrupted course of 1400 m., with magnificent affluents, especially on the southern side. Thence, cleaving the broad belt of mountains between the great basin and the Atlantic ocean, it descends by about 30 falls and furious rapids to the great river between the falls of Yellala and the Atlantic."—The natives of the country of C. and the bordering lands speak one copious and harmonious negro-language; they are good-natured and hospitable, but very indolent. Their Christianity, early derived from Portuguese missionaries, is of the most superficial kind. The pop. in the interior is supposed to be dense.—See Burton's *Two Trips to Gorilla Land* (1876); Cameron's *Across Africa* (1877); and Stanley's *Dark Continent* (1878).

CONGOON', or KONGUN, a t. of Persia, on the Persian gulf, 130 m. s. of Shiraz. It has an excellent and safe roadstead; and both wood and water, which are generally scarce in the gulf, may be obtained here. Pop. 6,000.

CONGO SNAKE, found in the s.w. United States. It lives in muddy places and feeds on small fishes and insects. It is sometimes 28 in. long; blue-black above, tinged with violet, the under-side dark purple. It is amphibious, and not venomous.

CONGREGA'TION (Lat. *con*, together; *grex*, a flock), an assembly, generally a religious assembly; in its most ordinary use, an assembly of Christians met in one place for wor-

ship. See CHURCH.—In the Roman Catholic church, it often designates a sort of board of cardinals, prelates, and divines, to which is intrusted the management of some important branch of the affairs of the church. Thus the *C. of the Index* examines books and decides on their fitness for general perusal. See INDEX. The *C. De Propaganda Fide* consults as to the advancement of the Roman Catholic religion throughout the world. See PROPAGANDA. The *C. of Relics* inquires into the genuineness of supposed relics. The *C. of the Holy Office* takes cognizance of heresies, etc. See INQUISITION. The *C. of Rites* regulates the festivals and offices of new saints. There are numerous other congregations.

CONGREGATIONALISM (INDEPENDENTS, *ante*), a church polity according to which any congregation of believers, associated for Christian worship and work, mutual edification, and the maintenance of Christian ordinances, is a church of Christ, subject to no ecclesiastical authority, though bound by the law of Christ to be in fellowship especially with neighboring churches and generally with the whole body of believers. This system recognizes no church as statedly organized on any field wider than that of the local community. If in the administration of its affairs the interests of other churches seem involved, or if it have vainly sought to settle serious difficulties within itself, it seeks the advice of neighboring churches in a council; but it is not bound to follow such advice against its own deliberate and conscientious conviction of Christian duty. The cases are, however, very rare in which the decision of a council is not found to be practically self-enforcing by moral pressure. A member whose rights are invaded by the action of the church, may request the church to join with him in calling a council to consider the case; if his request be disregarded, he may call an *ex parte* council. A council is always limited strictly by the letter-missive which convenes it. That is its charter, and it has no functions as to any case or question not distinctly specified therein. Each Congregational church frames or adopts its summary of doctrines, in accordance with its own interpretation of the Scriptures, elects its own pastor and other officers, admits or rejects candidates for its membership, admonishes and rebukes offenders, and withdraws fellowship from them if they prove incorrigible. Every male member of full age has the right to vote in church affairs, and in some churches the right for women and minors to vote is admitted. The officers of a church are a pastor (usually the moderator in church meetings), and deacons in number as may be needed. A clerk, a treasurer, and needful committees may be appointed. The deacons serve at the communion table, care for the needy members, and are expected to aid the pastor in watching over all the interests of the brotherhood. In theory, their office involves the charge of the temporalities of the church, but practically their duties in this regard are in the hands of a board of trustees appointed by the "society," which provides for all the temporal affairs of the church. The deacons are elected sometimes for life, and sometimes for a period of time. The church has power to ordain its own minister if it see necessity so to do, but this is almost universally avoided as an irregularity, and when a pastor has been elected, his ordination is by a council of neighboring churches called for this purpose, and present by their pastors and delegates. The council examines the candidate as to his moral, spiritual, and intellectual qualifications, and, if it find him worthy, ordains or installs him by such religious services as to it may seem fit. These services usually embrace a sermon, a prayer of ordination, with laying on of hands, a charge to the pastor, with the right-hand of fellowship, and an address to the church and congregation. It occasionally happens that a council called to aid in the settlement of a minister fails to be satisfied with his fitness, and therefore declines to act in inducting him into office. In such cases the church, in its discretion, either relinquishes the candidate, or (very rarely), continuing him in the pulpit, takes upon itself the responsibility for whatever may be the effect of its action upon its standing and fellowship with other churches.

Congregationalism, like every other church polity, may be associated with any form of theological doctrine. The Baptist, Unitarian, Universalist, and some other denominations adopt the polity, though they do not take the name. The "Congregationalists" so called, and bearing this as their distinctive title, are clearly evangelical, and are deemed Calvinistic, though scarcely so except in a sense somewhat modified by modern thought. Their ecclesiastical polity, whose central principle is the independence of the local church under the law of Christ alone, tends to make subordinate questions of mere form or method, to keep open the path of free inquiry, and to foster the spirit of progress; while the moral influence of the great body of churches voluntarily associated in religious fellowship and for co-operation in Christian work, operates as a check, all the more powerful because unostentatious, upon hasty and ill-considered divergences from the old paths.

It is claimed by Congregationalists that their system of government is in complete accord with that of the apostolic age, and conformed to the genius and spirit of Christianity; but they do not trace it in direct historical line further back than the period of the Protestant reformation. Their theory is that Congregationalism is a return to the primitive order which had been rejected for the ecclesiasticism of Rome or of great national churches. John Robinson is generally regarded as the father of the system as revived in modern times, though doubtless he was only one of many founders. He was

prominent among those who sought refuge in Holland from the persecutions of the church of England. Settling first in Amsterdam in 1609, he and his little flock afterwards removed to Leyden, where, with constant longings for their native land, they tasted the sweets of religious liberty. Seeing no prospect that the persecution in England would cease in their time, and finding their situation not altogether pleasant among a people whose language and habits were different from their own, a large portion of the little company concluded to seek a permanent home in the wilderness of America. Having come to this resolution, they organized themselves as a church, and, with the blessing of their pastor, who expected to follow them at a later date, embarked on the *Mayflower* at Delft Haven in 1620. The little colony landed in Plymouth, on the coast of Massachusetts, where they laid the foundations of a church and state joined together after the pattern of the Jewish theocracy, and it was not until after the colonies became independent of England that the ties which bound the two were wholly severed. Robinson died before he could join the colony. The Plymouth church, formed in Holland, was the first in New England. The first church ever organized in New England was gathered at Salem, Mass., Aug. 6, 1629. The colonies of Massachusetts Bay, Connecticut, and New Haven were mainly composed, not of "Independents" like the Plymouth settlers, but of "Non-conformists," who did not at first contemplate a severance of their connection with the church of England, but sought chiefly the reform of that church in certain practices by them deemed idolatrous and popish. But the free air of the new world created in them a thirst for wider liberty, and the religious life of New England externally considered was soon molded to the form of Congregationalism. The idea of complete religious liberty, as now understood, was then hardly known in the world, certainly not accepted by any large party, and Congregationalism, wielding the civil authority, assumed for itself rights which it refused to dissenters. Thence the history of the colonial period of New England is not free from the stain of persecutions which no one at this day seeks to justify. Episcopalians, Baptists, Quakers, and others, felt the strong hand of civil and social proscription. The spirit of freedom, however, was even then working in the minds and hearts of many thoughtful men, and slowly preparing the way for the complete liberty of religious belief and worship which is now the glory of the republic. The whole spirit and tendency of Congregationalism is universally admitted to be at war with persecution in all its forms.

Congregationalists hold to no order in the ministry higher than that of the pastor of a local church. Religious fellowship among them finds expression in conferences formed of a number of churches in a given neighborhood, and meeting at stated times for worship, mutual edification, and the promotion of missionary and benevolent work; in state associations or conferences composed of ministers and laymen delegated by the smaller conferences, and meeting annually; and, finally, of late, in a national council, meeting once in three years—an addition to the system favored by many, but gravely distrusted by some. None of these bodies have the least ecclesiastical authority or power. In the Congregational system, the society or parish, composed of the pew-holders and worshipers, whether members of the church or not, acts concurrently with the church in the settlement and dismissal of a pastor, and elects the trustees in whom the law vests the management of the church property.

The forms of worship in Congregational churches are usually simple, varying, however, according to the taste of the pastor or the preferences of the congregation. There is general similarity, but no binding rule as to the parts or the order of service. Of late years the practice of responsive reading of selections from the Psalms, and of reciting in unison the Lord's prayer, is gaining favor. The ordinances observed are baptism and the Lord's supper. Infant baptism is generally practiced, but not strictly enforced. Persons baptized in infancy are admitted to the church like others with a public confession of Christ. The officiating minister, before the administration of the Lord's supper, usually invites other than members of the local church to partake, expressing such invitation not in any prescribed form, but in terms more or less strict according to his own views or those of the church. In most instances the invitation is confined to members of evangelical churches, or churches of Christ in good and regular standing; in others it is so broad as to include all who love and follow Christ, whether members of a church or not. Differences like this illustrate the freedom and elasticity of Congregationalism.

Until within the last 30 years Congregationalism was mainly confined to New England, making no effort for its own extension in the region beyond, and freely giving its force to the building up of other denominations; but it has recently made large advances in the states of the north-west, in those of the Pacific coast, and even in the middle and southern states. The number of state organizations is 31; of churches 3,620, with a total membership of 382,920; of ministers, 3,585. Benevolent contributions of the churches in 1879, so far as reported, $1,098,691.43; home expenditures, $2,594,228.81. The national co-operative societies of the Congregationalists are the American board of commissioners for foreign missions, the American home missionary society, the American missionary association, American Congregational union, Congregational publishing society, American college and educational society, the western education society, and the American Congregational association. Number of ordained

missionaries in foreign fields, 119. There are seven theological seminaries under Congregational control, with an aggregate of 298 students. The Congregational churches have always been noted for their high standard of ministerial education; and, during the present century, for their earnestness and liberality in the work of missions among the heathen.

CONGREGA'TIONALISTS. See INDEPENDENTS.

CONGRESS, an assembly either of sovereign princes, or of the delegated representatives of sovereign states, for the purpose of considering matters of international interest. Even in America, though the term has now a different meaning (see UNITED STATES), it had a similar origin, the first C. being that of the delegates from the various British colonies, who met on the 7th Oct., 1765, for the purpose of considering their grievances. In like manner, in Belgium, on the 4th Oct., 1830, a C. of deputies from the different provinces was held for the purpose of adjusting the new constitution. Previous to signing a treaty of peace, a meeting of plenipotentiaries usually takes place, to which the name of a C. is sometimes applied, though it seems more properly to be reserved for those more important meetings at which extensive schemes of future policy are determined on, and the balance of power amongst the various European states readjusted. To this class belonged the famous C. of Vienna in 1815; the C. of Carlsbad in 1819, for regulating the affairs of Germany; the Paris C. at the termination of the Russian war of 1854–56; the memorable C. at Berlin after the Russo-Turkish war of 1877–78; and many others. As the envoys to a C. are not sent to one sovereign in particular, a modification of the ceremonial recognized by the law of nations for the recognition of ambassadors takes place. There is no presentation of credentials, but in place of it an exchange of the full powers or warrants of the respective members. If a mediator has been appointed, it is to him that the letters of credence, and notes and counter-notes, are addressed, and by him that the negotiations are directed. There is scarcely any difference between a C. and a diplomatic conference—such, for example, as that of London in 1826, for determining the fate of Greece.

CONGRESS, UNITED STATES, the only legislative body of the nation, is composed of two houses: the senate, having two members from each state; and the house of representatives, having a membership based on population (see APPORTIONMENT BILLS), though every state must have at least one member. Senators are chosen by the state legislatures, the two houses of a legislature holding a joint meeting or jointly voting on the same day; elections are by ballot; senators must be at least 30 years of age on taking their seats, and their term of office is six years. There being now (1880) 38 states, there are 76 senators. They are paid $10,000 a year with a small allowance for stationery and mileage. The vice-president of the United States is the presiding officer of the senate, but he has no vote unless in the case of a tie. The senate has equal power with the house in legislation, except that bills for revenue purposes must originate in the latter body. The senate has the sole power of trying impeachments. When the president is impeached, the chief-justice of the United States supreme court must preside, and the vote of two thirds of the senators present is requisite to a verdict of conviction. The house of representatives now consists of 293 members, in the following numbers from the several states: New York 33, Pennsylvania 27, Ohio 20, Illinois 19, Indiana and Missouri 13 each, Massachusetts 11, Kentucky and Tennessee 10 each, Georgia, Iowa, Michigan, and Virginia, 9 each; Alabama, North Carolina, and Wisconsin, 8 each; New Jersey 7; Louisiana, Maryland, Mississippi, and Texas, 6 each; Arkansas, California, and Connecticut, 4 each; Kansas, Minnesota, Vermont, West Virginia, and New Hampshire, 3 each; Florida and Rhode Island, 2 each; Colorado, Delaware, Nebraska, Nevada, and Oregon, 1 each. The apportionment to follow the census of 1880 will greatly change these numbers; the states w. of Ohio will have a very large increase, while the southern states must lose heavily, and some of the eastern states also may lose. Members of the house are chosen in separate districts by popular vote, and their term is two years. The house elects one of its number to be speaker, or presiding officer. The course of legislation need not be explained. In case of a veto by the president, it requires a two-thirds vote in each house to re-enact the bill. Members of the house must be 25 years old. They are paid the same as senators. The whole number of members of the house has been regulated by the decennial apportionments as follows: In 1789, 65 members; in 1793, 105; 1803, 141; 1813, 181; 1823, 213; 1833, 240; 1843, 223; 1853, 234; 1863, 243; 1873, 293. Under the first apportionment there was one member to 30,000 citizens; under the last, one member to 131,425.

CON'GREVE, WILLIAM, the second son of Richard Congreve, esq., of Congreve and Stretton, was born about 1672, at Bardsey, Yorkshire. Educated at Kilkenny, and at Trinity College, Dublin, he in 1688 returned to England, and was entered at the middle temple, but he dose not seem to have taken kindly to law. His first publication was a novel, entitled *Incognita, or Love and Duty Reconciled*, a performance which Dr. Johnson said he would rather praise than read, but which has been neither read nor praised by succeeding critics. His first play, *The Old Bachelor*, was produced at Drury Lane, when C. was in his 19th year, and its success was remarkable. Next year he came out with *The Double Dealer*, which was a comparative failure; but his comedy *Love for Love*, published in 1695, was a great success, and brought to its author money

and fame. *The Mourning Bride*, a blank-verse tragedy, written after the manner of the old passionate masters, came out in 1697. Its success was enormous, far exceeding that of his comedies, but it has long since fallen from its high estate. Two years after, he produced his comedy, entitled *The Way of the World*,, which failed completely, and disgusted him with the theater. In other respects, C. was a fortunate man. He held various offices, which together yielded him an income of £1200. C. affected to despise his theatrical triumphs, and cultivated the modish airs of the fine gentleman, an eccentricity which laid him open to rebuke when he was visited by Voltaire. In his later days, he was afflicted by gout and blindness. He died 19th of Jan., 1729, at his house at Surrey street, in the Strand, London, at the age of 57, and was buried in Westminster Abbey, nobles supporting the pall.

As a writer of comedies, C. takes a high place, but not the highest. His plots are intricate and confused, and his dialogue is defiled by all the grossness of his age. He has none of those touches of nature that make the whole world kin. The element in which he moves is intrigue. His world is composed of wives, gallants, and husbands; and the wives and the gallants are in a continued conspiracy against the husbands. What strikes the reader of these plays, is the superabundant wit. But there is no discrimination or keeping in the brilliancy. The shoeblack is as witty as the hero. C. has so many good things to say, that he is glad to get a mouth to stick them in. He is the wittiest and the least amusing of writers. He has no heart, no generosity, no humor. His splendor is frosty, and the innumerable flashing points dazzle the eye, and make the brain ache.

CONGREVE, Sir WILLIAM, 1772–1828; the inventor of the congreve rocket, a native of Staffordshire, Eng. He had a commission in the artillery, and became lieut.gen. He was also a member of parliament, and author of an "*Elementary Treatise on the Mounting of Naval Ordnance*, and a *Description of the Hydro-pneumatic Lock.*

CONGREVE ROCKET. See ROCKET.

CONGRUOUS. In geometry, the term congruity is applied to lines and figures which exactly correspond when laid over one another. See COINCIDENCE.

In arithmetic, two numbers are said to be C., with respect to a third, when their difference is exactly divisible by it. Thus, 12 and 7 are C. with respect to 5, as

$$\frac{12-7}{5} = 1, \text{ and so are } 27 \text{ and } 12, \text{ as } \frac{27-12}{5} = 3.$$

The numbers considered must be whole numbers. When two numbers are C. to a third, either is called a *residual* of the other with respect to the third. C. numbers possess many curious properties, which have been applied by Gauss and other writers in the investigation of the properties of numbers.

CO'NI, or CUNEO, a province of Piedmont, Italy, on the French border; 2,656 sq.m.; pop. '72, 618,232. The surface is about equally divided between plains and hills. The province is watered by streams that run into the Po. The chief productions are wheat, corn, hemp, rice, and silk. The capital is the city of the same name.

CO'NI, or CUNE'O, capital of a province of the same name in the kingdom of Italy, stands at the junction of the Stura and the Gesso, in a pleasant, fruitful, and well-cultivated district, 48 m. s.w. of Turin. Pop. '71, 11,860. The principal street is handsome, with arched piazzas; and there are several large churches, convents, and palaces. Its chief manufactures are silk and woolen cloth. Owing to its position on the road between Nice and Turin, it enjoys a brisk traffic, and is the entrepôt for merchandise from Nice destined for Lombardy, Switzerland, and Germany. Two well-frequented fairs are held. C. was once a fortified place, and had to undergo several sieges. After being taken and retaken, the victory of Marengo gave it into the hands of the French, who demolished the fortifications, and turned them into promenades.

CONIC SECTIONS. See CONE, CIRCLE, ELLIPSE, PARABOLA, and HYPERBOLA.

CONIFERÆ (Lat. cone-bearers), an important natural order of exogenous plants, containing the pines, firs, juniper, yew, etc.; agreeing with the other exogenous orders generally in the structure of the stem and in the mode of vegetation, but differing remarkably from most of them in having naked ovules—i.e., ovules which are not enclosed in an ovary, but are fertilised by the direct application of the pollen to the *foramen*, without the intervention of style or stigma—and upon this account separated from them, along with *cycadaceæ* (q.v.), by Lindley, Endicher, and others, as a distinct class, under the name *gymnogens gymnospermæ*. The flowers are unisexual, the male and female sometimes on the same, sometimes on separate plants; the male flowers have either one stamen or one bundle of stamens, the anthers often crested; the female flowers are in cones or solitary; the place of ovaries is supplied by the flat scales of the cones, the ovules are usually in pairs on the face of the scales, either inverted or erect. The fruit is either a cone—the scales of which sometimes become fleshy, and are incorporated into a berry-like fruit—or a solitary naked seed. The seed has a hard crustaceous integument; the embryo is in the midst of fleshy, oily albumen; the cotyledons are either two, or numerous and whorled. The mode of branching is peculiar, numerous buds proceeding from the side of the main stem, so as generally to form whorls of

branches, which are generally almost horizontal in their direction, whilst the central vertical shoot runs up often with admirable straightness, and some of the C. attain a height unrivaled among other forest-trees, of which the *Wellingtonia* (q.v.) of California affords the most noble example. The wood consists of *punctated* cells; the sides of the tubes or elongated cells which form it, and which are nearly of equal diameter, being marked by circular disks, which, when highly magnified, exhibit a small internal circle surrounded by a larger external one. This peculiarity of the wood of the C. is important, as enabling us to recognize it in a fossil state, and to refer many fossils, particularly of the coal formation, to this order. The leaves of the C. differ very widely from those of the closely allied order *cycadaceæ*. Most of the C. have very narrow veinless leaves, so that the Germans call them *needle-woods* (Nadelhölzer) in contradistinction to the other European forest-trees, which they call *leaf-woods* (Laubhölzer). By far the greater number of them belong to the northern hemisphere. The C. are very long-lived; some of them are supposed to be capable of attaining an age of 2,000 or 3,000 years. When the stem of a coniferous tree is cut across, it does not sprout again from the root. The C., besides the great usefulness of the timber of many, are remarkably productive of turpentines (q.v.) and resins (q.v.). Astringent substances are also found in their bark, and fixed oil in their seeds. The seeds of some species of *pine* and *araucaria* are used as food.

The C. are divided into—1. *Abietineæ*, having inverted ovules and woody cones, as the pines, firs, larch, cedar, araucaria, etc. 2. *Cupressineæ*, with erect ovules, and either woody or fleshy cones, as the juniper, arbor-vitæ, cypress, etc. 3. *Taxineæ*, with solitary seeds, as the yew, gingko, etc. 4. *Gnetaceæ*, plants of comparatively humble growth, with jointed stems, often regarded as forming a distinct order. See SEA-GRAPE. Lindley and others also make the *taxineæ* a distinct order. See YEW.

CO'NIINE, or CONINE, an alkaloid constituting the poisonous principle of poison hemlock; formula, $C_8H_{15}N$. It is an oily liquid, specific gravity 0.89, boiling at 338° F. It has a penetrating and repulsive odor, and a sharp taste. It is easily soluble in alcohol and ether, but slightly so in water. Its action is that of an acrid narcotic poison. In common with the seeds and leaves of the plant, the alkaloid is used in pharmacy as a narcotic.

CON'INGTON, JOHN, 1825-69; a native of Lincolnshire, Eng., remarkable for precocity, knowing the letters of the alphabet when he was but 14 mos. old, and reading well at 3½ years. He was educated at Oxford, and in 1854 was appointed to the newly founded chair of Latin literature in Corpus Christi college. Among his works were translations of the *Agamemnon* and the *Choephori* of Eschylus; Virgil's *Eclogues and Georgics;* the *Odes of Horace;* Virgil's *Eneid;* the 12 last books of the *Iliad;* and the *Ars Poetica* of Horace.

CONIROS'TRES, a tribe or section of the order of birds called *insessores*, and characterized by a strong conical bill, without notches. The feet are, in general, adapted for walking on the ground, as well as for perching. The bill varies much in its thickness, and those species in which it is thickest, in general feed most exclusively on seeds. The number of birds belonging to this tribe is very great; and the families differ much in many respects. Among them are finches, sparrows, buntings, linnets, larks, plantain-eaters, colies, crows, birds-of-paradise, starlings, and even hornbills.

CO'NIUM. See HEMLOCK.

CONJUGAL RIGHTS. See MARRIAGE.

CONJUGA'TION (Lat. a connecting or yoking together), a term in grammar applied to a connected view or statement of the changes of form that a verb (q.v.) undergoes in its various relations. See INFLECTION. The forms usually included under this term are those that serve to mark: 1. *Person*, or the distinction between the speaker, the spoken-to, and the spoken-about; as (I) *write*, (thou) *writest*, (he) *writes*. 2. *Number;* as (John) *writes*, (they) *write*. 3. *Tense*, or time; as (I) *write, wrote, have written, will write*. 4. *Mood*, or the manner in which the action is presented. When the action is simply asserted, it is the indicative mood, as (he) *wrote;* when put as a supposition or condition, it is the conditional mood, as, *if he wrote*. The potential mood expresses the power of doing the action, as, *he can write;* and the imperative commands the doing of it—*write*. The infinitive mood expresses the action without limitation of any kind—*to write;* as it makes no affirmation, it is, strictly speaking, not a verb, but a kind of abstract noun. The two participles, the one expressing the action as in progress (*writing*), the other as completed (*written*), may be classed with the infinitive, as not affirming anything. In opposition to the infinitive and the participles, the other parts of the verb are called finite. 5. *Voice*, or distinction between active and passive (see VERB); as (he) *wrote* (the letter), (the letter) *was written* (by him).

In English, and in most modern Eurepean languages, the greater part of those distinctions are indicated by separate words; in Sanscrit, Greek, and Latin, they were nearly all indicated by prefixes and affixes, or other modifications of the word itself. The nature and origin of these modifications are considered under the head INFLECTION. All verbs do not take the same changes even in the same language. Although the affixes, e.g., may have originally been the same, yet they underwent, in course of

time, different kinds of corruption or obliteration, depending upon the nature of the letters in the root verb. This leads to the verbs of a language being arranged in different classes or conjugations. In Latin, for instance, grammarians recognize four conjugations, and verbs that cannot be brought into any class are called irregular verbs.

In English, there are two distinct types of the inflection of verbs; thus, *I love*, becomes in the past tense, *I loved*, and in the passive voice, *I am loved;* while *he shakes* becomes *he shook*, and *he was shaken*. Verbs that, like *love*, take *d* (or *ed*—sometimes *t*) in their past tense and past participle, form one class or C.; and those resembling *shake* in their changes form another. The former class is by far the most numerous; but the latter includes the most commonly used and oldest verbs in the language. The mode of change seen in *shake, shook, shaken*, is believed to be more ancient than the other, and is therefore called the old C., and sometimes the strong C., the other being the new or weak. The verbs belonging to the old C. are all of Saxon origin, and are primitive or root verbs; while derivative verbs belong to the other class. Verbs of the weak C. are pretty uniform in taking *d* or *ed*, although after certain letters the *d* is of necessity pronounced as *t*, and is sometimes replaced by that letter in writing—*dipt*. With regard to verbs of the strong C., no rule can be given as to the change of vowel by which the past tense is formed. It was made at first, no doubt, according to felt laws of euphony; and even yet a certain "method" may be discerned "in their madness." Thus:

1. Rise, rose; smite, smote; ride, rode; drive, drove, etc.
2. Cleave, clove; steal, stole; speak, spoke; tear, tore, etc.
3. Swim, swam or swum; sing, sang or sung; ring, rang or rung, etc.

For further information on the C. of English verbs, see Latham's *English Language*, or Chambers's *Information for the People* (ed. 1874), vol. ii., art. "English Grammar."

CONJUGATION OF CELLS, a union of two distinct cells of a plant, in order to reproduction. It has been observed only in the *conferveæ* and *diatomaceæ*. Two cells come into contact, as by two filaments of a *conferva* being brought together, and little projections are formed from each, the points of which are absorbed, and thus a tube is formed, through which one of the cells empties itself into the other. The latter then becomes a *mother-cell*, and produces spores.

CONJUNCT AND CONFIDENT. See INSOLVENCY.

CONJUNCTION, in astronomy, is one of the aspects (q. v.) of the planets. Two heavenly bodies are in C. when they have the same longitude—that is, when the same perpendicular to the ecliptic passes through both. If they have, at the same time, the same latitude—that is, if they are both equally far n. or s. of the ecliptic—they appear from the earth to be in the same spot of the heavens, and to cover one another. The sun and moon are in C. at the period of new moon. In the case of the inferior planets, Mercury and Venus, there is an inferior C. when the planet is between the earth and the sun, and a superior when the sun is between the earth and the planet. In general, a heavenly body is in C. with the sun when it is on the same side of the earth and in a line with him; and it is in *opposition* to the sun when it is on the opposite side of the earth, the earth being in a line between it and the sun. Planets are invisible when in C. with the sun, except in rare cases when an inferior planet passes over the sun's disk, and may be seen as a speck on his surface. Conjunctions are either *geocentric* or *heliocentric*, according as they are actually witnessed from the earth, or as they would be witnessed if observed from the sun. In observing a C. from the earth's surface, it is usual to reduce the observation to what it would be if made from the earth's center. By this means, the exact times of C. are more accurately fixed, and the observations of one astronomer made available to every other, wherever he may be on the earth's surface. *Grand conjunctions* are those where several stars or planets are found together. The Chinese history records one in the reign of the emperor Tchuen-hiu (2514–2436 B.C.), which astronomers calculate to have actually taken place.

CONJUNCTIONS, one of the "parts of speech," or classes, into which grammarians divide words. C. serve the purpose of connecting sentences, parts of sentences, and single words; as "Day ends, *and* night begins. William *and* John learn Latin. Charles *and* James carried the basket between them." In the first sentence, *and* connects two separate affirmations into one compound sentence. The same is true in the second—the separate affirmations being "William learns Latin," and "John learns Latin." In the third sentence, *and* connects only the two words, "Charles" and "James," as it cannot be affirmed of either of them alone that he "carried the basket." In most cases, however, it can be shown that, logically at least, two affirmations are involved, and that the conjunction really connects the affirmations. It is not easy to distinguish C. from adverbs. In fact, C. were all originally other parts of speech; and the greater part of them are still really adverbs, and owe their conjunctive effect to their signification as adverbs. In *and* and *but*, whatever may have been the original meaning, we now attend only to the conjunctive effect; *or* is a shortened form of the pronominal adjective *other;* and *nor* is *or* with the negative prefixed. In such a sentence as, "I believe that you are wrong," *that* is the demonstrative pronoun, equivalent to—I believe *this*, viz., "you are wrong." This is clearly seen in the corresponding words in other

languages: Ger. *dass*, Fr. *que*, Lat. *quod* (for the relatives were originally demonstrative pronouns). All the rest might be called adverbial C. or conjunctive adverbs. Ex., "He is industrious; *therefore* he is happy"—that is, "he is happy *for that*." This adverb, or adverbial phrase, expressive of the cause of the happiness, by referring us back for its meaning to the former assertion, has the effect of connecting the two assertions in the mind. Again, "The messenger arrived *while* he was speaking." Here *while* is equivalent to *at the time at which* (he was speaking). As an adverbial phrase, this simply indicates the time of the act of "arriving;" but as it also expresses that the speaking was going on at the same time, it thus conjoins the two assertions.

The most important distinction among C. will be seen in the following pair of sentences:

The sun went down, *and* the moon rose.
The moon rose, *as* the sun went down.

The first (compound) sentence contains two simple sentences or assertions, linked together, yet each standing on an independent footing; the two are joined on terms of equality, and are therefore said to be *co-ordinate*, and the conjunction is called a co-ordinating conjunction. In the second sentence, the last clause, though a grammatical sentence, contains no logical proposition, no assertion made for its own sake, but merely states a fact as a modifying circumstance with regard to the assertion contained in the first clause. The sentence of the second clause is therefore *subordinate* to that of the first, and the conjunction that marks the relation, a subordinating conjunction. The chief co-ordinating C. are:

1. *And, also, likewise, not only—but, partly—partly, first—then, further.* All these are used to tack on sentences whose sense accords with, or adds to, the effect of what goes before. Hence they might be called *cumulative* conjunctions. The following (2) mark various degrees of opposition in the sense or effect of the sentences, and might be called *adversative* conjunctions. These terms seem preferable to *conjunctive* and *disjunctive*, generally used.

2. (*a.*) *Not—but, else, otherwise* (exclusive).
   (*b.*) *Either—or, neither—nor* (alternative).
   (*c.*) *But, only, yet, still, at the same time, nevertheless.*

3. *Therefore, wherefore, for, thus, consequently, hence, accordingly, so, so that.* (Cause and effect.)

All other C. may be classed as subordinating, such being their usual function. Those in most common use are: *Although, as, as well as, so—as, as—as, because, if, lest, since, than, that, in order that, though, unless, whether, when, before, after, while.*

CONJUNCTLY AND **SEVERALLY**, in the law of Scotland, corresponds to jointly and severally in England, and denotes a form of obligation by which each of several obligants becomes bound for the whole. The creditor in such circumstances has his option either to exact the obligation proportionately from each of the co-obligants, or to select one of them, and exact the whole from him, leaving him to seek his relief against the others.

CONJURING. See MAGIC, INCANTATION.

CONKLING, ROSCOE, b. in Albany, N. Y., Oct. 30, 1829. He was bred to the law, and settled in Utica in 1846. Twelve years afterwards he was chosen mayor of the city. In the same year he was elected a member of congress, and was returned three time afterwards, serving in the house from 1861 to 1867. In 1867, he was elected U. S. senator, and re-elected in 1879. He is a remarkably facile and commanding orator, and has for several years been the recognized leader of the republican party in the state.

CONN, LOUGH, a lake in the n. of Mayo co., Ireland, and with Lough Cullin (from which it is separated by a narrow neck of land), 13 m. long, and 1 to 3 broad. It lies in a wild romantic region of hills, glens, rocky slopes, precipices, broken ground, and bogs. It contains isles, has bold shores, and is 40 ft. above the sea.

CONNARA'CËÆ, a natural order of dicotyledonous or exogenous plants, consisting of trees and shrubs, sometimes climbing, with compound alternate leaves, destitute of stipules; the flowers in racemes or panicles. Resinous juices do not occur in this order. Forty or fifty species are known, all tropical. The best known product of this order is the beautiful wood called ZEBRA WOOD, the wood of a large tree which grows in Guiana, *omphalobium lamberti*. The fruit of some species of *omphalobium* is eaten; the eatable part is the fleshy aril.

CON'NAUGHT, the westmost and smallest of the four province sof Ireland. It is bounded n. and w. by the Atlantic; e. by Ulster and Leinster, from the latter of which it is separated by the Shannon; and s. by Munster. It contains the counties of Galway, Leitrim, Mayo, Roscommon, and Sligo. Greatest length from n. to s., 105 m.; greatest breadth, not including Achil island, 92 miles. Area, 6,863 sq. miles. Along the w. coast are manfine bay ys and harbors. The country, especially in the w., is mountainous and rugged, remarkably grand and picturesque. (For detailed information, see the respective counties.) The people are still almost purely Celtic. In the times of the Irish pentarchy, the O'Connors were kings of Connaught. In 1590, the province was divided into six counties, the five above mentioned, with Clare (which was afterwards

joined to Munster). It then lost its independence, and came under English administration. From famine and emigration, the pop. of C. have been diminished by more than one third since 1841. It was, in 1841, 1,420,705; in 1851, 1,012,479; in 1861, 919,135; and in 1871, only 846,213.

CONNEAUT', a village in Ashtabula co., Ohio, 2 m. s. of lake Erie near the Pennsylvania line; pop. '70, 1163. There is a good harbor on the lake, and the Lake Shore railroad passes through the village. Conneaut is noted as the landing place of the first white settlers of northern Ohio, in 1796.

CONNECTICUT, the largest river to the e. of the Hudson in the United States, rises on the s. border of Lower Canada, near lat. 45° n., and, after a fall of 1600 ft. and a s.s.w. course of at least 400 m., enters Long Island sound in lat. 41° 16′ north. With the exception of the state of Maine, it may be said to be the chief artery of the whole of New England, separating New Hampshire on the e. from Vermont on the w., and afterwards crossing successively Massachusetts and the state of its own name. It is navigable up to Hartford, a distance of 50 m., for a draught of 8 ft.; and up to Middletown, which is 16 m. nearer the sea, for a draught of 10 ft.; while, with a few subsidiary canals, it carries barges of 8 or 10 tons fully 200 m. above the former city. The C. has many alluvial intervals on its banks, which, being generally inundated in the spring, are remarkable for their fertility. The stream is famous both for the quantity and the quality of its shad; and its valley, about 40 m. wide, presents a considerable variety of romantic scenery.

CONNECTICUT, the most south-westerly state of New England in the United States, and one of the original members of the great confederacy, is situated in lat. 41° to 42° 3′ n., and long. 71° 55′ to 73° 50′ west. Area, 4,750 sq. miles. Between 1790 and 1870, the inhabitants had increased from 238,141 to 537,454—being on the average an advance of barely 1⅛ per cent per annum. A result so anomalous, where the general population doubles itself in a quarter of a century, is creditably explained by the fact that to all the new states of the union C. has uniformly been a nursery of educated men of every class —of merchants and agriculturists, of lawyers and statesmen. According to the census of 1870, the state, besides its two senators in the upper house of congress, sends four representatives to the lower, appointing, as the sum of both, six presidential electors. Under the existing constitution, which superseded the charter of Charles II. only in 1818, the local authorities are a governor, a lieutenant-governor, a senate of 18 to 24 members, an assembly of 237 representatives, and a supreme court. Between 1850 and 1870, the assessed value of taxable property, personal as well as real, appears to have risen from $119,088,672 to $425,433,237. Respectively to the w. and e. of Connecticut river are the Housatonic and the Thames, of which the former is navigable 12 m. upwards, and the latter 14. Many smaller streams afford valuable water-power. Besides the New Haven and Farmington canal, 16 m. in length, C. is traversed in almost every direction by railways. The chief towns are Hartford, New Haven, Bridgeport, New London, and Norwich—the second and fourth being the principal ports, and all of them being accessible from the sea. The colleges are three in number; and the schools of every grade may stand a comparison with any in the union. The soil is better fitted for pasturage than for tillage. The minerals are iron, plumbago, marble, and freestone. The staple productions are butter, cheese, wool, maize, oats, barley, wheat, flax, hemp, tobacco, and cider. There are 111 establishments for the manufacture of cotton goods, the products of which in 1870 amounted in value to $14,026,334, a total exceeded by only four other states in the union.

CONNECTICUT (*ante*), (from the Indian name of the river, Quon-ek-ta-kot, meaning "long river"); one of the original 13 states. The region was first explored by the Dutch from New Amsterdam (New York), but they made no settlement until 1633, when they built a fort called the "house of hope," on the site of the present city of Hartford, purchasing the land from the Indians. An English patent covering all the territory n. and s. from some distance above Montreal to near Philadelphia, and running from the Atlantic ocean westward an indefinite distance to the "great south sea," had been granted in 1620 to the New England proprietors, and these proprietors in 1631 made a grant of territory 120 m. wide along the coast from Narragansett river s. toward Virginia and w. to the Pacific. When the English undertook to settle in 1633, the Dutch threatened war, but finally sold them the "house of hope," and Connecticut became freely opened to the New Englanders, who made their first permanent stand at Wethersfield in 1636, though a small party of them had previously established a trading-house at Windsor. In 1638, Rev. John Davenport led a company of emigrants and settled at New Haven, and very soon there were white settlements at Hartford, Windsor, Saybrook, and some other places. In 1657, the new towns threw off the New England government and set up for themselves, and the next year the New Haven colony joined the others. In the same year there was a short war with the Pequot Indians, who were defeated, and the tribe completely broken up. In 1662, a new charter was granted to John Winthrop by Charles II., and very soon all the settlements were united under one government, New Haven, however, standing out for a considerable period. We should mention that as early as 1639, a constitution had been adopted at Hartford, now referred to as "the first one written out as a complete form of civil order in the new world, and embody-

ing all the essential features of the constitutions of the American states, and of the republic itself, as they exist at the present day." Under this constitution, until 1661, the only recognized authority was the supreme power of the commonwealth, and the people were practically independent. The charter granted by Charles II. was so near to our system of government that no important changes were needed when Connecticut became a member of the union—in fact, the organic law of the first settlers was not much altered until the adoption of a new constitution by the state in 1818. James II. made strenuous efforts to revoke all the New England charters, and in 1687, sir Edmund Andros, whom James had made governor of all New England and New York, appeared in Hartford during the session of the assembly and demanded the desired document; but upon search it was not to be found, and is believed to have been hidden away in the hollow of a tree which was famous afterward as the "charter oak." James was driven from the throne in 1689, and the Connecticut colonial government renewed its complete authority.

From the union of the early settlements until 1701, Hartford was the seat of government; after that New Haven shared the honor; and the law making both state capitals continued until 1874, the legislature meeting twice in each year, in May in one city and in Oct. in the other, until 1818, and then yearly in the cities alternately until 1874, when, by vote of the people, Hartford was made the legal capital. The colony was active in the early Indian and the French wars, and among the most zealous in the war of the revolution, its legislature having early in June, 1776, instructed its delegates in the continental congress to propose, in substance, the famous declaration that was made on the 4th of July. The settlers of Connecticut were mainly Puritans, and had all the religious earnestness of their age. Though they did not go to the extreme of burning witches and persecuting Quakers, their laws were strict, of which occasion was taken to attribute to them the whimsical code known as the "blue laws," a code which never existed except in a malignant history written by Samuel Peters, an Episcopal minister who adhered to the tories during the revolution. During the revolution, gen. Washington relied much upon Jonathan Trumbull, then governor of the colony, a wise and excellent counselor, whom Washington addressed as "Brother Jonathan." Reminiscences of the original grants to Connecticut long remained. The extension westward to the "great southern ocean," gave Connecticut a strip of land 60 m. wide to the Pacific; and these claims were recognized in western New York and northern Ohio, but long before the land became of great value, amicable arrangements were made and the claims of Connecticut were relinquished. The portion in Ohio was over 3,600,000 acres, and is still known as the "western reserve." During the second war with Great Britain, Connecticut was the stronghold of those who opposed the war, and the "Hartford convention," held by leading federalists, led to the downfall of the party, and the name of the assembly was for half a century used as an opprobrious term. It is now generally conceded that this opprobrium was without just cause. In the rebellion, Connecticut did her full share for the support of the government, furnishing 50,000 men, and contributing money freely.

Connecticut is one of the smallest of the states, its area being only 4,674 sq.m., lying between 41° and 42° n., and about 71° 50′ to near 73° w.; with Massachusetts on the n., Rhode Island on the e., New York on the w., and Long Island sound on the south. In shape it is nearly a parallelogram of about 90 by 50 miles. The whole state lies on the s. slope of the New England hill region, and is hilly, though with no very high summits. The highest elevations are in the n.w. portion of the state. The largest river is the Connecticut, with a varying width, but usually not far from a quarter of a mile, and navigable to Hartford, 50 m. from the sound, into which it empties. Its course presents a series of beautiful views. The chief affluent of the Connecticut in the state is the Tunxis. In the e. part of the state is the Thames, formed by the Shetucket, the Yantic, and the Quinnebaug; it is navigable to Norwich. In the w. are the Housatonic and the Naugatuck, its affluent: the Housatonic being navigable to Derby, where the Naugatuck comes in. Smaller streams furnish abundant water-power. There are no large lakes. The Blue Hills of Southington, a part of the Holyoke range from Massachusetts, and the Housatonic Hills, are the prominent elevations.

Connecticut is not conspicuous for mineral wealth. Gold is unknown, and silver is found only in minute quantities in other ores. Copper mines were once of some consequence, but are unimportant since the working of the rich deposits at lake Superior. Iron is abundant, and has been worked for more than a century. Lead with slight traces of silver has been tried, but its working is not profitable. Marble and limestone are abundant and of excellent quality, and there are vast deposits of freestone, which is sent in immense quantities for building to New York and other cities. There are also flagging and tiling slates, clay of all kinds, granite, gneiss, and sulphate of barytes in great abundance. Some mineral springs are known, but none have become especially famous. Timber was formerly plentiful in Connecticut, and there are yet left oak, hickory, tulip, chestnut, ash, maple, birch, beech, and some other useful trees. Pine and hemlock are nearly gone. Wild grapes and berries are plentiful. The wild denizens of the forest, such as bears, panthers, and wolves, long ago disappeared. A few foxes remain; rabbits are in abundance, also squirrels, woodchucks, muskrats, moles, and the Norway and water rats. Now and then an eagle is seen; hawks, crows, ravens,

and owls are found, with gulls along the shore; song birds are numerous; game birds, grouse and woodcock are increasing under the protection of law; snipe and wild ducks and geese are abundant. Of fish, Connecticut has immense quantities, among the most valuable being shad, black, blue, rock, bass, pickerel, perch, sheepshead, weakfish, and catfish. Attention has been given recently to the cultivation of salmon. Mollusks and shellfish are very abundant, and great quantities are sent to the markets of large cities. Venomous snakes are scarce. The climate of Connecticut is severe, like that of all New England. Spring opens rapidly in April, cold weather comes about mid-November, and the winters are usually severe, snow being generally several inches deep, except near the coast, for many weeks at a time. The summers are correspondingly warm; the brief autumn is very pleasant, though often foggy. Swamps and marshes do not abound, and miasmatic diseases are almost unknown.

The state excels in variety and extent of manufactures. Agriculture is a large interest, however, and good crops are raised in the numerous valleys, while the uplands furnish excellent pasturage and cheap fuel. The principal fruits are apples, pears, grapes, and berries; and the chief crops are hay, oats, rye, corn, tobacco, and potatoes. The tobacco is of a superior kind, the leaves being excellent for "wrappers" of cigars. Dairy products are also among farming resources. The farms are usually small, averaging in 1870 about 60 acres of improved land each. For many years the sons of native farmers have sought homes in the west, and a considerable portion of the land in Connecticut is now in possession of emigrants from foreign countries. In point of value, woolens stand first among the manufactured goods; then cotton, hardware, iron-work, machinery, paper, india-rubber, wheeled vehicles, sewing-machines, hats, caps, silks, fire-arms, and cutlery. Though the smallest of the states except Delaware and Rhode Island, Connecticut stands eighth in the value of manufactured products. Clocks from Connecticut of all sizes and prices are scattered all over the world. In 1870, the value of clocks made in the United States was returned at $2,509,643, of which $2,245,043 was from this state.

Connecticut has four ports of entry on the sound—Stonington, New London, New Haven, and Fairfield; and on the river, Middletown. Foreign commerce is small, and these ports are not important.

There were issued in Connecticut Jan. 1, 1879, 116 newspapers and periodicals—14 daily, 4 semi-weekly, 86 weekly, 3 bi-weekly, 1 semi-monthly, 6 monthly, 1 bi-monthly, and 1 quarterly. The school age is 4 to 16 years, and the number between these ages in 1878 was 138,407, of whom 119,828 were enrolled in schools; average attendance, 77,218; school days, 178; teachers, 2,711; fund, $2,791,993; income from all sources, $1,509,159; expenses, $1,506,177. There is a normal school at New Britain with 18 male and 122 female students, and two training schools in New Haven with 1000 pupils. Yale college, non-sectarian, though historically affiliated with the Congregationalists, stands at the head of the higher institutions, with 97 professors and 1026 students. Trinity college at Hartford (Prot. Ep.) had at last report 15 instructors and 110 students; and Wesleyan university (Meth. Ep.) at Middletown had 17 professors and 163 pupils. The Yale divinity school (Cong.) had 11 professors and 107 students; the Berkeley divinity school at Middletown (Prot. Ep.), 7 teachers and 27 students; and the theological institute of Connecticut at Hartford (Cong.), 9 instructors and 38 students. The Sheffield scientific school (Yale college) had 26 instructors and 196 pupils; the medical department of Yale, 11 teachers and 60 students; and the Yale law school, 10 teachers and 59 pupils. The latest addition to Yale is the professorship of Chinese language and literature. Both sexes are admitted to the Wesleyan university.

Besides abundant steam navigation on the rivers and the sound, Connecticut has 21 railroads within or passing through her territory. The principal are the Hartford, Providence, and Fishkill, from Waterbury to Providence, R. I., 122¼ m.; New York, New Haven, and Hartford, Springfield, Mass. to New York, 123 m., with branches: New London Northern, from New London to Miller's Falls, Mass., 100 m.; New Haven and Northampton, from New Haven to Williamsburg, Mass., 84 m.; Housatonic, from Bridgeport to Mass. state line, 74 m.; Norwich and Worcester, from Norwich to Worcester, 59½ m.; Naugatuck, from Naugatuck to Winsted, 56½ m.; Boston and New York air line, from New Haven to Willimantic, 50 m.; Shore line, from New Haven to New London, 50 m.; Connecticut Western, from Hartford to New York state line, 66¾ m.; Connecticut Valley, from Hartford to Fenwick and Saybrook, 46½ m.; Shepaug, from Litchfield to Hawleyville, 32½ m.; Danbury and Norwalk, from Danbury to South Norwalk, 24 m.; Connecticut Central, from East Hartford to Mass. state line, 20½ m.; and seven roads from 13 m. to 2½ m. long.

The rights of women in Connecticut are well guarded. Real estate acquired by a married woman's services, or conveyed to her for a consideration, may be held for her own use. The husband is trustee of a wife's personal estate, which upon his death falls to her or her devisees, legatees, or heirs, as though she had never been married; and married women may convey by devise the same as single persons, except that a husband (if he have not abandoned her) must unite in conveying by deed. Divorce may be had for fraudulent contract, adultery, desertion, and neglect of duty for three years (the person not heard of), for seven years' habitual intemperance, cruelty, for imprisonment for life, and for certain crimes. The constitution of Connecticut is almost the same as in

other northern states, providing for distinct legislative, executive, and judicial officers. The governor must be 30 years of age, or over; is chosen annually, and is paid a salary of $2,000. His veto may be overcome by a majority in each house. The general assembly consists of a senate of 21 members, and a house of representatives according to population, districts being changed by the legislature after every federal census. Every town incorporated before 1785 has two members, and every later town one member. Each member is paid $300 per year. All elections are by ballot, and voters must be citizens 21 years old or over, and able to read any article in the United States constitution. The pardoning power is in the general assembly. The judiciary is a supreme court of errors, consisting of a chief and four judges; a superior court of six judges, together with the five of the court of errors; five courts of common pleas, each with one judge; special courts for certain cities; and justices of the peace. The higher judges are chosen by the assembly for eight years, and are disqualified on reaching 70 years of age; salary $4,000. Provision is made in the constitution for free schools, to support which there is an ample fund which was set apart when the state sold her claim to the western reserve in Ohio. Connecticut has four members of congress and six electoral votes. For president, her votes have been: 1789 (7 votes), Washington 7, Adams 5, Samuel Huntington of Conn. 2; in 1792 (9 votes), all for Washington and Adams; in 1796, Adams 9, Thomas Pinckney 4, John Jay 5; in 1800, all for Adams and Pinckney; in 1804 (when president and vice-president were first separately voted for), Charles C. Pinckney and Rufus King; in 1808, Pinckney and King; in 1812, George Clinton and Jared Ingersoll; in 1816, Rufus King, and for vice-president, James Ross of Pa. 5, and John Marshall of Va. 4; in 1820, Monroe and Tompkins; in 1824 (only 8 votes), J. Q. Adams and Andrew Jackson; in 1828, Adams and Richard Rush; in 1832, Henry Clay and John Sergeant; in 1836, Van Buren and R. M. Johnson; in 1840 (only 6 votes), Harrison and Tyler; in 1844, Clay and Frelinghuysen; in 1848, Taylor and Fillmore; in 1852, Pierce and William R. King; in 1856, Fremont and Dayton; in 1860, Lincoln and Hamlin; in 1864, Lincoln and Johnson; in 1868, Grant and Colfax; in 1872, Grant and Wilson; in 1876, Hayes and Wheeler. The chief officers of the general government from Connecticut have been a secretary of the treasury, two secretaries of war, four postmaster-generals, one attorney-general, one supreme court justice, three presidents *pro tem.* of the senate, and one speaker of the house. (For latest statistics, see APPENDIX.)

CONNER, DAVID, 1792–1856: b. Penn. He entered the United States navy in 1809 as midshipman, and was in the action (Feb. 24, 1813) when the American *Hornet* captured and sunk the British *Peacock*. In 1815, in the action between the *Hornet* and the *Penguin*, he was dangerously wounded. He became commander in 1825, and capt. in 1835. During the war with Mexico, he was on blockade duty in the gulf. After the war he was in command of the Philadelphia navy-yard.

CONNOISSEUR (Fr.), the French term by which we commonly designate persons who, without being themselves artists, are supposed to possess a discriminating knowledge of the merits of works of art. They are called by the Italians cognoscenti. See DILETTANTI.

CO'NOID, a solid formed by the revolution of a conic section round its axis; such are the sphere, paraboloid, ellipsoid, and hyperboloid.

CON'OLLY, JOHN, 1794–1867; a native of Lincolnshire, England. He studied medicine at Edinburgh, and practiced at Chichester and Stratford-on-Avon. In 1827, he was appointed professor of the practice of physics in University college, London. His most noteworthy work was done some years afterwards, by carrying out on a large scale the principle of non-restraint in the treatment of the insane. He also wrote much upon insanity and its treatment.

CONON, an Athenian gen., and one of the ten general officers who superseded Alcibiades, 406 B.C. In 405, the Athenian fleet was surprised by Lysander at Ægospotami, and Conon fled to his friend Evagoras, king of Cyprus. On the outbreak of the war between Sparta and the Persians, he obtained with Pharnabazus joint command of a Persian fleet. With this fleet, in 394, he defeated the Lacedæmonians near Cnidus, and thus deprived them of the empire of the sea, and finally completed his services to his country by restoring the long walls and fortications of the Piræus.

CONQUEST. In the law of succession in Scotland, heritable property acquired during the life-time of the deceased, by purchase, donation, or excambion, is called C., in opposition to that to which he has succeeded, which is called heritage. In the event of one dying intestate leaving only brothers, but brothers both older and younger than himself, or of his leaving uncles both older and younger than his father, or the issue of such brothers or uncles, these two kinds of property took different lines of succession, the heritage descending to the younger brothers or uncles, the C. ascending to the elder brothers or uncles. This was abolished in 1874. C., in a marriage-contract, merely means the difference between the possessions of the husband before and after marriage, allowance being made for the increased expenditure; or that by which he has been made richer (locupletior). Such property is frequently settled either on the heir or on the issue of the marriage.

CONRAD. See KONRAD.

CONRAD, ROBERT T., 1810–58; b. Philadelphia; a lawyer and author. While a student he wrote *Conrad of Naples*, a tragedy successfully represented in many cities. He wrote also for the press, and in 1822, began the *Daily Intelligencer*, which was soon merged in the *Philadelphia Gazette*. He edited *Graham's Magazine*, and was judge of the court of sessions. His best known drama is *Aylmere* (or *Jack Cade*), in which Edwin Forrest represented the hero. He also published a volume of poems.

CONRING, HERMANN, 1606–81; a native of Friesland, studied at Leyden, and was professor of medical science, philosophy, political science, and jurisprudence at Helmstedt. He was also privy councilor to the duke of Brunswick, and confidant of the German emperor. He was a voluminous writer on history, law, science, and theology. Elsie Sophie, his daughter, became distinguished as a poet.

CONSAL'VI, ERCOLE, Cardinal, a distinguished reformer of abuses in the papal states, was b. at Rome, June 8, 1757. He was made cardinal and secretary of state by pope Pius VII., and in this capacity concluded the concordat with Napoleon in 1801. His stanch maintenance of the rights of his own sovereign against the insidious encroachments of France offended Napoleon, who in 1806 demanded his removal from office; and the pope at last unwillingly consented, on the desire of C. himself, who was anxious that peace should continue. He was, however, again employed in 1815 in all the transactions between Rome and Paris, and also in settling the internal affairs of the papal states. In the latter capacity, he reformed numerous abuses; and the measure known as the *motu proprio*, introduced by him in 1816, suppressed all monopolies, feudal taxes, and exclusive rights. He was a liberal patron of science, but especially of the fine arts, and employed his leisure in the study of literature and music. In diplomacy, he displayed great address, and was generally successful. He died in Rome, January 24, 1824.

CONSANGUIN'ITY is relationship by blood, as distinguished from affinity (q.v.), or connection by marriage. C. is either *direct* or *lineal*—that is to say, in a line constituted by persons generating and generated, whether it be regarded in an ascending or descending point of view; or it is *collateral*, *oblique*, or *transverse*—that is, where the persons related are not descended the one from the other, but are all descended from a common parent. To persons related in the direct line belong parents and children, grandchildren, etc., to the remotest degree; to those related in the collateral line belong brothers and sisters, uncles and nephews, aunts, nieces, cousins, and the like. In computing the degrees of collateral C., a different system was adopted by the Roman and the canon law. According to the first, each person was counted as forming a degree, so that brothers, being each removed one degree from the father, were in the second degree to each other; according to the second, the number of generations on one side only was reckoned, so that brothers were in the first, and cousins-german in the second degree, instead of the fourth, as by the Roman computation. In the unequal collateral line, again, i.e., where one of the two persons is further removed than the other from the common stock, the canon law reckoned the distance by the number of generations of the person furthest removed. "Thus, a niece is related in the second degree to her uncle, because she is related in the second degree to her grandfather, the common stock; and by the same rule, she is no further removed from her uncle's son; which abundantly discovers the absurdity of that method of reckoning."—Erskine's *Institute*, b. i. tit. vi. s. 8.

The different methods in which the degrees of C. and affinity are computed in England and Scotland are explained under MARRIAGE, SUCCESSION, HEIR, etc.

CONSANGUINITY (Lat. *con*, together, and *sanguis*, blood), the relationship which subsists between persons who are of the same blood. It is either *direct*—which is the relationship between ascendants and descendants—or *collateral*, between persons sprung from a common ancestor. In the direct line, a son is said to stand in the first degree to his father; a grandson, in the second degree to his grandfather; and so on. In the collateral or oblique line, two different modes of numbering the degrees of consanguinity have been in use, the one that of the civil, the other of the canon law. By the civil law, the degrees are separately numbered downwards to each party from the common ancestor, the common ancestor not being counted. Thus, brothers are in the second degree of consanguinity; uncle and nephew in the third; cousins-german in the fourth; and second cousins, or the children of cousins-german, in the sixth degree. By the canon law, consanguinity in the equal oblique line, i.e., where the parties are equally removed from the common ancestor, is computed by the number of degrees between one of them only and the common ancestor; brothers being said to stand in the first, and cousins-german in the second, degree to each other. In the unequal oblique line, i.e., which the parties stand in different degrees of relationship to the common ancestor, the degree is determined by the number of steps between the common ancestor and the party further removed from him: thus, uncle and nephew are computed as in the second degree to each other, because the nephew, the further removed of the two, stands in the second degree to the common ancestor, his grandfather. The canon-law computation is more generally used by English lawyers, though statute 22 and 23 Car. I. c. 10 adopts that of the civil law. Scotch lawyers, since the reformation, have generally used the civil law mode of computation.

Affinity is the relationship brought about by marriage between a husband and the blood-relations of his wife, or between a wife and the blood-relations of her husband. The relations of one spouse in any particular degree of consanguinity stand in the same degree of affinity to the other spouse. There is no relationship by affinity between the blood-relations of the husband and those of the wife.

Consanguinity and affinity have been at different times and in different parts of the world more or less looked on as impediments to marriage between the parties related. Among the ancient Persians and Egyptians, marriages are said to have been sometimes sanctioned between brother and sister, and even father and daughter. The Athenians, while permitting marriages between brothers and sisters uterine, prohibited them between the same relations by the father's side or the full blood. In the book of Genesis, we read of Abraham marrying his half-sister. The Levitical law prohibited marriage between relations in the direct line, between brother and sister, nephew and aunt, and apparently by implication, uncle and niece. A son was prohibited from marrying his father's wife.

The Roman law prohibited marriage between ascendants and descendants, a prohibition extended to relations by adoption, and even after the dissolution of that tie. In the collateral line, the prohibited degrees included brother and sister (extending to persons so related by adoption where the tie continued to exist), and all cases where one party stood *in loco parentis* to the other, as uncle and niece. Marriage between cousins-german, at one time prohibited, was declared lawful by Arcadius and Honorius. The degrees prohibited in consanguinity were by Constantine also prohibited in affinity.

By the old canon law and early decretals, marriages were prohibited between persons as far removed as the seventh degree of consanguinity or affinity—i.e., between persons who might, by the civil law computation, be within the twelfth degree to one another. The fourth council of Lateran, 1215 A.D., narrowed the prohibition from the seventh to the fourth degree; i.e., the grandchildren of cousins-german. Affinity was held to be constituted not merely by marriage, but by the spiritual relationship of standing sponsor at baptism, and by illicit intercourse; marriage being prohibited between persons one of whom had had carnal connection with a relation in the fourth degree of the other. A marriage between persons related in any of these ways was accounted incestuous, and the children bastards. The pope assumed the right of granting dispensations from impediments to marriage arising from consanguinity and affinity, a power which seems to have been first exercised in the 12th century. In no instances have dispensations been granted to relations in the direct line, but one or two dispensations are said to have been granted between brother and sister; and between uncle and niece, they are still occasionally granted in countries where the canon law continues to be binding. Between remoter relations, they have been common. The extent to which these prohibitions were carried, and the possibility of their being dispensed with, naturally tended to encourage profligacy and lax ideas of the marriage tie, it being hardly possible to say of any marriage that it might not one day be proved invalid. The council of Trent restricted the impediment of affinity from illicit intercourse to the second degree.

In the countries which embraced the reformation, a general relaxation took place in the prohibitions to marriage from consanguinity and affinity. In England, 32 Hen. VIII. c. 38 allowed all persons to marry who were not prohibited by the Levitical law; and according to the interpretation put on this statute, the prohibitions included all relations in the direct line, brother and sister, and collaterals, when one party is brother or sister to the direct ascendant or descendant of the other; the degrees prohibited in consanguinity being equally prohibited in affinity. The prohibitions from consanguinity have been held to extend to bastard relations. But down to 1835, marriages within the prohibited degrees were valid and the issue legitimate, unless the marriage had been annulled by a declaratory sentence of the ecclesiastical court, which could only be obtained while both spouses were alive. By act 5 and 6 Will. IV. c. 54, all marriages within the prohibited degrees of consanguinity and affinity were made absolutely void.

In Scotland, for a very short time after the reformation, the papal power of dispensation was exercised by the crown. Acts 1567, c. 14, and 1567, c. 15, professing to take the Levitical law as the standard, assimilated the prohibitions from consanguinity and affinity to those of England. Incest, or sexual intercourse with persons within the prohibited degrees, was, by the former statute, made a capital crime. As to marriages between bastard relations, the law of Scotland is in a doubtful state; but there is no prohibition against marriage with a relation however near of a person with whom one has had sexual intercourse.

In France, the code Napoléon prohibits marriage between ascendants and descendants lawful or natural, and persons similarly connected by affinity; and in the collateral line between brothers and sisters lawful or natural, and persons similarly connected by affinity. Marriage between uncle and niece, and aunt and nephew, is also prohibited. In Spain and Portugal, the canon-law restrictions are in full force, with the corresponding system of permissive dispensations. In various countries of Europe, as Denmark, no prohibitions from affinity, except in the direct line, are recognized. In most of the United States of America, marriage is allowed between uncle and niece.

CONSCIENCE. See ETHICS.

CONSCIENCE, COURTS OF, IN ENGLAND. These were courts for the recovery of small debts, constituted by special local acts of parliament in London, Westminster, and other trading districts. These courts were also called *courts of requests.* On the establishment of county courts, the courts of C., with a few exceptions, were abolished. See COUNTY COURTS.

CONSCIENCE, HENDRICK, the most fertile and original writer of fiction in Belgium, was born Dec. 3, 1812, at Antwerp, where his father was inspector of the dock-yards, until he became a dealer in waste-paper, old books, etc. C. educated himself by the aid of his father's miscellaneous store of books until his 15th year, when he entered a school, where he was engaged to assist the master in teaching. On the breaking out of the revolution in 1830, C. joined the ranks under gen. Niellon, and served till 1834, when he left the service, being disgusted with the stricter discipline that was being introduced. Having failed in all his attempts to obtain employment, he tried his hand at writing, and composed in Flemish the novel, *In het Wonderjaer* 1566 (Ghent, 1837), which, notwithstanding its unprecedented success, left him in debt with his printer. His father refused to do anything for him until he took up some regular employment; and he was thus driven from home in an almost penniless state. At this time, the painter Wappers interested himself for him, and procured him some slight assistance from the king. C. now wrote his *Phantasia,* a collection of fantastic tales, and his celebrated historical novel, *De Leeuw van Vlanderen* (Antw. 1838); but being soon dissatisfied with the small pay and irksome work of the post he had obtained in a government office, he threw up all his avocations, and for a year worked as a gardener. Wappers again befriended him, by inducing the king to give him the place of registrar at the royal academy of painting at Antwerp. In 1845, he obtained the honorary title of agrégé of the university of Ghent, and was appointed to instruct the royal children in Flemish. C. has written numerous tales and novels, most of which have been translated into French and German, and some into English—as, for instance, his *Sketches of Flemish Life,* of which several English translations have been made; *Demon of Gold; Lion of Flanders,* etc. C. has written two historical novels, *Geschiedenis van Graf Hugo van Cruenhove* (1845), and *Jakob van Artevelde* (1849), which are esteemed among his best; but his *forte* lies rather in the delineation of simple village life. His *Illustrated History of Belgium* (1845) is interesting as a national work, but of little value as an authority. In 1870, he published *Eene en Lieveken;* in 1871, *De Kerels van Vlanderen* (1871); in 1874, *De Keuvdes Harten* and *Eene Verwarde Zaak;* in 1875, *Schandevrees;* in 1876, *Gerechtigheid van Hertog Karel.* C. has contributed largely to the revival of Flemish literature.

CONSCIOUSNESS. This is perhaps the most comprehensive term employed in designating the mind. If it had been used only in its widest signification, there would have been little difficulty in defining it; but unfortunately there are some exceedingly important meanings of a narrower range that are commonly expressed by it, rendering it an ambiguous or equivocal term, and, like all such terms, a source of fallacy and misapprehension.

In the widest meaning, C. is almost identical with mind in action. When we are mentally alive, or performing any of the recognized functions of the mind, we are said to be conscious; while the total cessation of every mental energy is described by the term "unconsciousness," among other phrases. In dreamless sleep, in stupor, fainting, and under the influence of the anæsthetic drugs, we are unconscious; in waking, or rallying into renewed mental activity, we are said to become conscious.

As the mind in its waking or active condition may be more or less excited, or vary in the intensity of its manifestations, there are degrees of C.; and, in accordance with a very common usage, the name is apt to be applied to denote the higher degrees in opposition to the lower.

In first learning to write, to cast up sums, or to play on an instrument, our mind is put very much on the stretch; in other words, we are very much excited or highly conscious. When years of incessant practice have consummated the process into a full-formed habit, a very small amount of mental attention is involved; and we may then be said to perform the work all but unconsciously.

We must next advert to the special or restricted meanings of the term, which are those that play the most important part in philosophical discussion. In the first place, we find it applied to denote the mind's cognizance of itself, as opposed to the cognizance or examination of the outer world. Hence, in studying our own minds, we are said to be using C. as the instrument; but in studying minerals or plants, we resort to external observation by the senses. A contrast is thus instituted between C. and observation, which contrast gives to the former word a peculiarly contracted meaning; for, in the wide sense above described, observation is truly an act of consciousness.

In the next place, C. is sometimes identified with belief. We often express a strong affirmation by saying, that we are quite conscious that such a thing is so. It is the strong instinctive tendency of our nature to believe a number of things before we have gone through any large experience of matter of fact. The believing function is a prominent attribute of mental activity. We are scarcely able to feel or act without the operation of belief, or without making assumptions in anticipation of the reality. We believe first, and prove and disprove afterwards. The more intensely we are made con-

scious, the more strongly we pass into these intuitive convictions. We unhesitatingly believe in the future persistence and universal prevalence of the order of things that we are born into, until such time as our experience gives us a check. Our emotions all produce beliefs in proportion to their strength. Fear makes us believe in coming evil; joy and elation give confidence in coming good. So that it is true, to a certain extent, that the state of belief is engendered along with C., and is stronger as that is stronger, but it does not follow, as is frequently maintained, that to be conscious of every affirmation is to verify it, because our C. cannot be presumed to lie. See COMMON SENSE.

Correct usage, therefore, would dictate the employment of the term in question only in the one sense, in which it is co-extensive with being mentally alive, as opposed to sleep, torpor, insensibility, etc. Anything that renders the mental activity more intense, that increases the whirl of the brain (such as strong pleasures and pains, great interest in anything that is going on, etc.) is designated by the positive term C.; the opposite condition, and also the feebler modes of excitement, are expressed by the negative—unconsciousness. All mere special and restricted applications should be forborne, as introducing confusion into thought, and error into philosophy. The study of our own mind may be expressed by such phrases as "self-consciousness," "introspective attention," and the like. As it is an entire fallacy to talk of C. in general as accrediting doctrines or matters of belief, any acceptation of the word implying this should be avoided.

Points of great importance are involved in the determination of the *conditions* of C., or the circumstances attendant on the manifestation of mental excitement; in other words, the stimulants of our emotional and intellectual wakefulness. The most general and fundamental condition of our becoming conscious, as regards influences external to the mind, is *change*. The even continuance of one impression tends to unconsciousness; and there are a number of facts that show that if an influence were present in one unvarying degree from the first moment of life to the last, that influence would be to our feeling and knowledge as if it did not exist at all. This important point is more fully illustrated under CONDITIONED.

In a work entitled *Contributions to Mental Philosophy*, by Immanuel Hermann Fichte—the son of the renowned Johann Gottlieb Fichte—translated by Mr. Morell (Longmans, 1859), the attempt is made to establish the existence of a preconscious mind, distinct from our conscious life, and not dependent like that upon the bodily organization.

It appears that Fichte considers the power of germination and growth—or that energy, whatever it is, that unfolds the germ and conducts it to a completely formed organization—as a function of the mind or soul; which is almost to revert to the views of the ancient philosophers, with whom the soul was the "vital principle," or the peculiarity that distinguished organized beings from minerals. Aristotle spoke of the soul of plants as well as of animals, or of man. Fichte couples this power of germination with the following things—namely, the instincts; the processes of intelligence that we seem to go through without being aware of the steps, as in the sudden inspirations of men of genius; with all the mysterious phenomena of second-sight, clairvoyance, etc.; and the aggregate of this he erects into a preconscious mind or soul, the contrast of C. as above defined. For the varieties or divisions of our conscious states, see MIND.

CONSCIOUSNESS, DOUBLE. See DOUBLE CONSCIOUSNESS.

CON'SCRIPT FATHERS, a name given to the Roman senators after the expulsion of the Tarquins, when Brutus added 100 to the number of senators, writing the old and new names together—*con-scripti*.

CONSCRIPTION is the system whereby the French—since the year 1795—and some other foreign armies are recruited. It differs essentially from the English system in being compulsory, and, taken for all in all, as a disturbance of the system of employment in all grades of society, is probably the most expensive means of recruitment yet devised (see BRITISH ARMY). Every Frenchman may be called to enter the army at the age of 20; but those who choose to enlist, as early as 18. He cannot again be called upon to serve. The term is for 5 years in the regular army, 4 in the army reserve, 5 years in the territorial army (militia), and 6 in the territorial reserve. This brings the conscript to 40 years of age, when his liability to service ceases. The law of 1872, reorganizing the French army, forbids the providing of substitutes by conscripts. An account is kept of the number of youths in France who reach the age of 20 in each year (about 280,000). All those are exempt from conscription who are under 5 ft. 2 in. in height; or have any natural infirmities unfitting them for active service; or are the eldest of a family of orphans; or are the only sons of widows, or of disabled fathers, or of fathers above 70 years of age; or are intended for the church; or are pupils at certain colleges. Moreover, if two brothers be drawn as conscripts, and the younger is efficient, the elder is declared exempt; and if of two only brothers one is already in the army, or has retired through wounds or infirmity, the other is exempt. Culprits and felons are not allowed to enlist. The law of 1872 making military service obligatory on all Frenchmen (save in the above cases) has assimilated the French army system to that enforced in Prussia since 1813.

CONSECRATION is the act of solemnly dedicating a person or thing to the service of God. It is one of the most widely spread religious ceremonies of the ancient world, being practiced in India, Egypt, Chaldea, Judea, Greece, Rome, Britain, and other countries. In the Old Testament we read of the C. or dedication of the first-born, both man and beast, to the Lord; also the dedication of the Levites, of the tabernacle and altar, of fields, houses, walls, etc. This custom, at least so far as regarded places and things, did not pass immediately from Judaism to Christianity, for the latter being more or less a persecuted religion until the time of Constantine, could not venture to indulge with safety in any public ceremonialism; but no sooner was the sword of persecution sheathed than, according to Eusebius, "the sight was afforded us, so eagerly desired and prayed for by all—the festivals of dedications and consecrations of the newly-erected houses of prayer throughout the cities." Eusebius himself describes the C. of the church built at Jerusalem by Constantine, 335 A.D. The practice of consecrating religious edifices has continued to the present day in the Roman and Anglican churches. The forms were at first very simple, consisting chiefly of prayer, the celebration of the Lord's supper, thanksgiving, and benediction; but they afterwards became more numerous and imposing, whilst, also, the bishops and higher dignitaries assumed the power of consecrating entirely to themselves. An important part of the C. of Roman Catholic churches consists in the deposition of relics for a time upon the altar. In the English church, each bishop is left to his own discretion as to the form of C. to be adopted, but that most generally used is the form sent down by the bishops to the lower houses of convocation in 1712. The English church also retains the C. of burying-grounds.

C. OF ARCHBISHOPS AND BISHOPS.—According to a canon of the first Nicene council, there must be four, or at least three bishops present at the C. of an archbishop or bishop. The form used in the church of England is that prepared in the reign of Edward VI. The Romanists deny the validity of English orders generally, as derived from heretical and improperly consecrated bishops. They had an old story, refuted by their own historian Lingard, which is known as that of the "Nag's Head consecration." According to this story, archbishop Parker was consecrated at the Nag's Head tavern, Cheapside, by one of the Protestant bishops present laying a Bible on his head, and saying: "Take thou authority," etc. Lingard thus relates the facts: "Barlow, the deprived bishop of Bath, and Hodgkins, once suffragan of Bedford, who had both been consecrated according to the Roman Catholic pontifical, in the reign of Henry VIII., and Scorey, the deprived bishop of Chichester, and Coverdale, the deprived bishop of Exeter, who had been both consecrated according to the reformed ordinal, proceeded to confirm the election of Parker, and then to consecrate him after the form adopted in the reign of Edward VI. A few days later, Parker, as archbishop, confirmed the election of Barlow to the see of Chichester, and of Scorey to that of Hereford, and with these for his assistants, consecrated all the other prelates elect." The C. took place in the chapel at Lambeth, as appears by the archbishop's register, and Lingard says that there is nothing to countenance the supposition of the entry being other than authentic. The story probably arose from a fact, mentioned by Fuller, that the commissioners who confirmed Parker's election dined at the Nag's Head, a tavern much frequented by the country clergy.

CONSECRATION OF THE ELEMENTS. See LORD'S SUPPER.

CONSECUTIVE, a term in music, applied to octaves and fifths, which, according to the rules of harmony, are strictly forbidden.

CONSEGUIANA, a volcano of Nicaragua, occupies a promontory on the s. side of Fonseca gulf, about 10 m. distant from the Pacific ocean. The crater, at an elevation of about 4,000 ft. above the mean level of the surrounding country, is about half a mile across, while its interior descends perpendicularly to a depth of 200 feet. In 1835, a fearful eruption, the last on record, converted into a waste a large tract of grazing land.

CONSENT. When we state that C. is the foundation of all contracts and legal obligations of every kind, we state a proposition often in the mouths of lawyers, but the vast magnitude and importance of which is by no means always apparent even to them. The doctrine that the free C. of the parties bound, and not the will of any earthly legislator, or the form in which that will is expressed, constitutes the binding element in contracts, flows as an inevitable logical consequence from the doctrines of personal and political freedom. And yet we continually forget it, and not only speak but act at variance with it. We talk of persons being married by the priest, and divorced by the proctor, whereas it is obvious that a valid marriage, like every other contract, can be made and unmade only by the contracting parties; and that all that either civil or ecclesiastical authority can do, is to ascertain, at the instance of one or other of them, whether it *has* been made or unmade. From overlooking this point of view, differences between legal systems, which are merely external, are often supposed to be fundamental. The law of Scotland, which admits several ways of proving matrimonial C. which the law of England rejects, is on this account supposed to differ from it *in principle*. The only question between them, in reality, is, as to whether the circumstances which the law of Scotland admits in proof of the existence of C. do or do not prove it in point

of fact. If it be true that the only means by which it can be ascertained that two persons do agree to be man and wife, is by their declaring their agreement either before a clergyman or before a parliamentary registrar, then the law of England does right in rejecting all other evidence. If, on the contrary, the fact can be established, as is believed in Scotland, by other means, such as a declaration before witnesses, or an exchange of writings, then the law of Scotland is right in admitting these means of proving it, and making the question of marriage or no-marriage, as it does, one of simple proof. The difference between the two systems is thus seen to be not one of principle, but one of expediency—a question, not in the law of marriage, or of contracts, which is the same in both countries, and in every country, but in the law of evidence.

Yet so strangely illogical are mankind, that in Scotland it is still asked whether or not a marriage can be constituted, in certain circumstances, without a declarator of the court of session; and in England, until very recently, no marriage could be dissolved without an act of parliament. The practical question as to how C. shall be proved, is one surrounded at all times with the greatest difficulty. That its absence may be assumed in the case of all persons of imperfect understanding, and, consequently, that the power of contracting should be denied to idiots, madmen, and pupils, helps us but a very small way. The real difficulty consists in distinguishing, in the case of grown and sane men, between such *real* C. as may be safely assumed to be a deliberate act of the reason, taking that word in its widest sense, and such *apparent* C. as may have had its motive in caprice, passion, ignorance, or any temporary and accidental aberration of mind.

CONSEN'TES DII, the twelve chief roman deities: Jupiter, Apollo, Mars, Neptune, Mercury, Vulcan, Juno, Vesta, Minerva, Ceres, Diana, and Venus.

CONSERVA'TION OF FORCE. See FORCE.

CONSERVATIVE. See WHIG AND TORY.

CONSERVATOIRE, or CONSERVATO'RIUM (Ital. *conservatorio*), a name given by the Italians to schools instituted for the purpose of advancing the study of music and maintaining its purity. In the earliest times, these schools were partly attached to benevolent institutions and hospitals; others, again, were supported by opulent private individuals. They were originally intended for foundlings, orphans, and the children of poor parents. Some trace their origin to St. Ambrose, bishop of Milan, in the 4th c., or St. Leo, who flourished in the 5th. The scholars, male and female, all received free board, lodging, clothing, and were taught to sing and play. Extra boarders were also admitted on paying a fee. In Naples, there were at one time three such schools, while in Venice there were four, expressly for females. In 1818, the Neapolitan conservatoires were reduced to one, under the name of Real Collegio di Musica. The Venetian conservatoires shared in the downfall of the Venetian republic. A new grand C. was founded at Milan in 1808, which still exists. In France, the necessity of a school for educating singers gave rise to the *Ecole Royale de Chant et de Déclamation*, in 1784. During the French revolution, in consequence of the scarcity of instrumental musicians for the army, the government decreed the erection of an institut national de musique, in 1793, which was changed into the present establishment in 1795 under the name of the C. de Musique. The yearly expenses of this C. were fixed at 240,000 francs, the number of masters was 115, and the pupils of both sexes amounted to 600. In 1802, the expense was reduced to 140,000 francs, with a corresponding reduction in the number of masters and pupils. The course of study is divided over 66 different classes, in which all appertaining to music and also declamation is taught by the best masters. The elementary works published by this C. for all instruments are known over the whole world. Next to the conservatoires of Italy and France come those of Warsaw, Prague, Brussels, and Vienna, which last was established in 1816. In 1842, a C. was established in Leipsic, under the auspices of Mendelssohn, which is reckoned the most important in Germany at the present day. There are also conservatoires in Cologne, Munich, Stuttgart, Berlin, etc.

CONSERVATORS OF THE PEACE. The sovereign, by virtue of his office, is the principal conservator of the peace within these realms. The function which he thus possesses he may delegate, thus constituting a subject a conservator of the peace. The office, however, must always be exercised in the sovereign's name, and it is for this reason that we always speak of the king's or of the queen's peace. Several high officers of the crown, the chancellor or keeper, the lord high steward, the lord marshal, and the lord high constable, when there are such officers, all the justices of the queen's bench, the master of the rolls, are C. of the P. throughout the whole kingdom, and may commit breakers of the peace or bind them in cognizances anywhere. Other judges possess this power only within the limits of their own jurisdiction. The sheriff and coroner are C. of the P. within their respective counties, and constables, tithing-men, etc., within their jurisdictions But in addition to these official conservators, others were appointed expressly for the purpose, previous to the appointment of justices of the peace, in the reign of Edward III. Their powers were far inferior to those of the justices, being confined exclusively to the function which the name indicates. The lords

of manors frequently possessed the powers of conservators within their manors by prescription, and it was not unusual for lands to be held on the tenure of discharging the duties of a conservator of the peace within the county. Lastly, conservators were appointed by letters-patent from the crown in cases of emergency for the preservation of the peace in particular districts. All these different kinds of conservators, with the exception of these judges and others who are conservators *ex officio* were superseded by the appointment of justices of the peace (q.v.).

CONSERVA'TOR OF THE STAPLE. See CAMPVERE.

CONSERVATORY, in horticulture, a house for the cultivation of tender exotic plants, which, although requiring protection from frosts, and a little assistance of artificial heat, do not need the heat of the hot-house or stove. The only distinction between a C. and a green-house is, that in the former the plants grow in borders of earth; in the latter, they are in pots; and these two characters are often combined. The structure, management, etc., are much the same for the C. as for the green-house; but in the warmer parts of the country, the roof and even the sides are with advantage made capable of being removed in summer. In all situations, the most free and frequent ventilation is requisite. A C. is often attached to a mansion, so as to communicate directly with one or more of the apartments, instead of being placed in the garden.

CON'SERVES are described by Cooley in his *Cyclopædia of Practical Receipts*, to be "recent vegetable matter, as flowers, herbs, roots, fruit, and seed, beaten with powdered sugar to the consistence of a stiff paste, so as to preserve them as nearly as possible in their natural freshness." C. are made by druggists as vehicles for more active medicines, and by confectioners as sweetmeats.

CONSHOHOCK'EN, a borough on the Schuykill river and the Reading railroad, 13 m. n.w. of Philadelphia; pop. 3,071. It is a manufacturing place, and has blast-furnaces, rolling-mills, machine-shops, etc.

CONSIDÉRANT, VICTOR-PROSPER, a French socialist, was b. in 1805 at Salins, in the department of Jura. After being educated at the polytechnic school at Paris, he entered the army, which, however, he soon left to promulgate the doctrines of Fourier (q.v.). After the death of his master, C. became the head of the societarians, and undertook the management of *The Phalanx*, a review devoted to the maintenance and spread of their opinions. Having gained the support of a young Englishman, Mr. Young, who advanced the required sum of money, C. established, 1832, on a large estate in the department Eure et Loire, a socialist colony or *Phalanstère;* but the experiment failed, and with it *The Phalanx* fell to the ground. However, a new organ of co-operative doctrine, the *Démocratie Pacifique*, was soon established, and was edited by C., who displayed great zeal, perseverance, and ability in his hopeless battle with the laws of society as now constituted. Among his numerous writings, the chief is the *Destinée Sociale*, dedicated to Louis Philippe. In 1849, C. was accused of high treason, and compelled to escape into Belgium, whence he emigrated to Texas, returned to Brussels, and again went to Texas, where he founded a societarian community, *La Réunion*, which flourished for a time, but has since come to nothing. C. returned to France in 1869. See COMMUNISM.

CONSIDERA'TION, in law, the thing given, or done, or the forbearing or suffering something as recompense to another, for doing, giving, forbearing, or suffering. An obligation incurred without C. is, in England, termed voluntary, in Scotland gratuitous; if for C., it is so styled in England, but in Scotland it is called onerous. Considerations are divided in England into good and valuable, the former being affection for a near relative, the latter a pecuniary or other tangible benefit, or marriage. There is no corresponding division in Scotland. But in Scotland, on the other hand, there is, as a general rule, no need for the intervention of a C. to make a contract valid, while in England a contract without C. is invalid, unless it be evidenced by formal deed (q.v.). In this respect, the law of England is founded upon the maxim of the civil law, *ex nudo pacto non oritur actio;* while the Scottish rule is founded on that of the canon law, *omne verbum de ore fideli cadit in debitum.* But the C. which in England is sufficient to support a contract, may be of the most illusory kind. Thus, an agreement to take less than the full sum in payment of a debt is without C. and invalid, even though the sum stipulated be paid, because there is no C. to support the agreement to give up the residue; but if the agreement was to take a stick of sealing-wax instead of the money, it is an agreement for valuable C. and binding, and the transfer of the wax extinguishes the debt.

There are some circumstances which, in both countries, warrant the setting aside of obligations without C., whether made by deed or not. In England, they are void as against *bona fide* purchasers, by 27 Eliz. c. 4; and void as against creditors where the grantor is indebted to such creditors at the time to the extent of insolvency, by 13 Eliz. c. 5. A similar rule to the latter is established in Scotland by the act 1696, c. 5., and without proof of insolvency when the deed is granted to a near relation, or a person in a confidential situation, by 1621, c. 18. And all obligations for which the C. is illegal or immoral, are in both countries void.

CONSIGNMENT, in mercantile law, is the term applied to goods which are placed in the hands of an agent or factor, for sale, or for some other specified purpose. Where either the consigner or consignee becomes bankrupt, questions of nicety often arise regarding ownership, and the consequent rights of the parties and their creditors.

CONSISTORY (Lat. *consistorium*), properly, a place of assembly, but in the later Latinity the word came to signify the particular place where the privy council or cabinet of the Roman emperor met, and after the time of Diocletian and Constantine, the council itself. The assessors of this council were partly the ordinary members (*comites consistoriani*), such as the imperial chancellor and seneschal, partly extraordinary; and their duty was to deliberate on all the important affairs of legislation, administration, and justice. The *form* of the imperial C. passed over into the early Christian church. The bishops established their consistories; and the highest ecclesiastical court, composed only of cardinals (the college of cardinals), which meets in the Vatican, under the presidency of the pope, to determine all such matters as the appointment of cardinals, archbishops, bishops, etc., still bears this name, as do also the private councils which the pope can call at his pleasure. The Protestant church of Germany was induced to perpetuate the consistorial courts principally because the episcopal authority passed into the hands of territorial princes (Ger. *Landesfürsten*) not familiar with ecclesiastical affairs. The first Lutheran C. was established at Wittenberg in 1542. After 1555, when the peace of Augsburg secured the recognition of the Protestant religion, similar consistories were gradually formed in other places. The Lutheran consistories exercise a supervision and discipline over religion and education, over the clergy and the schoolmasters, and examine the theological candidates on their trials for license and ordination. They have the regulation of divine worship, the administration of church property, and at an earlier period possessed a certain jurisdiction in regard to marriage.—In the French Protestant churches, the C. possesses a more restricted jurisdiction than in Germany. It exercises authority over a *circonscription*—i.e., a division of the church containing 6,000 souls—and is composed of all the pastors of the *circonscription*, together with from 6 to 12 lay-elders elected by a certain number of the people. In that portion of the French Protestant church which has adopted the Augsburg confession, the authority of the French monarch is more recognized than in the reformed church, for it has a *consistoire général*, composed of delegates, lay and clerical, of the various *circonscriptions*, the president of which is a layman nominated by the emperor.—In England, the word is used to denote the court Christian, or spiritual court. Every archbishop and bishop has a consistorial court, held either in his cathedral or other convenient place, before his chancellor or commissary for ecclesiastical causes. In Scotland, the consistorial courts have lapsed into the commissary courts. See COMMISSARY.

CONSIS'TORY (*ante*), the name of the body of officials in each local church of the "reformed" denominations (Dutch or German) in the United States.

CONSOLA'TO DEL MA'RÉ. See MERCANTILE LAW.

CON'SOLE (Fr.), in architecture, a projection resembling a bracket, frequently in the form of the letter S, used to support cornices, or for placing busts, vases, or figures on. Consoles were often richly ornamented in the under part. See BRACKET, CANTALEVER.

CONSOLIDA'TION ACTS. In order to secure uniformity in acts of parliament having reference to public undertakings, and to avoid the necessity of repeating, in each special act, the clauses usually introduced into such acts, the device has been adopted of consolidating or combining all these provisions in one act having reference to the particular kind of undertaking. Of general acts of this nature the most important are: The companies' clauses consolidation act, 1845 (8 and 9 Vict. c. 16); the lands' clauses consolidation act, 1845 (8 and 9 Vict. c. 18), amended as to Ireland (14 and 15 Vict. c. 70); and the railways' clauses consolidation act, 1845 (8 and 9 Vict. c. 20).

CON'SOLS, a contraction of consolidated annuities. In incurring the national debt, government borrowed money at different periods on special conditions, being generally the payment of an annuity of so much per cent on the sum borrowed. Great confusion arose from the variety of stocks thus created, and it was thought expedient to strike an average of their value, and consolidate them into one fund, kept in one account at the bank of England. The consolidated annuities' act was passed in 1757.

CON'SONANCE, in music, a term applied to combinations of sounds, whose vibrations when heard together so satisfy the ear that no other sound is wished for, or expected to follow. The more or less satisfying effect of C. depends on the greater or less simplicity of the interval formed by the combined sounds. Intervals whose relative vibrations can be expressed by numbers from 1 to 6, are considered consonant; while those which can only be expressed by the higher numbers, not a duplication of the lower, as 7, 9, 11, 13, etc., are called dissonant. Sounds vibrating as 1 : 1, are unison; as 1 : 2, produce the octave; as 2 : 3, the fifth, which inverted becomes 3 : 4, the fourth; as 4 : 5, the major third, which inverted becomes 5 : 8, the minor sixth; and 5 : 6, the minor third, which inverted becomes 6 : 10, or 3 : 5, the major sixth. Consonant intervals are therefore the third, fourth, fifth, sixth, and octave; from which it follows that there is only one consonant fundamental chord in music, viz., the common chord, or *trias harmonica perfecta*, being a bass note with its third, fifth, and octave, which inverted

produces the chords of the 6th and the $\frac{4}{4}$. See CHORD. The ancient Greeks admitted of still fewer consonances in their system of music, as they treated the third and sixth as dissonances; a proof that their system of harmony was not the same as ours. Their name for C. was symphony, and for dissonance, diaphony. Early in the middle ages, only the octave, fifth, and third were treated as consonances. Franco of Cologne was the first who divided C. into perfect, semi-perfect, and imperfect. In the writings of Marchettus, and of Joannes de Muris, in the first half of the 14th c., we find already the important rule, that two perfect consonances following in similar progression are not allowable. The study of the C. was carried still further in the 16th c. by Zerlino, who ascertained the true mathematical proportions of the major and minor thirds. Notwithstanding this, Palestrina, up to the end of the same century, and, long after him, all who wrote in the same style, carefully avoided the use of the third in the final chord, finishing always with the perfect consonances according to Franco. Of late years, the importance of the C. has attracted the attention of many eminent theorists in music, as well as philosophical writers of undoubted judgment, some of whom do not hesitate to consider the interval of the seventh a C., because it differs from other dissonances in not requiring preparation. There cannot be a doubt that the chord of the seventh, C, E, G, and B flat, considered individually, and not in connection with other chords, is as euphonious and satisfying as the common chord; and when these intervals are placed at the distance from the fundamental note they harmonically arise at, the consonant nature of the combination is still more obvious. A scientific organ-builder in Scotland has long been in the practice of introducing the seventh as an interval in his mixture stops, forming with the fundamental stops a union of sound decidedly consonant, and producing a remarkably brilliant effect. The exact limit of C., or the point where dissonance begins, seems not definitely fixed, if fixed it can be. To define C. to be agreeable sounds, and dissonance to be the reverse, as some do, is clearly absurd, because they both essentially belong to harmony or concord, or, as the Germans more properly call it, *Die Kunst des Wohlklangs*, in which there can be nothing absolutely discordant.

A perfect C. causes a musical effect known as Tartini's grave harmonic, it having been first observed by the eminent violinist of that name. Along with any two musical notes sounded continuously, there may be heard (if the notes are in accord) a third deeper tone, caused by that number of vibrations which is the greatest common measure of the numbers producing the primary notes, and upon this Tartini founded his theory of harmony (now obsolete), by assuming that the grave note is the natural base of the chord producing it. The note thus sounded may be too deep to be appreciated by the uneducated ear, although felt as a succession of beats, and these should not be confounded with the "beats" resulting from the sound of a discordant interval, a species of jar or flutter known to tuners as the consequence of the *imperfection* of a consonance. The subject is treated at length by prof. de Morgan in a paper published in the transactions of the Cambridge philosophical society, 1858.

CONSONANT. See LETTERS.

CONSORT, literally, one who throws in his lot with another. In English constitutional law, the term is applied to the husband or wife of the reigning sovereign, viewed not in a private but a public capacity, as participating to a certain limited extent in the prerogatives of sovereignty. The extent of these prerogatives in the case of a queen C. are stated by Blackstone. She is, he says, a public person, exempt and distinct from the king, and "not, like other married women, so closely connected, as to have lost all legal or separate existence so long as the marriage continues." For this, sir Edward Coke gives the curious reason, that "the wisdom of the common law would not have the king (whose continual care and study is for the public, and *circa ardua regni*) to be troubled and disquieted on account of his wife's domestic affairs." In addition to this peculiarity in her domestic position, the queen C. enjoys several exemptions and minute prerogatives. She pays no toll, and is not liable to amercement in any court. But where no such exemption is expressly recognized by law in favor of the royal C., she is on a footing of equality with other subjects, and the privileges which the title conveys are chiefly those of precedence, and belong to court etiquette. Up to the year 1857, the husband of queen Victoria possessed no distinctive English title, and no place in court ceremonial except such as was conceded to him by courtesy. In that year, the title of prince C. was conferred upon him by letters-patent.

CONSPIRACY, a combination between two or more persons to perpetrate an unlawful act. See COMBINATION.

CONSPIRACY BILL. In consequence of an attempt to assassinate the emperor and empress of the French whilst going to the opera on the evening of the 14th Jan., 1858, by the Italian refugee Orsini and others, by means of explosive shells partly manufactured in England, a bill was introduced into parliament by lord Palmerston, declaring conspiracy to murder, which the law of England had hitherto treated as a misdemeanor, to be a felony, punishable with penal servitude, and applying that provision to all persons whether English or foreign, and to all conspiracies to murder wherever intended. In place of being regarded merely as a piece of law reform, the C. B. obtained a political character partly from a dispatch from the French minister, count Walewski, demanding some such change in our law, and partly from expressions contained in certain addresses

which were presented to the emperor by the French army, and published in the government organ, the *Moniteur*, which were regarded as insulting to England. The ministry were accused of truckling to France; and though on the motion for leave to bring in the bill they had a majority of 200 (299 against 99), an amendment by Mr. M. Gibson on the second reading, virtually amounting to a vote of censure, was carried by a majority of 19 against them (234 to 215).

CONSTABLE (Lat. *constabulus*). Whether this officer was called originally *comes stabuli*, the count of the stable or master of the horse (as alleged by Ducange), or the *koning-stapel*, staff and stay of the king (as Coke, Selden, and others, with less reason, have maintained), the C., both in France and England, was a military personage of the very highest rank. The C. of France rose gradually in importance from the comparatively modest position of an officer of the household, till at last he became, *ex officio*, the commander-in-chief of the army in the absence of the monarch, the highest judge in military offenses and in all questions of chivalry and honor, and the supreme regulator and arbitrator in all matters connected with tilts, tournaments, and all martial displays. The office of C. is traced back by Anselme to Alberic, who held it in 1060; but the first C. of France who appeared at the head of an army was Matthew, the second seigneur de Montmorency. The office was suppressed by Louis XIII. in 1626. Among the offices of the ancient monarchy which were restored by Napoleon for mere purposes of state, that of C. was one. His brother, prince Louis Napoleon, afterwards king of Holland, was created grand C., the vice-C. being marshal Berthier. The office was again abolished on the restoration of the Bourbons, and has not since been re-established. But besides the C. of France, almost all the great vassals of the crown had constables who filled analogous offices at their minor courts. There were constables of Burgundy, of Champagne, and of Normandy; the latter of whom may be regarded as the progenitor of the C. of England.

Shortly after the conquest, a lord high C. of England appears, with powers and privileges closely corresponding to those of the C. of France (13 Rich. II. st. 1. c. 2). His position as judge of the court of chivalry, in conjunction with the earl-mareschal, and the limitation of his power, which followed on the statute 13 Rich II. c. 2, are explained under CHIVALRY, COURT OF. The office was abolished by Henry VIII. on the attainder of Edward Stafford, duke of Buckingham; and a lord high C. is now appointed only on the occurrence of great state ceremonies, e.g., a coronation. The high C. of Scotland was an officer very similar to the C. of France and England. After the rebellion, the offices of the inferior constables dependent on the high C., such as the C. of the castle (q.v.), were abolished, but that of the high C. himself was expressly exempted, and still exists in the noble family of Errol. The privileges attaching to this office are now entirely honorary; but in virtue of it, the earl of Errol is said to be the first subject in Scotland after the blood-royal; and on the occasion of the visit of king George IV. to Edinburgh, the then earl was allowed to take precedence of the possessors of all other hereditary honors. The present earl of Errol is the 22d high C. of Scotland.

CONSTABLE OF A CASTLE was the keeper or governor of a castle belonging to the king or to a great baron. These offices were frequently hereditary; thus there were constables or hereditary keepers of the tower, and of the castles of Dover, Windsor, etc. —CONSTABLE OF THE HUNDRED, and CONSTABLE OF THE VILL, were the predecessors of the high and petty constables of later times. The statute of Winchester (13 Ed. I. st. 2, c. 6), by which the office of high constable is usually, though probably not correctly, said to have been first introduced, ordains that in every hundred or franchise there shall be chosen two constables, to make the view of armor, and to see to the conservation of the peace. The petty constable exercised similar functions within the narrower limits of the township or parish, and was subordinate to the high constable of the hundred. The high constables are appointed by the courts leet of the franchise or hundred over which they preside; or, in default of such appointment (7 and 8 Vict. c. 33, s 8), by the justices at their special sessions. The appointment of petty constables is by 5 and 6 Vict. c. 109, and 13 and 14 Vict. c. 20, given to justices, who are directed annually to require from the overseers of parishes a list of those within the parish qualified and liable to serve as constables. When not specially exempted, every able-bodied man, between 25 and 55 years of age, resident in the parish, and rated to the poor or a tenant to the value of £4 per annum, must be included in this list. These lists are to be revised by the justices, who shall choose therefrom such number of persons as they deem requisite. No person who has served shall be liable to serve again till all the others are exhausted. Certain penalties are imposed by the act on those who shall refuse to serve, and an oath of office is prescribed. This act entirely supersedes the ancient method of appointing petty constables.—SPECIAL CONSTABLES are persons sworn in by the justices to preserve the peace, or to execute warrants on special occasions. By 1 and 2 Will. IV. c. 41, and 5 and 6 Will. IV. c. 43, any two justices of the peace who shall learn, on the oath of a credible witness, that a tumult, riot, or felony has taken place, or is apprehended, may, if they are of opinion that the ordinary officers are insufficient, swear in as many householders or others as they may think fit (not belonging to the classes of persons exempted from the duties of ordinary petty constables) to act as special constables for a limited time or for a particular place. The lord-lieuten

ant may also, by direction of one of the principal secretaries of state, cause special constables to be appointed for the whole county, or any part of it, in which case exemptions may be disallowed. For county constabulary, see POLICE.

CONSTABLE (*ante*). In the United States, the duties of constables in regard to keeping the peace and making arrests are generally the same as in England, but generally only petty constables are retained. There was a high constable in New York until about 50 years ago, but the office was merged in that of chief of police. Philadelphia also has had the office of high constable. Some of the states have an official known as constable of the commonwealth.

CONSTABLE, ARCHIBALD, 1774–1827; widely known as a publisher of books in Edinburgh, Scotland. He was a bibliopolist by nature, and before coming of age went into business on his own account. He took great interest in Scottish literature, and the elegance of his publications soon brought him prominently into notice. Among publications wholly or partially under his care were the *Scot's Magazine* and the *Edinburgh Review*. His acquaintance and friendship with sir Walter Scott is well known, and nearly all the works of the great novelist came to the people through Constable's press. Among his latest effort were the purchase and enlarging of the *Encyclopædia Britannica*, and the starting of *Constable's Miscellany*, a series of original standard works to be issued in cheap form. This was continued but a short time, and the firm became heavily in debt and failed in 1826, leaving Walter Scott largely involved in their liabilities.

CONSTABLE, JOHN, 1776–1837; an English artist excelling in landscapes and scenes from nature. Among his pictures are "Stratford Mill," the "Hay Cart," "Salisbury Cathedral," "The Loch," "Valley Farm," and "The Cornfield.

CONSTANCE, LAKE (called by the Germans *Bodensee* or *Bodmansee*, from the old castle of Bodman—the *Lacus Brigantinus* of the Romans), lies on the north side of the Alps of Switzerland, and forms a meeting point of the five territories—Baden, Würtemberg, Bavaria, the Tyrol, and Switzerland. It has an elevation variously estimated at from 1250 ft. to 1385 ft. above the sea. Lake C. is traversed by the Rhine from e. to w.; its greatest length is about 44 m., utmost breadth 9 m., and depth 964 feet. It is divided into the upper and lower lakes, the latter of which extends from Constance to Stein. Anciently, the lake was more extensive toward the s. than now. In the 4th c., it is said to have extended as far as Rheineck, now some miles distant from the shore. The shores are formed by hilly lands, with low tracts at the mouths of the Rhine and smaller rivers. Cornfields, vineyards, pastures, orchards, and wooded declivities, with here and there the ruins of old castles interspersed, surround the lake. The water has a dark-green hue, often rises suddenly some 10 or 12 ft. during a thaw, and rolls in high waves during the prevalence of a strong s., n.w., or e. wind. Without visible cause, it sometimes rises and falls to a considerable degree. In one hour, in 1770, it rose between 20 and 24 feet above the ordinary level. It is seldom frozen, except in very severe winters. The lake contains sixty kinds of aquatic fowl; twenty-five species of fish, including fine salmon and salmon-trout; and several species of shell-fish. Since 1824, steam-navigation has added to the facilities of commerce across the lake, and its commercial importance has been greatly increased by the opening of a railway from Friedrichshafen, by Ulm and Stuttgart, to Heilbronn.

CONSTANCE, or KOSTNITZ (anciently *Constantia*), a city of Baden, once a free imperial city, is situated on the s. shore of the lake of Constance, at the place where the Rhine connects the upper and lower lakes together. C. is one of the most ancient towns in Germany, but it is very much decayed, its pop. once 40,000, being now not more than (1875) 12,096. Its cathedral was erected in the 11th century. C. is notable in history for the ecclesiastical council held in 1414–18. The object of the council of C. was to put an end to the disorders in the popedom and in the election of popes, and also to prevent the spread of the doctrines of Huss. There assembled, with the emperor Sigismund and pope John XXIII., 26 princes, 140 counts, more than 20 cardinals, 7 patriarchs, 20 archbishops, 91 bishops, 600 prelates and doctors, and about 4,000 priests. The three rival popes, John XXIII., Gregory XII., and Benedict XIII., were deposed, and Martin V. was elected. Huss and Jerome of Prague were condemned and burned. The emperor was disappointed in his hope of a thorough ecclesiastical reform, and the council of Basel was afterwards called to carry on the work which the council of C. had failed to accomplish. The hall in which the council met is now the market-hall of Constance. C. has manufactures of silk, cotton, and watches, active fisheries, and the cultivation of vineyards and gardens employs a considerable number of the inhabitants.

CONSTANS, FLAVIUS JULIUS, 320–350; second son of Constantine the great, and emperor of Rome, after having defeated and killed his brother (Constantine II.) at the battle of Aquileia in 340. He was rapacious and profligate, but he protected the Christians and closed many of the pagan temples. His reign became so obnoxious that his troops in Gaul revolted, and sent emissaries to slay him, which they did while he was flying towards Spain.

CONSTANT is the name given, in mathematical analysis, to a quantity which remains the same for all cases of the problem, in opposition to a variable. Thus, in questions about the fall of bodies in given times, the force of gravity is a constant quantity. In the integral calculus, the name of constants is given to those quantities which, after integration, are annexed to the integral.

CONSTANT DE REBEQUE, HENRI BENJAMIN, one of the most distinguished political writers and orators of France, was b. at Lausanne on the 25th Oct., 1767. Educated in a German college, he afterwards spent some time at Edinburgh university, and here he is supposed to have imbibed those ideas of political freedom which guided him through life. In 1796, he published in Paris a pamphlet on the government then existing, which brought him into note; and three years later, he was placed on the "tribunat" by Napoleon, who, however, two years after, dismissed and banished him for the spirit he displayed in resisting the first consul's encroachments on liberty. During his banishment, he traveled for some time with Madame de Staël, and afterwards settled in Germany. In 1813, he published his celebrated pamphlet, *On the Spirit of Conquest and Usurpation*. In 1814, he returned to Paris, where he wrote several pamphlets in favor of constitutional liberty, which he maintained was enjoyed under Louis XVIII. Napoleon's government he described as a "government of Mamelukes," and the emperor himself as "a Genghis khan." Yet during the hundred days he became a councillor of state, and assisted in framing the *Acte Additionnel*. In 1819, he was elected a deputy, became ultimately leader of the opposition, and in this capacity gained unbounded popularity. C. de R. was a true patriot. He loved liberty better than monarchies or mobs, and therefore, while he opposed the despotic measures of the government of Charles X., he deplored the revolution of July, 1830. He died Dec., 1830. As a public speaker, C. de R. was in his day the clearest and most persuasive advocate of constitutional principles in France. As a political writer, he was even fully more effective than as a speaker. Among his works may be mentioned *Discours Prononcés à la Chambre des Députés* (2 vols., Par. 1828); the *Cours de Politique Constitutionnelle* (4 vols., Par. 1817–20, 2d ed., 1833), in which are collected his minor works on representative government. Among his most ambitious works are *Mémoires sur les Cent Jours* (Par. 1820); *De la Religion considérée dans sa Source, ses Formes, et ses Développements* (5 vols., Par., 1824–31), to which posthumous work his *Du Polythéisme Romain, considéré dans ses Rapports avec la Philosophie Grecque et la Religion Chrétienne*, forms a kind of supplement.

CONSTAN'TIA, a district of Cape Colony, in South Africa, lying on the eastern and n.e. slopes of Table mountain range, and distant from Cape Town about 12 miles. C. consists of only two estates, Great Constantia and Little Constantia, which have long been famed for the quality of the wines produced upon them. Many attempts have been made in other parts of Cape Colony, as also in France and the s. of Europe, to produce a wine similar in quality and flavor to the C., but all have failed; and it is now known that not only to the quality of the C. grape, but also to the character of the soil, as well as to the peculiarly genial exposure of the district, the characteristic excellence of the C. (proper) wines is traceable. The soil of the estates is rich in alkalies to an extent perceptible in the grape itself, and the vineyards have a very equable exposure, being sheltered from all sudden changes of temperature by spurs of the great granite mountain. The grapes under this shelter ripen very uniformly, so that the earthy taste, which spoils the character of other cape wines, and which is produced by using unpicked grapes of different degrees of ripeness in the same bunch, does not attach to the C. wines.

Although the attempts made on other farms in the colony to produce wine similar to that of C., have failed in so far as the peculiar flavor as well as lusciousness of real C. are concerned, yet they have led of late to great improvements in the quality of several of the South African wines; and where care continues to be bestowed, and the habits of different vines in relation to soil and exposure are more studied, we have evidence in the quality of the improved "Pontac," and other wines of Wynberg, of what can be accomplished with increased labor by Cape Colony as a wine-producing country. Statistics of the wine trade of this settlement show, however, that only a small quantity of genuine wines finds its way into the market—much of that which passes under the name being similar but inferior cape wines. The produce of the C. vineyards sells even in the colony at not less than 6*s.* per bottle.

CONSTANTI'NA, a t. of Spain, in Andalusia, situated in a mountainous district, about 40 m. n.n.e. of Seville, to which city it supplies much fruit and ice. It has manufactures of leather and soap, distilleries, flour-mills, etc. Pop. 7,000.

CONSTANTINE, the capital of a province of the same name (the easternmost province of the French colony of Algeria), is situated on a hill with flat summit, three sides of which are washed by the Rummel, flowing through a deep and narrow ravine, and the fourth is connected by a natural mound with the surrounding mountains. Lat. 36° 22′ n., long. 6° 37′ east. It is 830 ft. above the river, and 2,162 ft. above the sea. It is surrounded by walls constructed by the Arabs out of Roman sculptured stones, and a fine old Roman bridge spans the ravine on one side The streets, as in the other towns of Barbary, are very narrow and dirty, and the houses mean. An old church in the Byzantine style is included in the citadel. C. was anciently one of the most important

towns of Numidia, called *Carta* by the Carthaginians, *Cirta* by the Romans, and was long a royal residence. It was destroyed in the wars of Maxentius against Alexander about 311 A.D., but was soon rebuilt by Constantine the great, from whom it derives its present name, and continued to subsist, and was a flourishing town in the 12th century. Subsequently, it shared in general the fortunes of Algeria (q.v.). C. has manufactures of woolen cloths, saddlery, and other articles of leather. Pop. '72, 33,251, of whom some 7,000 are Europeans.

CONSTANTINE I., FLAVIUS VALERIUS AURELIUS, surnamed "the great," a Roman emperor, was b. 272 or 274 A.D., at Naissus, in Mœsia. He was the eldest son of Constantius Chlorus, and first distinguished himself by his military talents under Diocletian, in that monarch's famous Egyptian expedition, 296; subsequently he served under Galerius in the Persian war. In 305, the two emperors, Diocletian and Maximian, abdicated, and were succeeded by Constantius Chlorus and Galerius. Galerius, who could not endure the brilliant and energetic genius of C., took every means of exposing him to danger, and it is believed that this was the period when he acquired that mixture of reserve, cunning, and wisdom, which was so conspicuous in his conduct in after-years. At last C. fled to his father, who ruled in the west, and joined him at Boulogne just as he was setting out on an expedition against the Picts in North Britain. Constantius died at York, July 25, 306, having proclaimed his son C. his successor. The latter now wrote a conciliatory letter to Galerius, and requested to be acknowledged as Augustus. Galerius did not dare to quarrel with C., yet he granted him the title of Cæsar only. Political complications now increased, and in a short time no less than six emperors were "in the field"—viz., Galerius, Licinius, and Maximin in the east, and Maximian, Maxentius his son, and Constantine in the west, 308 A.D. Maxentius having quarreled with his father, forced him to flee from Rome; he took refuge with C., but was ungrateful enough to plot the destruction of his benefactor. This being discovered, he fled to Marseilles, the inhabitants of which city gave him up to C., who put him to death, 309 A.D. Maxentius professed great anger at the death of his father, and assembled a large army, with which he threatened Gaul. Crossing the Alps by Mont Cénis, C. thrice defeated Maxentius—first near Turin, then under the walls of Verona, and finally in the vicinity of Rome, 28th Oct., 312, Maxentius himself in the last of these engagements being drowned in an attempt to escape across the Tiber. C. now entered the capital, disbanded the Prætorians, and adopted other judicious measures for allaying the public exitement. He was also honored with the title of *pontifex maximus*, or supreme dignitary of the pagan hierarchy.

C. was now sole emperor of the west. Similarly, by the death of Galerius in 311, and of Maximin in 313, Licinius became sole emperor of the east. In 314, a war broke out between the two rulers, in which Licinius had the worst, and was fain to conclude a peace by the cession of Illyricum, Pannonia, and Greece. C. gave Licinius his sister Constantina in marriage, and for the next nine years devoted himself vigorously to the correction of abuses in the administration of the laws, to the strengthening of the frontiers of his empire, and to the chastising the barbarians, who learned to fear and respect his power. In 323, he renewed the war with Licinius, whom he defeated, and ultimately put to death. C. was now at the summit of his ambition, the sole governor of the Roman world. He chose Byzantium for his capital, and in 330, solemnly inaugurated it as the seat of government, under the name of Constantinople or City of Constantine. In 324, he committed a deed that has thrown a dark shade over his memory. He had a gallant and accomplished son, named Crispus, who was exceedingly popular, and him, along with Constantina and others, he put to death on a charge of treason. Niebuhr shows that it was not unlikely Crispus cherished ambitious designs. Next year occurred the great council of Nice. C. sided with the orthodox fathers, probably for very heterodox reasons. As yet he was a pagan, but his sense of justice, and his conviction of the growing importance of the Christians, both as a moral and political element in the life of the empire, had from the very first induced him to protect them. As early as 313, he had everywhere granted them toleration, and since then continued to favor them more and more decidedly. As president of the Nicene council, he opposed the Arians, on political grounds, as the weaker party; but not being theologically interested in the dissensions, he refrained from active persecution. During the latter years of his life, Christianity became the state religion, the pagan temples were closed, and sacrifices forbidden. Yet it was only a short time before his death, which occurred 22d July, 337, that he would allow himself to be baptized.

The question has been much discussed, whether or not C. was a Christian. The truth seems to be, that he looked upon religion as a *statesman*, who feels that his first duty is to rule the nation over which he is set in an orderly and peaceable manner. Had paganism been still in its prime, and possessed any real political vitality, it is not likely that a man of C.'s secular temperament would have troubled himself in regard to the new faith; but when he found that the latter was making rapid progress in spite of the fiercest persecution, he must have felt it wisest, and probably also conceived it *right*, to protect and favor it. But he continued to the last addicted to many pagan superstitions. As an emperor, however, he ranks very high. He was beloved by his people, for whose welfare he seems to have honestly labored. Severe

and even sanguinary towards individuals, he was just and moderate towards nations. He conquered every enemy, organized a new and better mode of government for his vast dominions, crushed all conspiracies and revolts, and passed the close of his life in peace.

CONSTANTINE II., 312–40; eldest son of Constantine the great. On the death of his father the empire was divided between the three surviving sons, but Constantine II. being the eldest was considered the emperor.

CONSTANTINE VII., PORPHYROGENITUS, 905–59; Roman emperor of the east, son of Leo VI. He paid more attention to literature than to state affairs, leaving the latter to his wife Helena. It is reported that he was poisoned by his son Romanus, who was his successor. He wrote a life of his grandfather, Basil I., a work on government, for the instruction of his son, and several other treatises.

CONSTANTINE XIII., PALÆOLOGUS, the last of the emperors of the east, b. 1394; killed at the capture of Constantinople in 1453. When Mohammed II. set about the taking of Constantinople and the final subjugation of the eastern empire, Constantine appealed in vain to the princes of Christendom. A long siege preceded the capture of the city, but it was accomplished May 29, 1453, and Constantine was slain by some unknown hand. The body was recognized and the head was brought to Mohammed, but he gave the body an honorable burial.

CONSTANTINE, NICOLAEWITCH, grand-duke of Russia, b. 21st Sept., 1827, is the second son of the late emperor Nicholas, and the brother of Alexander II. He is grand-admiral of the Russian fleet, and holds besides innumerable military offices. During the Crimean war, he commanded the Russian fleet in the Baltic, and directed the defensive preparations which held the English and French armaments in check before Cronstadt. The leader of the old Russian party, he strenuously opposed the concessions made to the western powers. In 1857, however, he visited the courts of England and France, and in 1871, he paid a second visit to England. On the outbreak of the Polish insurrection in 1862, C. held the office of viceroy of Poland for three months. In Jan., 1865, he was appointed president of the council of the empire.

CONSTANTINE, PAULOWITCH, a Russian grand-duke, b. 8th May, 1779, was the second son of the emperor Paul I. He early distinguished himself by activity, intellectual ability, and a gallantry bordering on foolhardiness, of which he gave remarkable proof at the battle of Austerlitz. After the congress of Vienna, the government of Poland was intrusted to him by his brother, the emperor Alexander. In Jan., 1822, he executed a private deed by which he resigned his claims to the throne in the event of Alexander's death; and when that event took place in 1825, he adhered to this resignation, although he had meanwhile in his absence been proclaimed emperor in St. Petersburg. The succession thus fell to his younger brother Nicholas. The character of C.'s administration in Poland was not such as to conciliate any class of the people, and a widely ramified conspiracy was formed. The French revolution of 1830 supplied the spark which set all in flame, and C. was obliged to flee for his life, but he returned in command of the army of reserve. He died, however, of cholera at Vitebsk, on 27th June, 1831.

CONSTANTINO'PLE, called by the Turks *Stamboul* or *Istamboul*, was originally called *Byzantium* (q.v.). In 330 A.D., the emperor Constantine made it the capital of the Roman empire, and called it after his own name, Constantinople. From this period dates its importance. It continued thenceforth to be the residence of the Roman, and afterwards of the Byzantine emperors, till in 1453 it was taken by the Turks. Since that time it has been the capital of Turkey, and the principal residence of the sultans. It is situated in lat. 41° n., and long. 28° 59′ e., on the European side of the channel of Constantinople or Thracian Bosporus, near to its opening into the sea of Marmora. A narrow arm of the sea, called the Golden Horn, extends about 5 m. into the land, and forms a safe and most commodious harbor, with water of sufficient depth to float the largest men of war. C. proper, to which Europeans give the name of Stamboul to distinguish it from the northern and eastern suburbs of C., lies entirely on the southern side of the Golden Horn, and is protected by a wall built during the time of the Byzantine empire, and partially restored by the Turks. The wall is about 12½ m. in circuit, and is pierced by 28 gates, amongst which that of Top-Kapussi, formerly that of St. Romanus, has a historic interest, as being the one through which the Turks entered when they stormed the city, and where the last of the Palæologi died in the fight. The suburbs of Galata, Pera, and Top-hanĉh are situated on the northern side of the Golden Horn On the Asiatic side of the Bosporus lie Scutari and Kadiköi (the ancient Chalcedon), and to the n.w. of the city lies the town of Eyub. The city itself is built on hilly ground, and from this circumstance, and its numerous gardens, cypresses, mosques, palaces, minarets, and towers, it presents, especially as seen from the side of the Golden Horn, a very spendid appearance. The scenery of the Thracian Bosporus is of almost unrivaled beauty; and the panorama, of which C. forms the principal part, is such as is perhaps nowhere else to be seen in the world. But a nearer approach reveals the characteristics of an eastern town—narrow, crooked, filthy streets, and miserable houses of wood and clay. Since the Crimean war, however, C. has been wonderfully improved. Great

fires, which occurred on the 6th and 7th Sept., 1865, the 3d May, 1866, and on 5th June, 1870, swept away square miles of old wooden houses on both sides of the Golden Horn. On these spaces handsome stone houses have been built in the modern European style; but this has not been done with much system, and there are in all directions great gaps filled with miserable wooden huts, or left as waste places. The formation of tramways has, however, tended to connect the improved districts by wider thoroughfares, and to form a general plan which is gradually giving to C. the appearance of a European city. C. contains many fine buildings, among which may be mentioned the Seraglio, occupying the position of ancient Byzantium, and measuring about 3 m. in circumference; the former church of St. Sophia, now a mosque, is a most magnificent structure, in the form of a Greek cross, 269 ft. long by 243 broad, and has a flattened dome, greatly admired for its lightness, 180 ft. above the ground. The other important mosques are those of Solyman, Achmed, Sultan Mohammed II. and Eyub. The two obelisks of the ancient hippodrome, called by the Turks the *Atmeïdan;* the castle of the seven towers, now in a state of dilapidation; the aqueducts erected by the emperor Valens; the cistern of Philoxenus, with 424 columns of marble; and the numerous fountains, are among the other most notable objects of Constantinople. The covered bazaars of C. are very numerous, and the goods are displayed with wonderful attractiveness. One feature of C. is its vast number of lean and hungry dogs, which haunt the streets. The dogs are the common property of the city, and they do a considerable portion of the scavenging. Galata, which was founded by the Genoese as a republic in the Byzantine times, is the residence of European merchants and the principal place of trade. It contains many great warehouses, shops, andd welling-houses, but is, if possible, even more filthy than C. proper. Bridges of boats connect the opposite sides of the Golden Horn. Further eastward, on the Bosporus, lies Top-hanêh, with the imperial cannon foundry, a beautiful mosque, and an interesting fountain. On the hill behind Galata and Top-hanêh, is situated Pera, the residence of the foreign ambassadors. Two thirds of Pera were burned to the ground by the fire of 5th June, 1870. Three thousand houses were then entirely destroyed, including that of the English ambassador; and 40,000 persons were left without shelter. Before the fire, Pera had a European pop. of 70,000, which was reduced by the catastrophe to more than one half. Pera is not being rebuilt on its old site, but new streets are spreading round it and Galata. In 1875, Pera was connected with C. by an underground railway 672 yards long, which is reckoned to convey 30,000 passengers daily.

The population of C. and its suburbs has been variously estimated. In 1873, it probably contained from 750,000 to 800,000 inhabitants, of whom about one half were Mohammedans, one fourth Greeks and Armenians, one eighth Franks, and one eighth Jews. The mosques are more than 300 in number. There are several Greek churches, under a patriarch, with twelve synodal bishops. The patriarch is not only the spiritual, but in part also the temporal head of the Greek subjects of the porte. C. is the residence also of an Armenian patriarch, and there are several Roman Catholic and Protestant places of worship. There are in connection with the mosques about 300 *medresses*, or schools for the ulemas; there are also some 400 *mekteb*, or Turkish elementary schools; and among the other educational institutions is a school of medicine conducted by Germans, which has been the means of much good. Among the benevolent institutions are numerous *imarets*, where food is provided for the poor, and hospitals for the sick of several European nations. There are public libraries, both Turkish and Greek, of which that of the Seraglio is particularly rich in the treasures of oriental literature; and there are several Turkish and European printing-presses. The public baths and coffee-houses are exceedingly numerous. Some of the peculiar manufactures of the east are carried on in leather, carpets, weapons, etc. But all the manufactures of western Europe abound in its markets. The trade of C. has, since the Crimean war, been steadily increasing, but is by no means so extensive as might be expected from its population and situation. The burden of the vessels entering and of those clearing the port is estimated at about four millions of tons. The trade is chiefly in the hands of Greeks, Italians, Austrians, British, French, and Germans.

The great strategical value of the site of C. has always lent it a peculiar military and political importance. Extensive fortifications at some distance on the landward side of C. were undertaken during the Russian war of 1877, and were carried out under the superintendence of an English officer in the Turkish service. These lines extend from Buyuk-Tchekmedgi on the sea of Marmora to lake Derkos on the Black sea, a distance of about 20 miles. They run along a range of steep hills, from 200 to 500 ft. in height, looking down on a long and wide bare valley. Eight miles distant across the valley runs the parallel range of the Tchataldja hills, from 500 to 1500 ft. high.

C. is now connected by railway with the interior of northern Turkey, and the north-western part of Asia Minor. The Roumelian railway from Stamboul to Bellova was opened in 1873, and will ultimately be connected with the Schumla-Varna line, and with that from Saloniki to Uskub. C. will thus soon have railway communication with a great part of Turkey.

CONSTANTINOPLE, COUNCILS OF. Eight have been held which are recognized as ecumenical either by the Greek or Latin church, or by both. The *first* was the 2d

ecumenical council of the church, convened in 381 by the emperor Theodosius I. to legalize his violent ejectment of the Arians from the eastern churches. It consisted of 150 bishops, chosen under the dictation of the emperor and chiefly from the east, besides the semi-Arians, followers of Macedonius of Constantinople, who withdrew after their opinions had been condemned. This council condemned also the Arians, Eunomians, and Eudoxians; it reaffirmed the resolutions of the council of Nice, and declared that the bishop of Constantinople, or new Rome, was, of right, next in rank to the bishop of old Rome; both of them being alike subject only to the emperor. The *second* was the 5th ecumenical council of the church, convened in 553 by Justinian I. to sustain his condemnation of three distinguished teachers of the Antiochian school whose opinions had been collected into "three chapters." There were 165 bishops, mostly eastern, in attendance. They condemned the "three chapters" and included in the sentence Vigilius, bishop of Rome, because he would not condemn them absolutely. The *third* was the 6th ecumenical council, held in 680, and consisting of 289 bishops, including three eastern patriarchs and four Roman legates. Through the influence of the legates, the council condemned the doctrine of Honorius that "as there was only one Christ, so he had only one will," and recognized in him, consistently with the doctrine of two natures in one person, two wills made one by the moral subordination of the human to the divine. The *fourth* was the council held in 691, by command of Justinian II. It is recognized as ecumenical only by the Greeks, and is called "*quinisextum*" because it supplemented the 5th and 6th. It passed more than one hundred canons concerning the morals of the clergy and church discipline. The *fifth* was held in 754 and attended by 383 bishops. It is recognized only by the Greeks. It issued a decree against image worship, which was revoked in 786 by the 2d ecumenical council of Nice. The *sixth* was held in 869, and is recognized only by the Latin church. It deposed the patriarch Photius, restored Ignatius, and enacted laws concerning church discipline. The *seventh* was held in 879. There were 380 bishops present, including the Roman legates. It recalled Photius, repealed the action of the preceding council against him, and defined the position of the patriarch of Constantinople in relation to the pope. The *eighth* was held in 1341, and is called by the Greeks the 9th ecumenical. It condemned Barlaam, an educated monk, as heretical in opposing the monks of mount Athos, who asserted the possibility of attaining, while yet in the body, an intuition of the divine light and essence by a perfect cessation of corporeal life.

CONSTAN'TIUS, or CONSTANTIUS CHLORUS, FLAVIUS VALERIUS, 250–306 A.D.; Emperor of Rome and father of Constantine the great. He became emperor in 305, when Diocletian abdicated, and ruled over Gaul, Spain, and Britain.

CONSTAN'TIUS, FLAVIUS JULIUS, b. 317 A.D. He inherited by his father's will the Asiatic provinces and Egypt. He made war upon the Persians, but was defeated. He was favorable to the Arians, and gave the title of cæsar (emperor) to his cousin and successor Julian.

CONSTELLA'TION (Lat. *con*, together, and *stella*, a star), a group of stars. The stars which stud the firmament have, from a time earlier than authentic records can trace, been formed into artificial groups, which have received names borrowed from fancy or fable. These groups are called constellations. Though quite devoid of anything like systematic arrangement, this traditional grouping is found a sufficiently convenient classification, and still remains the basis of nomenclature for the stars among astronomers. Before the invention of almanacs, the risings and settings of the constellations were looked to by husbandmen, shepherds, and sea-faring men as the great landmarks of the seasons, and consequently of the weather which each season was expected to bring with it (see Job xxxviii. 31); and it is not surprising if the storms or calm weather that usually accompanied such seasons were connected, in the popular imagination, with the influence of the stars themselves, or the beings with whom superstition or fable identified them. Thus, the risings and settings of Bootes with the bright star Arcturus, which took place near the equinoxes, portended great tempests. See Virgil's *Georgics*, i. 204. The great heat in July was ascribed to the rising of Canis the dog, with its bright star Sirius. See CANICULAR DAYS; and HELIACAL RISING. The appearance of the twins, Castor and Pollux, was hailed as the harbinger of fair summer weather.

Almost all nations have, from early times, arranged the stars into constellations, but it is chiefly from the nomenclature of the Greeks and Romans that our own is derived. Eudoxus, a contemporary of Plato, about 370 years B.C., gave a description of the face of the heavens, containing the names and characters of all the constellations recognized in his time. Though this production is lost, a poetical paraphrase of it, written about a century later by Aratus (q.v.), is still extant. This poem describes twelve zodiacal constellations (see ZODIAC), with twenty in the northern hemisphere, and thirteen in the southern. The next enumeration occurs in the *Almagest* of Ptolemy, which includes the preceding, with three additional, one northern and two southern constellations, making in all 48. These are the ancient stellar groups. Large accessions have been made to the nomenclature in modern times, in consequence of maritime discovery having made us acquainted with constellations in the southern hemisphere which never rose upon the world known to our ancient authors. In 1751, Lacaille went to the cape for the purpose of making a catalogue of the southern stars, and forming them into constel-

lations—an undertaking which he prosecuted with great ardor for nearly four years at the expense of the French government. Flattery has also contributed towards the stellar nomenclature. Upon the restoration of Charles II., the evening before his return to London, sir Charles Scarborough, the court physician, was gazing upon a star in the northern heavens, which shone with greater luminosity than usual, as might be expected from a loyal star on such an occasion. This, in connection with a few others, was formed into Cor Caroli, the heart of Charles II., by Halley, at the doctor's recommendation. The chief constellations will be noticed under their several names. See ARIES, URSA MAJOR, etc. The fanciful figures from which the constellations are named, are depicted on celestial globes and maps of the heavens. In the older writers, C. signifies the relative positions of the planets at a given moment. See ASPECT.

CONSTIPA'TION, a state of the system marked by an irregular and sluggish action of the bowels upon their contents, due either to defective secretion of the juices of the intestinal mucous membrane, or to an imperfection of the peristaltic movements (see DIGESTION). Sedentary habits predispose to C., as also does the use of animal food in too great a relative amount The use of brown bread, or of lentils, oatmeal porridge, of green vegetables and salads, or of ripe fruits; the plentiful employment of salt or of saline drinks, or of many natural mineral waters; and active exercise, especially by walking or riding on horseback in the open air, tend to avert this disease. A favorite remedy with some is the use of a cloth wrung out of cold water, and applied to the abdomen; this, as used at hydropathic establishments, is called an "abdominal compress," and is worn under a bandage of macintosh cloth, to keep the moisture from escaping, during the earlier part of the day. But to many persons affected with C., and unable from circumstances to follow out the plan of life here indicated, and to many others in whom the disease does not yield to these means, the use of laxatives, or mild cathartics (q.v.), is almost a necessity; and it is satisfactory to know that these remedies, if judiciously selected, and not employed so as to produce over-action, may be taken during very many years without any of the bad effects often ascribed to them.

Constipation in the lower animals depends, as in man, on imperfect secretion from, or motion of, the intestinal walls. In the horse, it is usually accompanied by colic (q.v.), and when long continued, leads to enteritis (q.v.). The appropriate remedies are soap and water clysters, given every two hours; smart friction and cloths wrung out of hot water applied to the abdomen, with three drachms of aloes, and one of calomel, given in gruel, and repeated in sixteen hours, if no effect is produced. Give, besides, walking exercise; restrict the amount of dry solid food, but allow plenty of thin gruel or other fluids, which may be rendered more laxative by admixture with treacle or a little salt. Similar treatment is called for in dogs, cats, and pigs. In cattle and sheep, digestion principally takes place in the large and quadrisected stomach; the bowels, accordingly, are little liable to derangement; and C., when occurring in these animals, generally depends upon impaction of dry hard food between the leaves of the maniples, third stomach, or fardel-bag. The complaint is hence called *fardel-bound.* It results from the eating of tough and indigestible food, such as ripe vetches, rye-grass, or clover; it prevails in dry seasons, and on pastures where the herbage is coarse and the water scarce. It occurs amongst cattle partaking freely of hedge-cuttings or shoots of trees, hence its synonym of *wood-evil.* From continuous cramming and want of exercise, it is frequent in stall-feeding animals; whilst from the drying up of the natural secretions, it accompanies most febrile and inflammatory diseases. The milder cases constitute the ordinary form of indigestion in ruminants, are accompanied by what the cow-man terms *loss of cud,* and usually yield to a dose of salts given with an ounce or two of ginger. In more protracted cases, rumination is suspended, appetite gone, constipation and fever are present. There is a grunt noticeable, especially when the animal is moved, and different from that accompanying chest-complaints, by its occurrence at the commencement of *expiration.* By pressing the closed fist upwards and forwards beneath the short ribs on the right side, the round, hard, distended stomach may be felt. This state of matters may continue for ten days or a fortnight, when the animal, if unrelieved, becomes nauseated, and sinks. Stupor sometimes precedes death, whilst in some seasons and localities most of the bad cases are accompanied by excitement and frenzy. In this, as in other respects, the disease closely corresponds with stomach-staggers in the horse.

Treatment.—Give purgatives in large doses, combining several together, and exhibiting them with stimulants in plenty of fluid. For a medium-sized ox or cow, use ¾ lb. each of common and Epsom salts, ten croton beans, and a drachm of calomel, with 3 ozs. of turpentine; and administer this in half a gallon of water. If no effect is produced in twenty hours, repeat the dose. Withhold all solid food; encourage the animal to drink gruel, sloppy mashes, treacle and water; and give exercise, clysters, and occasional hot fomentations to the belly.

CONSTITUENT ASSEMBLY. See ASSEMBLY, NATIONAL.

CONSTITUTION, in politics (*constitutio,* from Lat. *constituere,* to set up, or establish). In its modern acceptation, C. signifies a system of law established by the sovereign power of a state *for its own guidance.* Such being the ultimate object of a C., its proximate objects, generally stated, are, to fix the limits and define the relations of the

legislative, the judicial, and the executive powers of the state, both amongst themselves and with reference to the citizens of the state, regarded as a governed body. Among the Romans, a C. was at first nearly synonymous with the edict of a prætor (see EDICT), and even under the empire signified only an imperial edict or decree. In continental countries, since the formation of the federal government of the United States of America, or, at all events, since the first French revolution, the idea of a C. has been generally that of a body of written public law, promulgated at once by the sovereign power. See CODE and ASSEMBLY, NATIONAL. In Great Britain it is the whole body of the public law, consuetudinary as well as statutory, which has grown up during the course of ages, and is continually being modified by the action of the general will as interpreted and expressed by the parliamentary representatives of the nation. Much confusion is often introduced into our conceptions of the action of the English and other mixed governments by representing the three elements of which they are generally composed—the monarchical, aristocratic, and democratic (king, lords, and commons)—as the centers of three independent sovereignties, whereas they are only three organs through which the one sovereignty finds expression. There is, and can be, in an independent state, but one sovereignty—one center of power—viz., the general will of the nation. Opposition to this will, from whencesoever it may come, within the state, is treason in the individual, and rebellion in the mass; whereas the vindication of this will by its own act may be revolution, but can never be rebellion. Another source of error consists in supposing this general will to be the numerical aggregate of all the individual wills in the community. It is, on the contrary, the sum of all the wills, not numerically but really, making allowance, that is to say, for the fact that one individual, from the greater clearness of his convictions and strength of his character, often contributes to this sum, or mass of volition, ten times as much as another individual.

But though the idea of a mixed government is generally associated with that of a C., it does not seem to be inseparable from it. We are not entitled, for example, to deny the name of a C. to a system which is apparently the result of one single will, if to that will the general will has freely confided the task of determining the rules by which it shall be governed. Assuming that the late emperor of the French was invested with supreme power by this ultimate sovereign, the general will, the government which he established was, for the time being, the C. of France. But inasmuch as France had, under the imperial system of government, no parliamentary machinery for effecting desired or desirable changes in its C., the "right of revolution," as it is called, became a necessity on the part of those who conceived that they embodied and were in a condition to express the general will. Disorderly as it may seem to us, it was really within the limits of the C., as constitutional as the C. which at any moment it might have overthrown. In a parliamentary government like that of England, however, the right of revolution emerges only when the self-modifying powers of the C. are obstructed or opposed by the executive, as took place in 1688. Whilst in pure monarchies it hangs permanently over the head of the executive, even when acting in accordance with the C., in a free country resistance is rebellion in all cases in which the machinery which the C. possesses for its own modification is unimpeded in its action. Of resistance of this latter kind, the events that culminated in the late American civil war furnish an example.

For a historical account of the English C., see ENGLAND; see also PARLIAMENT, CONGRESS, CODE, CORTES, etc.

CONSTITUTION (*ante*), the organic law under which the national government, and the several state governments, in the United States are carried on. The Constitution of the United States is as follows:

We, the people of the United States, in order to form a more perfect union, establish justice, insure domestic tranquillity, provide for the common defense, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity, do ordain and establish this constitution for the United States of America.

ARTICLE I., Sec. 1. All legislative powers herein granted shall be vested in a congress of the United States, which shall consist of a senate and house of representatives.

Sec. 2. The house of representatives shall be composed of members chosen every second year by the people of the several states, and the electors in each state shall have the qualifications requisite for electors of the most numerous branch of the state legislature.

No person shall be a representative who shall not have attained to the age of twenty-five years, and been seven years a citizen of the United States, and who shall not, when elected, be an inhabitant of that state in which he shall be chosen.

Representatives and direct taxes shall be apportioned among the several states which may be included within this union according to their respective numbers, which shall be determined by adding to the whole number of free persons, including those bound to service for a term of years, and excluding Indians not taxed, three fifths of all other persons. The actual enumeration shall be made within three years after the first meeting of the congress of the United States, and within every subsequent term of ten years, in such manner as they shall by law direct. The number of representatives shall not exceed one for every thirty thousand, but each state shall have at least one representa-

tive; and until such enumeration shall be made, the state of New Hampshire shall be entitled to choose 3; Massachusetts, 8; Rhode Island and Providence Plantations, 1; Connecticut, 5; New York, 6; New Jersey, 4; Pennsylvania, 8; Delaware, 1; Maryland 6; Virginia, 10; North Carolina, 5; South Carolina, 5; and Georgia, 3.

When vacancies happen in the representation from any state, the executive authority thereof shall issue writs of election to fill such vacancies.

The house of representatives shall choose their speaker and other officers; and shall have the sole power of impeachment.

Sec. 3. The senate of the United States shall be composed of two senators from each state, chosen by the legislature thereof, for six years; and each senator shall have one vote.

Immediately after they shall be assembled in consequence of the first election, they shall be divided as equally as may be into three classes. The seats of the senators of the first class shall be vacated at the expiration of the second year, of the second class at the expiration of the fourth year, and of the third class at the expiration of the sixth year, so that one third may be chosen every second year; and if vacancies happen by resignation, or otherwise, during the recess of the legislature of any state, the executive thereof may make temporary appointments until the next meeting of the legislature, which shall then fill such vacancies.

No person shall be a senator who shall not have attained to the age of thirty years, and been nine years a citizen of the United States, and who shall not, when elected, be an inhabitant of that state for which he shall be chosen.

The vice-president of the United States shall be president of the senate, but shall have no vote, unless they be equally divided.

The senate shall choose their other officers, and also a president *pro tempore*, in the absence of the vice-president, or when he shall exercise the office of president of the United States.

The senate shall have the sole power to try all impeachments; when sitting for that purpose, they shall be on oath or affirmation. When the president of the United States is tried, the chief-justice shall preside; and no person shall be convicted without the concurrence of two thirds of the members present.

Judgment in cases of impeachment shall not extend further than to removal from office, and disqualification to hold and enjoy any office of honor, trust, or profit under the United States; but the party convicted shall nevertheless be liable and subject to indictment, trial, judgment, and punishment, according to law.

Sec. 4. The times, places, and manner of holding elections for senators and representatives shall be prescribed in each state by the legislature thereof; but the congress may at any time, by law, make or alter such regulations, except as to the places of choosing senators.

The congress shall assemble at least once in every year, and such meeting shall be on the first Monday in Dec., unless they shall, by law, appoint a different day.

Sec. 5. Each house shall be the judge of the elections, returns, and qualifications of its own members, and a majority of each shall constitute a quorum to do business; but a smaller number may adjourn from day to day, and may be authorized to compel the attendance of absent members, in such manner and under such penalties as each house may provide.

Each house may determine the rules of its proceedings, punish its members for disorderly behavior, and, with the concurrence of two thirds, expel a member.

Each house shall keep a journal of its proceedings, and from time to time publish the same, excepting such parts as may in their judgment require secrecy, and the yeas and nays of the members of either house on any question shall, at the desire of one fifth of those present, be entered on the journal.

Neither house, during the session of congress, shall, without the consent of the other, adjourn for more than three days, nor to any other place than that in which the two houses shall be sitting.

Sec. 6. The senators and representatives shall receive a compensation for their services, to be ascertained by law, and paid out of the treasury of the United States. They shall in all cases, except treason, felony, and breach of the peace, be privileged from arrest during their attendance at the session of their respective houses, and in going to and returning from the same; and for any speech or debate in either house they shall not be questioned in any other place.

No senator or representative shall, during the time for which he was elected, be appointed to any civil office under the authority of the United States, which shall have been created, or the emoluments whereof shall have been increased during such time; and no person holding any office under the United States shall be a member of either house during his continuance in office.

Sec. 7. All bills for raising revenue shall originate in the house of representatives; but the senate may propose or concur with amendments, as on other bills.

Every bill which shall have passed the house of representatives and the senate, shall, before it become a law, be presented to the president of the United States; if he approve, he shall sign it; but if not, he shall return it, with his objections, to that house in which it shall have originated, who shall enter the objections at large on their jour-

nal, and proceed to reconsider it. If after such reconsideration two thirds of that house shall agree to pass the bill, it shall be sent, together with the objections, to the other house, by which it shall likewise be reconsidered; and if approved by two thirds of that house, it shall become a law. But in all such cases, the votes of both houses shall be determined by yeas and nays, and the names of the persons voting for and against the bill shall be entered on the journal of each house respectively. If any bill shall not be returned by the president within ten days (Sunday excepted) after it shall have been presented to him, the same shall be a law in like manner as if he had signed it, unless the congress by their adjournment prevent its return; in which case it shall not be a law.

Every order, resolution, or vote to which the concurrence of the senate and the house of representatives may be necessary (except on a question of adjournment) shall be presented to the president of the United States; and before the same shall take effect, shall be approved by him, or, being disapproved by him, shall be repassed by two thirds of the senate and house of representatives, according to the rules and limitations prescribed in the case of a bill.

Sec. 8. The congress shall have power to lay and collect taxes, duties, imposts, and excises, to pay the debts and provide for the common defense and general welfare of the United States; but all duties, imposts, and excises shall be uniform throughout the United States;

To borrow money on the credit of the United States;

To regulate commerce with foreign nations, and among the several states, and with the Indian tribes;

To establish an uniform rule of naturalization, and uniform laws on the subject of bankruptcies throughout the United States;

To coin money, regulate the value thereof, and of foreign coin, and fix the standard of weights and measures;

To provide for the punishment of counterfeiting the securities and current coin of the United States;

To establish post-offices and post-roads;

To promote the progress of science and useful arts, by securing for limited times, to authors and inventors, the exclusive right to their respective writings and discoveries;

To constitute tribunals inferior to the supreme court;

To define and punish piracies and felonies committed on the high seas, and offenses against the law of nations;

To declare war, grant letters of marque and reprisal, and make rules concerning captures on land and water;

To raise and support armies, but no appropriation of money to that use shall be for a longer term than two years;

To provide and maintain a navy;

To make rules for the government and regulation of the land and naval forces;

To provide for calling forth the militia to execute the laws of the union, suppress insurrections, and repel invasions;

To provide for organizing, arming, and disciplining the militia, and for governing such part of them as may be employed in the service of the United States, reserving to the states respectively the appointment of the officers, and the authority of training the militia according to the discipline prescribed by congress;

To exercise exclusive legislation in all cases whatsoever over such district (not exceeding ten miles square) as may, by cession of particular states, and the acceptance of congress, become the seat of the government of the United States, and to exercise like authority over all places purchased by the consent of the legislature of the state in which the same shall be, for the erection of forts, magazines, arsenals, dock-yards, and other needful buildings; and

To make all laws which shall be necessary and proper for carrying into execution the foregoing powers, and all other powers vested by this constitution in the government of the United States, or in any department or officer thereof.

Sec. 9. The migration or importation of such persons as any of the states now existing shall think proper to admit shall not be prohibited by the congress prior to the year one thousand eight hundred and eight; but a tax or duty may be imposed on such importation, not exceeding ten dollars for each person.

The privilege of the writ of *habeas corpus* shall not be suspended, unless when in cases of rebellion or invasion the public safety may require it.

No bill of attainder or *ex post facto* law shall be passed.

No capitation or other direct tax shall be laid, unless in proportion to the census or enumeration hereinbefore directed to be taken.

No tax or duty shall be laid on articles exported from any state.

No preference shall be given by any regulation of commerce or revenue to the ports of one state over those of another; nor shall vessels bound to or from one state be obliged to enter, clear, or pay duties in another.

No money shall be drawn from the treasury but in consequence of appropriations made by law; and a regular statement and account of the receipts and expenditures of all public money shall be published from time to time.

No title of nobility shall be granted by the United States; and no person holding any office of profit or trust under them shall, without the consent of the congress, accept of any present, emolument, office, or title, of any kind whatever, from any king, prince, or foreign state.

Sec. 10. No state shall enter into any treaty, alliance, or confederation; grant letters of marque and reprisal; coin money; emit bills of credit; make anything but gold and silver coin a tender in payment of debts; pass any bill of attainder, *ex post facto* law, or law impairing the obligation of contracts, or grant any title of nobility.

No state shall, without the consent of the congress, lay any impost or duties on imports or exports, except what may be absolutely necessary for executing its inspection laws; and the net produce of all duties and imposts, laid by any state on imports or exports, shall be for the use of the treasury of the United States; and all such laws shall be subject to the revision and control of the congress.

No state shall, without the consent of congress, lay any duty of tonnage, keep troops, or ships of war in time of peace, enter into any agreement or compact with another state, or with a foreign power, or engage in war, unless actually invaded, or in such imminent danger as will not admit of delay.

ARTICLE II., Sec. 1. The executive power shall be vested in a president of the United States of America. He shall hold his office during the term of four years, and, together with the vice-president, chosen for the same term, be elected as follows:

Each state shall appoint, in such manner as the legislature thereof may direct, a number of electors, equal to the whole number of senators and representatives to which the state may be entitled in the congress; but no senator or representative, or persons holding an office of trust or profit under the United States, shall be appointed an elector.*

The congress may determine the time of choosing the electors, and the day on which they shall give their votes; which day shall be the same throughout the United States.

No person, except a natural-born citizen, or a citizen of the United States at the time of the adoption of this constitution, shall be eligible to the office of president; neither shall any person be eligible to that office who shall not have attained to the age of 35 years, and been 14 years resident within the United States.

In case of the removal of the president from office, or of his death, resignation, or inability to discharge the powers and duties of the said office, the same shall devolve on the vice-president, and the congress may by law provide for the case of removal, death, resignation, or inability, both of the president and vice-president, declaring what officer shall then act as president, and such officer shall act accordingly, until the disability be removed, or a president shall be elected.

The president shall, at stated times, receive for his services a compensation, which shall neither be increased nor diminished during the period for which he shall have been elected, and he shall not receive within that period any other emolument from the United States, or any of them.

Before he enter on the execution of his office, he shall take the following oath or affirmation: "I do solemnly swear (or affirm) that I will faithfully execute the office of president of the United States, and will, to the best of my ability, preserve, protect, and defend the constitution of the United States."

Sec. 2. The president shall be commander-in-chief of the army and navy of the United States, and of the militia of the several states, when called into the actual service of the United States; he may require the opinion, in writing, of the principal officer in each of the executive departments upon any subject relating to the duties of their respective offices, and he shall have power to grant reprieves and pardons for offenses against the United States, except in cases of impeachment.

He shall have power, by and with the advice and consent of the senate, to make treaties, provided two thirds of the senators present concur; and he shall nominate, and by and with the advice and consent of the senate, shall appoint ambassadors, other public ministers and consuls, judges of the supreme court, and all other officers of the United States, whose appointments are not herein otherwise provided for, and which shall be established by law; but the congress may by law vest the appointment of such inferior officers as they think proper in the president alone, in the courts of law, or in the heads of departments.

The president shall have power to fill up all vacancies that may happen during the recess of the senate, by granting commissions which shall expire at the end of their next session.

Sec. 3. He shall from time to time give to the congress information of the state of the union, and recommend to their consideration such measures as he shall judge necessary and expedient; he may on extraordinary occasions convene both houses, or either of them, and in case of disagreement between them, with respect to the time of adjournment, he may adjourn them to such time as he shall think proper; he shall receive ambassadors and other public ministers; he shall take care that the laws be faithfully executed, and shall commission all the officers of the United States.

* This mode of election of president and vice-president has been modified by the twelfth amendment, *post*.

Sec. 4. The president, vice-president, and all civil officers of the United States, shall be removed from office on impeachment for, and conviction of, treason, bribery, or other high crimes and misdemeanors.

ARTICLE III., Sec. 1. The judicial power of the United States shall be vested in one supreme court, and in such inferior courts as the congress may from time to time ordain and establish. The judges, both of the supreme and inferior courts, shall hold their offices during good behavior, and shall, at stated times, receive for their services a compensation, which shall not be diminished during their continuance in office.

Sec. 2. The judicial power shall extend to all cases, in law and equity, arising under this constitution, the laws of the United States, and treaties made, or which shall be made, under their authority; to all cases affecting ambassadors, other public ministers, and consuls; to all cases of admiralty and maritime jurisdiction; to controversies to which the United States shall be a party; to controversies between two or more states; between a state and citizens of another state; between citizens of different states; between citizens of the same state claiming lands under grants of different states, and between a state, or the citizens thereof, and foreign states, citizens, or subjects.

In all cases affecting ambassadors, other public ministers, and consuls, and those in which a state shall be party, the supreme court shall have original jurisdiction. In all the other cases before mentioned, the supreme court shall have appellate jurisdiction, both as to law and fact, with such exceptions and under such regulations as the congress shall make.

The trial of all crimes, except in cases of impeachment, shall be by jury; and such trial shall be held in the state where the said crimes shall have been committed; but when not committed within any state, the trial shall be at such place or places as the congress may by law have directed.

Sec. 3. Treason against the United States shall consist only in levying war against them, or in adhering to their enemies, giving them aid and comfort.

No person shall be convicted of treason unless on the testimony of two witnesses to the same overt act, or on confession in open court.

The congress shall have power to declare the punishment of treason; but no attainder of treason shall work corruption of blood, or forfeiture except during the life of the person attainted.

ARTICLE IV., SEC. 1. Full faith and credit shall be given in each state to the public acts, records, and judicial proceedings of every other state. And the congress may by general laws prescribe the manner in which such acts, records, and proceedings shall be proved, and the effect thereof.

SEC. 2. The citizens of each state shall be entitled to all privileges and immunities of citizens in the several states.

A person charged in any state with treason, felony, or other crime, who shall flee from justice, and be found in another state, shall, on demand of the executive authority of the state from which he fled, be delivered up, to be removed to the state having jurisdiction of the crime.

No person held to service or labor in one state, under the laws thereof, escaping into another, shall, in consequence of any law or regulation therein, be discharged from such service or labor, but shall be delivered up on claim of the party to whom such service or labor may be due.

SEC. 3. New states may be admitted by the congress into this union; but no new state shall be formed or erected within the jurisdiction of any other state; nor any state be formed by the junction of two or more states, or parts of states, without the consent of the legislatures of the states concerned as well as of the congress.

The congress shall have power to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States; and nothing in this constitution shall be so construed as to prejudice any claims of the United States, or of any particular state.

Sec. 4. The United States shall guarantee to every state in this union a republican form of government, and shall protect each of them against invasion, and, on application of the legislature, or of the executive (when the legislature cannot be convened), against domestic violence.

ARTICLE V. The congress, whenever two thirds of both houses shall deem it necessary, shall propose amendments to this constitution, or, on the application of the legislatures of two thirds of the several states, shall call a convention for proposing amendments, which, in either case, shall be valid to all intents and purposes as part of this constitution, when ratified by the legislatures of three fourths of the several states, or by conventions in three fourths thereof, as the one or the other mode of ratification may be proposed by the congress; provided, that no amendment which may be made prior to the year one thousand eight hundred and eight shall in any manner affect the first and fourth clauses in the ninth section of the first article; and that no state, without its consent, shall be deprived of its equal suffrage in the senate.

ARTICLE VI. All debts contracted and engagements entered into before the adoption of this constitution shall be as valid against the United States under this constitution, as under the confederation.

This constitution and the laws of the United States which shall be made in pursuance

thereof, and all treaties made, or which shall be made, under the authority of the United States, shall be the supreme law of the land; and the judges in every state shall be bound thereby, anything in the constitution or laws of any state to the contrary notwithstanding.

The senators and representatives before mentioned, and the members of the several state legislatures, and all executive and judicial officers, both of the United States and of the several states, shall be bound by oath or affirmation to support this constitution; but no religious test shall ever be required as a qualification to any office or public trust under the United States.

ARTICLE VII. The ratification of the conventions of nine states shall be sufficient for the establishment of this constitution between the states so ratifying the same.

Done in convention, by the unanimous consent of the states present, the 17th day of Sept., in the year of our Lord one thousand seven hundred and eighty-seven, and of the independence of the United States of America the twelfth.

AMENDMENTS.*

ARTICLE I. Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech or of the press; or the right of the people peaceably to assemble, and to petition the government for redress of grievances.

ARTICLE II. A well-regulated militia being necessary to the security of a free state, the right of the people to keep and bear arms shall not be infringed.

ARTICLE III. No soldier shall, in time of peace, be quartered in any house without the consent of the owner, nor in time of war but in a manner to be prescribed by law.

ARTICLE IV. The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated; and no warrants shall issue but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

ARTICLE V. No person shall be held to answer for a capital or otherwise infamous crime, unless on a presentment or indictment of a grand jury, except in cases arising in the land or naval forces, or in the militia, when in actual service, in time of war and public danger; nor shall any person be subject for the same offense to be twice put in jeopardy of life or limb, nor shall be compelled in any criminal case to be a witness against himself; nor to be deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use without just compensation.

ARTICLE VI. In all criminal prosecutions, the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the state and district wherein the crime shall have been committed, which district shall have been previously ascertained by law, and to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him; to have compulsory process for obtaining witnesses in his favor, and to have the assistance of counsel for his defense.

ARTICLE VII. In suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury shall be otherwise re-examined in any court of the United States than according to the rules of the common law.

ARTICLE VIII. Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishment inflicted.

ARTICLE IX. The enumeration in the constitution of certain rights shall not be construed to deny or disparage others retained by the people.

ARTICLE X. The powers not delegated to the United States by the constitution, nor prohibited by it to the states, are reserved to the states respectively, or to the people.

ARTICLE XI. The judicial power of the United States shall not be construed to extend to any suit in law or equity commenced or prosecuted against one of the United States by citizens of another state, or by citizens or subjects of any foreign state.

ARTICLE XII. The electors shall meet in their respective states, and vote by ballot for president and vice-president, one of whom at least shall not be an inhabitant of the same state with themselves. They shall name in their ballots the person voted for as president, and in distinct ballots the person voted for as vice-president; and they shall make distinct lists of all persons voted for as president, and of all persons voted for as vice-president, and of the number of votes for each, which lists they shall sign and certify, and transmit, sealed, to the seat of the government of the United States, directed to the president of the senate. The president of the senate shall, in the presence of the senate and house of representatives, open all the certificates, and the votes shall then be counted; the person having the greatest number of votes for president shall be the president, if such number be a majority of the whole number of electors appointed; and if no person have such majority, then from the persons having the highest numbers, not exceeding three, on the list of those voted for as president, the house of representatives shall choose immediately, by ballot, the president. But in choosing the president, the votes shall be taken by states, the representation from each state having one vote; a quorum for this purpose shall consist of a member or members from two

* Articles I. to X., inclusive, were proposed by the first congress in 1789-90. Article XI. in 1793, Article XII. in 1803, Article XIII. in 1865, Article XIV. in 1868, and Article XV. in 1870.

thirds of the states, and a majority of all the states shall be necessary to a choice. And if the house of representatives shall not choose a president, whenever the right of choice shall devolve upon them, before the fourth day of March next following, then the vice-president shall act as president, as in the case of the death or other constitutional disability of the president. The person having the greatest number of votes as vice-president shall be the vice-president, if such number be a majority of the whole number of electors appointed; and if no person have a majority, then from the two highest numbers on the list the senate shall choose the vice-president; a quorum for the purpose shall consist of two thirds of the whole number of senators, and a majority of the whole number shall be necessary to a choice. But no person constitutionally ineligible to the office of president shall be eligible to that of vice-president of the United States.

ARTICLE XIII., Sec. 1. Neither slavery nor involuntary servitude, except as a punishment for crime whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction.

Sec. 2. Congress shall have power to enforce this article by appropriate legislation.

ARTICLE XIV., Sec. 1. All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States, and of the state wherein they reside. No state shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any state deprive any person of life, liberty, or property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws.

Sec. 2. Representatives shall be apportioned among the several states according to their respective numbers, counting the whole number of persons in each state, excluding Indians not taxed. But when the right to vote at any election for the choice of electors for president and vice-president of the United States, representatives in congress, the executive and judical officers of a state, or the members of the legistature thereof, is denied to any of the male inhabitants of such state being twenty-one years of age, and citizens of the United States, or in any way abridged, except for participation in rebellion or other crime, the basis of representation therein shall be reduced in the proportion which the number of such male citizens shall bear to the whole number of male citizens twenty-one years of age in such state.

Sec. 3. No person shall be a senator or representative in congress, or elector of president and vice-president, or hold any office, civil or military, under the United States, or under any state, who, having previously taken an oath as a member of congress, or as an officer of the United States, or as a member of any state legislature, or as an executive or judicial officer of any state, to support the constitution of the United States, shall have engaged in insurrection or rebellion against the same, or given aid or comfort to the enemies thereof. But congress may, by a vote of two thirds of each house, remove such disability.

Sec. 4. The validity of the public debt of the United States authorized by law, including debts incurred for payment of pensions and bounties for services in suppressing insurrection or rebellion, shall not be questioned. But neither the United States nor any state shall assume or pay any debt or obligation incurred in aid of insurrection or rebellion against the United States, or any claim for the loss or emancipation of any slave; but all such debts, obligations, and claims shall be held illegal and void.

Sec. 5. The congress shall have power to enforce, by appropriate legislation, the provisions of this article.

ARTICLE XV., Sec. 1. The right of the citizens of the United States to vote shall not be denied or abridged by the United States, or by any state, on account of race, color, or previous condition of servitude.

Sec. 2. The congress shall have power to enforce this article by appropriate legislation.

The state constitutions are very much alike in their general provisions. Of late years, and especially since the rebellion, many of the states have amended and modernized their constitutions; but in all cases the state constitution must agree with the federal constitution; any provision conflicting with that is void. There is at this time an interesting question pending in regard to California. In 1879, that state adopted amendments to her constitution, which prohibits the introduction of Chinese into the state as citizens. It is alleged that this provision conflicts with the treaty between the United States and China, and is therefore void, inasmuch as (see UNITED STATES CONSTITUTION) "all treaties made, or which shall be made, under the authority of the United States shall be the supreme law of the land."

CONSTITUTIONAL CONVENTION, a gathering of delegates chosen by the people of a state to prepare amendments to an existing or propose a new constitution. The constitutional convention by which the constitution of the United States was prepared was made up of delegates from the several states, and met in Philadelphia in May, 1787, choosing George Washington as their presiding officer. There can be no other such constitutional convention, since the constitution provides that amendments shall be proposed in congress and submitted to the states for adoption. In the states, delegates to constitutional convention are usually elected by the people. Their work is submitted to the legislature, and (in most states) by the legislature to a direct vote of

the people. Among the first of the original states to organize under a constitution was New York, whose first constitutional convention was held in the spring of 1777. Since that time the constitution has been twice radically amended by constitutional conventions in 1821 and in 1846. Rhode Island was the last of the original states to adopt a constitution, which was in 1842. Up to that year she was ruled under the royal charter of 1662. The proceedings of a constitutional convention are usually governed by the rules of state legislative bodies.

CONSTITUTION OF MATTER. The ATOMIC constitution of bodies is discussed when we consider whether they consist of finite ultimate particles called *atoms*, or are infinitely divisible. The CHEMICAL constitution of bodies is the mode in which elementary substances unite to form compounds. The PHYSICAL constitution of bodies is the mode in which particles of matter in forms cognizable by sense, are aggregated to form masses of known qualities. Bodies are classed according to their ability to retain their dimensions when they are subjected to internal stress. A *solid* retains its dimensions even under the influence of a stress which acts in but a single direction. A *fluid* changes its dimensions unless the stress acting within it is uniform in all directions. If the fluid is capable of expanding indefinitely to fill the vessel which contains it, it is a *gas;* if, under ordinary circumstances, the fluid does not so expand, but remains collected in some part of the vessel, it is a *liquid*. The lines of demarkation between these states of matter cannot be sharply drawn; the conditions merge insensibly, the one into the other. Lead is classed as a solid, yet if submitted to suitable pressure, its particles move upon each other, and the given mass takes a new form, as when bullets are made by the cold process from rods of lead. Sulphuric ether is usually a liquid, which, under ordinary conditions, occupies part of a vessel without expanding to fill the whole; but if pressure be removed, as in the receiver of an air-pump, the ether assumes the gaseous form, and resumes the form of a liquid when pressure is restored. Under suitable variations of volume and pressure, part of the liquid may be vaporized, or part of the vapor may be liquefied. Experiments indicate that all liquids may be vaporized, as it is known that all gases and vapors may be liquefied. Substances pass from a liquid to a solid state, or *vice versâ*, with different degrees of abruptness. The change occurs suddenly in most metals, as gold, copper, lead, while iron and glass melt by degrees, and harden slowly; whence it comes that iron and glass can be welded, while gold, copper, etc., cannot. When the particles of water, iron, sulphur, etc., solidify, they arrange themselves according to some law of symmetry, forming crystals; other substances, as pitch, becoming constantly more and more viscous, solidify by imperceptible degrees, and without symmetrical or crystalline arrangement of particles. This quality of viscosity indicates a certain attraction between the particles of a fluid, by which they have some power of resisting the stress to which they ultimately yield. In this respect a series of substances may be arranged, beginning with fluids of extreme limpidity, as water, alcohol, ether, passing through certain oils, molasses, tar, molten glass, that may be drawn out into strings, to the metals which even when cold may be drawn into wire, or rolled into sheets. Prof. Forbes explains the motion of the glacier by the viscosity of ice. A substance may seem to lack this property when struck sharply, and may yet show it under constant, though moderate, pressure; thus pitch, when cold, breaks under the hammer, and slowly bends to fit the surface on which it rests.

A body is said to be *elastic*, if, after its dimensions have changed under the influence of a stress, it resumes its original dimensions when the stress is removed. The numerical ratio of stress to strain, or deformation, is called the *co-efficient of elasticity;* that of strain to stress, the *co-efficient of pliability*. Thus, if 10,000 lbs., applied to a wire of assumed unit of cross section, elongate the wire one per cent, the co efficient of elasticity of the wire is $1 \frac{000}{01} = 1,000,000$ lbs. per unit of section. If the stress upon an elastic body be pushed beyond certain limits, different for different substances, the body does not return to its former dimensions, but remains permanently deformed, or may be parted. The limit beyond which the body becomes permanently deformed is the *limit of elasticity*. The limit beyond which it breaks is called the *limit of tenacity*. The body is *soft*, if it may be deformed under a small force; it is *tough* if a large force is required. If rupture occurs before deformation, the body is *brittle;* if it resists great force with neither rupture nor deformation, it is *hard*. The *stiffness* of a body is the measure of its ability to resist deformation; its *strength*, the measure of the force required to break it.

The changes which occur in molecular deformation have been explained thus: We know that the molecules of all bodies are in motion. In fluids the motion is such that any molecule may pass freely from one part of the mass to another; in solids we may suppose that some, at least, of the particles merely oscillate about a certain position so that the configuration of a group of molecules is never much changed from a certain stable form about which they oscillate. If the amplitude of the oscillation exceeds a certain limit, the molecules, failing to return to their old relations, assume new figures of stability, in which the strains are less than in the former figures, and may be zero. This breaking up of configuration may result from wide amplitude of vibration, or from great strain, and we may suppose that the different groups of a mass may have different powers of resistance in either of these respects. We may further suppose that as the groups break up, some of the resulting configurations are such as correspond to a

strain which is uniform in all directions. In the ratio in which the groups reach this result, the mass approaches the condition of a fluid of greater or less viscosity. If the mass be conceived as made up of molecules which differ in stability of configuration, it is possible that the weaker have yielded to a force which the stronger have been able to resist, and that the latter retain their original condition; that, subsequently, other forces, as change of temperature or of moisture, or violent vibration, may cause a farther disintegration of the groups of low stability; that then the more stable groups have opportunity to control these weaker groups, and gradually restore the whole mass to the condition and form which it had before any deformation occurred.

CON'SUBSTANTIA'TION. See TRANSUBSTANTIATION.

CONSUETU'DINARY LAW, is that law which derives its binding character, not from the expressed, but from the tacit consent of the general will of the community. As it is generally transmitted from age to age by oral tradition and universal custom, and is rarely embodied in any positive enactment, C. L. is often spoken of as unwritten law (*lex non scripta*). The customary laws of Normandy, Brittany, and some other provinces of France, however, were reduced to writing; and with us much of the common law, both of England and Scotland, now rests on statute, as well as on custom and usage. Even in modern practice, usage is often resorted to as the best interpreter of law. Of this a familiar example is the important part assigned to mercantile usage in construing the law-merchant. In this case, the custom must generally be established by evidence, in place of being taken for granted, as are the laws of primogeniture, legitim, terse, courtesy, and the like. The effect of custom in repealing statutes will be considered under DESUETUDE. See also COMMON LAW.

CONSUL, the title of the two highest ordinary magistrates in the Roman republic. The etymology of the word cannot be precisely determined; thus much, however, seems clear, that it implies that there were more than one—that there were colleagues. The idea of two supreme magistrates, or joint-presidents of the state, seems to have been interwoven with the earliest conceptions of political organization in Rome. According to tradition, there were at first two kings; and the constitution of Servius is said to have provided for the sovereign power being again divided between two functionaries. But it was not till after the expulsion of Tarquin that Lucius Junius Brutus and Lucius Tarquinius Collatinus were chosen joint-heads of the state. These chief-magistrates seem to have been at first called *prætores* (leaders, i.e., of the armies), and the title of *consules* to have been introduced about 300 B.C. At first, the consuls seem to have differed from the kings in little else than their limited tenure of office, and the power which their fellow-citizens retained of calling them to account at its termination. They never assumed the golden crown, but their dress in almost every other respect was regal, and they had ivory scepters surmounted by eagles. In public assemblies, they occupied a sort of throne (*sella curulis*), and in the senate they presided and sat on elevated seats. They made peace, and negotiated foreign alliances, had the supreme command of the army, and appointed the public treasurers. They likewise exercised the judicial functions of royalty. In their capacity of supreme judges they continued to be known as *prætores*, until ultimately separate magistrates with that title were appointed. The symbol of their authority was the bundle of rods (*fasces*), with the axe in the center, which was carried before them by twelve lictors. For a considerable period, the consuls were chosen exclusively from the *populus* or patricians, as opposed to the *plebs;* and during the long struggle between the patricians and plebeians, they sided invariably with their own order. At length, however, two plebeian officers, called *tribuni plebis*, were appointed as a sort of democratic rivals to the aristocratic consuls. To them was assigned the duty of presiding in the assemblies of the plebeians, as the consuls did in the other assemblies; and though they could not dictate, they were entitled by their *veto* to arrest measures proceeding on consular or senatorial authority. The result of this rivalry was, that the consulship was opened to plebeians; and from 172 B.C. down to the period of the empire, the consuls were frequently plebeians. In accordance with the ordinary course of political development, the organization of the Roman state became more complicated, in proportion as it became impossible for the C. to discharge in person the various duties which in the beginning always center in the possessors of supreme power. In 442 B.C., censors (q.v.) were appointed. In 365, prætors had the chief judicial functions of the consuls assigned to them. In the government of the provinces, the aid of the former consuls was called in, the C. thus appointed having the title of *pro-consul*. In sudden and critical emergencies, the consuls were either superseded by a dictator (q.v.), or absolute power for the occasion was conferred on them by the decree of the senate, which ran in the famous formula: *Videant consules ne quid respublica detrimenti capiat*—"Let the consuls look to it, that the state take no harm." The oath which the consuls took on entering office they were obliged to repeat as a declaration, not of intention but of fact, on quitting it at the end of the year. The consuls were inaugurated by a great procession to the capitol and a sacrifice to Jupiter Capitolinus. The shadow of the consulate survived the downfall of liberty; but the

election of the consuls was taken from the people and conferred on the senate. Then their number was increased; they were divided into classes—*C. ordinarii, suffecti, honorarii,* etc.—till at last the office became a mere honorary appointment conferred by the emperor.

The title of C. was revived in the French republic. See CONSULATE.

CONSUL (*ante*). The consuls of the United States are appointed by the president and senate, and each one gives a bond of $2,000 to $10,000 for the faithful performance of his official duties. Among their powers and duties, they have authority to receive protests or declarations which captains, masters, crews, passengers, merchants, and others make regarding American commerce; they are required to administer on the estate of an American citizen dying within their consular jurisdiction and leaving no legal representative, when the laws of the country permit; to take charge of and secure the effects of stranded American vessels in the absence of a master, owner, or consignee; to settle disputes between officers of vessels and their crews; to provide for destitute seamen, and send them to the United States at public expense, etc. They have also various powers and duties in matters of commerce and trade. In some cases they have stated salaries, but the greater portion are paid by fees. They generally have special privileges under local law or usage; but in civil and criminal cases they are on the same footing with non-official foreign residents owing temporary allegiance to the state.

CONSUL, MERCANTILE, the name given to those officers whom the state maintains in foreign countries for the protection of its trade, and vindication of the rights of its merchants, and to whom the further duty is assigned of keeping the home government informed of all facts bearing on the commercial interests of the country. The practice of appointing such officers originated among the trading communities of Italy about the middle of the 12th c., and gradually extended itself; and in the 16th c., had been adopted by all the countries of Europe. In addition to their commercial duties, others of a more strictly political kind were frequently confided to consuls in places in which there was no ambassador or political agent. In almost all the countries of Europe, consuls are divided into consuls-general, consuls, vice-consuls, and consular agents. The C.'s first duty on his arrival, is to exhibit his commission to the authorities of the country to which he is accredited, in order that he may obtain their sanction to his appointment. This sanction is communicated to him in a document called an *exequatur*, which secures to him the enjoyment of such "privileges, immunities, and exemptions as have been enjoyed by his predecessors, and as are usually granted to consuls in the country in which he is to reside." The general duties of English consuls are communicated to them in printed instructions. In these the C. is ordered to make himself conversant with the laws and general principles which relate to the trade of Great Britain with foreign parts, and with the language and municipal laws of the country wherein he resides. Further, it is his duty to protect his countrymen in the lawful exercise of their trade, to quiet their differences, to obtain the redress of injuries done them—failing which, to report the matter to the English ambassador at the court of that nation—and to forward to the secretary of state for foreign affairs an annual return of the trade carried on at the different ports within his consulate, as well as a quarterly account of the market prices of agricultural produce during each week of the quarter, the course of exchange, etc. The C. must afford relief to British seamen or other subjects wrecked on the coast, and endeavor to procure them the means of returning to England. The commanders of queen's ships touching on the coast are entitled to call on him for intelligence, and aid in procuring supplies of water, provisions, and the like; and it is his duty to endeavor to recover all wrecks and stores, etc., of queen's ships, whether found at sea and brought into the port at which he resides, or thrown on the coast. As regards the "privileges and immunities" of a C., it is doubtful whether he is in any case exempt from the civil jurisdiction of the state to which he is accredited; and in the case of a trading C., it is at any rate plain that he is not. But a C. sent out from this country, and not engaging in trade, has always been exempted from the taxes of the country in which he resides. He is generally permitted to call in a guard when he requires it for his own safety, or the preservation of discipline; and in countries not inhabited by a European population, he has all the privileges of an ambassador. A C. can perform all the acts of a notary-public; all deeds executed by him being acknowledged as valid by our courts of law. The fiction is, that the consulate is the territory of the country from which the C. is sent, and, consequently, that deeds and acts done within it, or under the C.'s seal, are done in England. Hence the marriage of British subjects recorded in the books of a British C. is a valid ceremony.

In some cases, British consuls are allowed to trade; in others, they are prohibited from so doing. The salary of consuls-general varies from £300 to £2,000, the average being about £1000; the salary of a consul varies from £100 to £1500, and of a vice-consul, from £50 to £800. A select committee of the house of commons reported in 1872, that the consular service was still too varied in character and arrangements to be the subject of such organization and classification as other branches of the civil service, but in event of such regulation and revision of the posts as was then recommended, suggested that it would be desirable to introduce changes in that direction. Though of opinion

that some posts were underpaid, tne committee was opposed to an indiscriminate raising of salaries.

CONSULATE (Lat. *consulatus*, consulship), (in France). This supreme magistracy of the French republic was established after the revolution of the 18th Brumaire (q.v.), and lasted to the coronation of Napoleon. On the sudden overthrow of the directory with the constitution of the year III., the members of the council of the ancients and the five hundred, or rather those of them who approved of, or submitted to, that act of violence on the part of Bonaparte's grenadiers, appointed three consuls—Sièyes, Bonaparte, and Roger Ducos. This approach to a monarchical government was confirmed, Dec. 13, 1799, by the constitution of the year VIII., by which Bonaparte was made first consul, with Cambacérès and Lebrun as second and third; each was elected for 10 years, and was re-eligible. The powers of the first consul were made almost absolute. He promulgated the laws, appointed or dismissed ministers, ambassadors, members of the council of state, military and naval officers, and all civil and criminal judges, except justices of peace and members of the court of cassation. His income was fixed at 500,000 francs, and that of his inferior colleagues at 150,000 francs each. Bonaparte took up his residence at the Tuileries, and held a splendid court. By resolutions of the senate, in May, 1802, Bonaparte was re-elected for 10 additional years, and in Aug. of the same year was made first consul for life. In the appeal made to the nation, out of 3,577,259 votes, 3,568,885 were in favor of Bonaparte. The adulation of the senate and people now knew no limit. Nothing but the imperial name and insignia were wanting to complete the picture of absolutism, and these were supplied, May 18, 1804, when Napoleon was made emperor.

CON'SULATE OF THE SEA, a collection of maritime customs and ordinances in the Catalan language, published at Barcelona in the latter part of the 15th century. It contains a code of procedure issued by the kings of Aragon for the guidance of the courts of the consul of the sea, a collection of ancient customs of the sea, and a body of ordinances for the government of cruisers of war. The most valuable portion, *The Customs of the Sea*, has been printed in English in the appendix to the *Black Book of the Admiralty*, London, 1874.

CONSUMPTION, in medical language, phthisis, tabes, marasmus (q.v.), and more particularly phthisis pulmonalis or pulmonary C., is a disease of great frequency and severity, which, in the civilized nations of Europe, produces from one sixth to one tenth of the total mortality in ordinary times. It is uncertain whether there is any part of the world, or any race of men, exempt from C.; this exemption having been at different times claimed for the inhabitants both of hot and cold climates, as for India, Australia, Canada, Iceland, etc., but in most instances in consequence of imperfect knowledge of the facts. On the whole, C. appears to be one of those diseases that have a tendency to increase, unless great care be taken to remove conditions unfavorable to the public health, with the increased aggregation of the human family, and with that extended intercourse which is one of the consequences of an advanced civilization. Hence it is most frequent and most fatal in towns, and most of all in those that are near the great centers of intercourse; while in remote mountain districts, in islands cut off by a wide ocean from the general stream of human communication, it is commonly stated to be, and probably is, comparatively rare. As a rule, however, the presence of this dreadful scourge has almost invariably been discovered to a greater or less extent, wherever the causes of mortality have been carefully examined under enlightened medical superintendence; and we are still very far from having acquired such an insight into its laws of diffusion, as to be able to deduce from them any exact doctrine as to its causation. C. affects peculiarly the young, especially those in the first period of adult life; though it is nearly certain that the seeds of the disease are commonly sown in the constitution in youth, and even in infancy. Its relation to sex is variable, being apparently determined in part by the predominating occupations, and the habits of living, of the population. It is often observed to be plainly inherited from one or other parent, most frequently the mother; and it is one of the diseases which has been stated to be frequently developed as a consequence of the marriage of cousins or other near relatives, especially when the parental stock is itself tainted or not free from suspicion. In life-insurance, all these circumstances are usually carefully weighed by the medical officers of companies, as the grounds for admission or rejection of a candidate for insurance; and nothing is more certain to cause rejection, than a well-grounded suspicion of a consumptive tendency, either personal or derived from the parents, or shown in brothers and sisters. It is therefore a fair subject for consideration, on grounds of ordinary prudence, as well as on those of moral and religious obligation, whether those afflicted with this malady, or strongly predisposed to it, ought to enter into the married state, and to incur the probable afflictions and responsibilities connected with the maintenance of an unhealthy family. It has even been proposed to legislate on this subject; but sober-minded political economists will probably always consider that it is in vain to constrain by laws the strongest instincts of humanity, especially when the application of the law must depend upon such refined distinctions as in the present instance. The subject is clearly one for an appeal to the reason and conscience of individuals, rather than for an attempt to lay down theoretical rules of conduct; but those who would guide their lives by principle,

and who would not rush into marriage from the inferior motives alone, would do well to take it into serious consideration.

Among the determining causes of C. in large populations, the best ascertained are those connected with overcrowding and bad ventilation, especially when connected with all the depressing influences inherent in poverty, or associated with a reckless and abandoned life. It is certain that much might be done to improve the public health in this respect, by more attention on the part of the employers of labor to the comfort and habits of those who are, in more senses than one, their "hands," and the sources of their prosperity. A certain amount of improvement has, indeed, already been effected by the improved living of the working-classes during the last twenty years. Still it is well known, and proved by careful inquiries, that the workshops of tailors, printers, bakers, and other businesses carried on in close, ill-ventilated apartments, by large numbers of workmen, are, in a very aggravated sense, nurseries of consumption. Cotton and linen factories have also been shown, when ill regulated, to be largely responsible for the death of their inmates from this disease. The finest regiments in the army were proved, some years ago, by evidence before a royal commission, to be decimated by this disease in time of peace to a frightful extent, in consequence, probably, of the bad ventilation and deficient comforts of the barracks. The cutlers and needle-grinders of Sheffield appear to owe their notoriously short lives to C., brought on by the inhalation of metallic particles in the close and stifling atmosphere of their workshops. The stone-hewers of Edinburgh and Glasgow, and the colliers of the Lothians, were some years ago in a similar predicament, from the inhalation, in the one case of stone-dust, in the other of lamp-smoke not sufficiently diluted with air. And even agricultural laborers, in many parts of the country, suffer from C. to an extent that is quite appalling, owing to the discomforts, and particularly the close and overcrowded condition of their dwellings. It is lamentable to think that such evils as these exist, and that they might be to a great extent avoided; but this conclusion appears to follow legitimately from the evidence that has been adduced of the intimate connection of C. with overcrowding and a diminished supply of fresh air in workshops and dwellings. Some years ago, Dr. Guy published the details of an inquiry into the health of the journeymen printers of London, from which it appeared, in the clearest manner, that the liability of these workmen to spitting of blood, and other well-known symptoms of C., was in exact proportion to the degree to which they had been subject to the evil influences of ill-ventilated workshops; and the marked improvement in the health of our prisons in the present day, has likewise been shown to be to a considerable extent due to the diminished prevalence of C. among the inmates; which, again, is attributed, on good evidence, to the improved construction of the cells, and the increased facilities for wholesome exercise and occupation given to prisoners under confinement for lengthened periods. It has even been plausibly maintained, that in some of our modern jails C. is less prevalent than it is among the general population of the classes from which prisoners are chiefly taken; so that the fact of confinement, and the depressing influences of a penal discipline, are more than counterbalanced by the effect of a regular life, wholesome but plain food, and a sufficient amount of occupation to maintain mind and body in a sound state. Even admitting, therefore, that the causes of C. may be in part practically irremovable, there seems no reason to doubt that very much might be done to diminish its prevalence, as well as to arrest its course when already formed, by due attention to the comfort of the laboring population, both in their dwellings and in the pursuit of their daily occupations.

The general symptoms of C are patent to every eye; the more accurate appreciation of them, however, and the use of the more strictly medical means for detecting the disease, and judging of its progress and probable issue, are among the more difficult of the duties of the physician. The disease often escapes attention in its early stages; yet not so much from the absolute difficulty of its detection, as from the insidiousness of its invasion, and the small alarm which its early symptoms excite in the mind of the sufferer, and even of his friends, when much occupied with the business of life, or when naturally not gifted with the faculty of refined observation. Whenever a young person appears to lose flesh and strength without known cause, when the color changes much from day to day, and from hour to hour; when shiverings are complained of, or even a sense of too great chilliness, alternated by flushings and an oppressive warmth, or too copious perspiration; when with these symptoms there is cough, however slight, or pains between the shoulders and about the shoulder-blades, or below the collar-bones; when there is an occasional tendency to spit up small quantities of blood from the chest, or when the patient is subject to repeated attacks of catarrh (q.v.), or when the bowels are habitually loose or very irregular, or when with any one of these symptoms in the female there is diminution or suppression of the usual periodic discharges, it is not too soon to apprehend the occurrence of C., and to place the patient under medical advice. In some instances the alarm may appear groundless, and health may rapidly return under appropriate treatment; but a far greater danger is that these symptoms, being overlooked or neglected, may prove only the precursors of a more apparently serious attack of disease, and that the first suspicion of C. may arise only after irreparable mischief has taken place. In general terms, it may be said that during the period of adolescence—i.e., before the body has assumed its full development in regard

to strength and weight—no considerable check to its advance in these respects ought to pass unnoticed, more especially if attended with habitual feverishness, cough, or other symptoms of impaired health.

Attempts have been made to show, that a peculiar habit of body or physical conformation, apart from disordered health, is to be regarded as predisposing to C.; and this has been called the phthisical diathesis (q.v.), but little or no dependence can be placed on any such indications, for this disease unquestionably occurs with nearly equal frequency in all the physiological varieties of the human race, when exposed to its exciting and predisposing causes. The experienced eye of the physician, however, will often discover the lurking germs of this insidious malady, even when active symptoms have been long absent, or have recurred after a long period of comparatively good health, by the effect of former disease upon the development of the frame in the period of childhood. For a similar reason, the use of the stethoscope (q.v.), and other means of minutely examining into the state of the chest, will sometimes detect a wholly unexpected attack of pulmonary C. in persons who suppose their lungs to be quite sound, or who have forgotten that they were ever subject to disease. As a rule, however, the symptoms mentioned above are pretty safe guides as to the commencement of C., if care be taken that their gradual progress does not cause them to be overlooked. In a few cases the disease begins otherwise, the form being that of an acute attack, such as fever or inflammation of the chest; but such cases are of course at once detected, as being serious enough to require medical advice.

The further medical history of C. is very complicated, and can hardly be treated of with advantage in a work like the present. Generally speaking, the progress of the disease is marked by the following symptoms: progressive emaciation, with habitual fever and frequent sweating at night; cough and pains in the chest, with expectoration of mucus, and, in the end, of purulent matter in large quantities; diarrhœa (q.v.), and sometimes obstinate vomiting, oftener failure of the appetite, with occasional sickness; gradually increasing weakness and indisposition for active exertion, often with more or less difficulty of breathing on exertion, but rarely with extreme distress or pain of any kind. This remarkable freedom from acute suffering is probably one reason of the self-deception usually attributed to consumptive persons, by which they are led to believe in their curability up to a very advanced stage of the disorder.

The degree to which C. is curable has been a fruitful subject of discussion of late years. Properly speaking, there never has been any doubt that cases marked by all the symptoms of C. occasionally, and even pretty frequently in the early stages, get well; but it was argued that these were probably not genuine instances of what is now alone technically called C.—viz., tubercular disease. In France, where morbid anatomy was extensively cultivated in the beginning of the present century, the incurability of the tubercular form of C. was a general doctrine of the schools till the time of Laennec (q.v.), who, by multiplied instances, and careful observations on the dead body, showed beyond all question the occasional arrest even of advanced C., and the frequent cure of it in the early stages. The appearances in the lungs, and other organs of persons affected with C., will be discussed under TUBERCLE.

The treatment of C. is a very complicated subject, and one much misunderstood, partly owing to the misrepresentations of quacks, and partly from the great demand for palliative remedies on the part of patients and their friends, tending to obscure the true principles of treatment even to the mind of the physician. It is, however, now well ascertained that the greater part of the cure consists in hygienic measures—i.e., the regulation of the mode of living, the occupation, the diet, the clothing, the food, the hours of repose, etc., of the consumptive—and all treatment by drugs is usually regarded by well-informed physicians as subordinate to that just mentioned. A life in the open air to a considerable extent, and in a climate which admits of the enjoyment of such a life even in winter, is the best restorative in cases of incipient C.; yet too much may be sacrificed to the desire of obtaining these advantages, if a genial climate is sought at the expense of the comforts of an English home, or with the effect of producing anxiety of mind, or exhaustion of body by a long and fatiguing journey. Moreover, to many men a regular occupation is really a necessity in more senses than one; and to break up all the associations of habit in a person debilitated by disease, and not capable of seeking new sources of excitement, is to poison the springs of enjoyment, and render the remainder of life a burden. Many consumptives have been sent abroad only to die, and in all probability to die more miserably, and at an earlier period, than if they had remained at home. On the other hand, the favoring influences of climate are by no means to be rejected, when they can be obtained in accordance with the patient's previously formed habits, and with due regard to his means of occupation and prospects of eventual cure. A varied and wholesome, but light and unstimulating diet, including abundant dairy produce; flannel coverings next the skin, and clothing which is warm but not oppressive; a well-ventilated sleeping-apartment, with a moderate fire in cold weather; bathing in tepid water; the use of a respirator or of a light woolen covering for the mouth and nose in excessively cold weather; avoidance of late hours, crowded rooms, and every kind of dissipation; avoidance also of draughts of cold air, and of sitting in damp clothes or with damp feet; these are the principal circumstances to be kept in view in the ordinary regulation of the life of a consumptive patient. The

use of cod-liver oil has been very popular of late years in the treatment of C.; but it may be reasonably doubted whether the reputation of this remedy be due to its powers as a medicine or simply as a fattening food. Occasional small opiates, and other medicines to arrest irritating cough and subdue feverishness, and in special cases the treatment proper to the complications, such as diarrhœa (q.v.) and breathlessness, are generally admitted as useful adjuncts to the means above mentioned; but they can hardly be discussed in this place with advantage, and should be in general used only under medical advice. See Ancell on Tuberculosis—on Phthisis (translated for the Sydenham Society).

Consumption in the Lower Animals.—C. rarely occurs in horses, the health-depressing influences which produce it in man and other animals inducing in them glanders (q.v.) and farcy (q.v.). It is also rare among dogs, but is common in oxen and sheep, and still more so in pigs. It is one of the chief causes of death amongst the apes and other denizens of our zoological gardens. It is produced, as in man, by over-crowding, damp lodging, bad food, neglected colds, and the like debilitating causes. It is notoriously hereditary; is frequently developed by breeding from parents nearly related to each other, and mostly affects animals of faulty conformation, prevailing, for example, amongst cows with small thin necks, narrow carcasses, hollow flanks, and dirty unhealthy-looking skins. Such animals are, moreover, subject to dysentery; indeed, the two diseases depend, in cattle, on the same tuberculous or scrofulous state of system; they occur in the same stocks, and often replace each other in different generations. In all animals, the well-marked symptoms are very analogous. In cows, appetite and rumination become irregular; the coat stares, the skin is dry, and firmly adherent to the ribs; the animal is dull, loses flesh, is sometimes feverish, and if in milk, the secretion is diminished, blue, and poor; a tickling cough is easily excited; and diarrhea is readily set up, and once established, is arrested with difficulty. As the disease advances, the lymphatic glands about the neck and elsewhere are enlarged; the fever, cough, and debility increase; the pulse is weak and quick; the excretions are fetid; and purulent discharges trickle from the eyes and nostrils. C. in the lower animals is certainly curable, especially in the earlier stages. The treatment consists mainly in attention to regimen and diet, with careful protection from damp, cold, and other causes inimical to health. The food should be good, easily digested, and nourishing, and the capricious appetite coaxed by frequent variety. For cows, linseed or other convenient oleaginous articles should be freely used. Irregularity of the bowels may be remedied by an occasional dose of treacle, or by a small quantity of linseed or of castor oil; but active purgatives, and, indeed, all powerful and irritating drugs, must be avoided. A few simple tonics may sometimes be advisable. C. might be greatly limited by rejecting, for breeding purposes, all animals having any tuberculous taint, and by greater attention to the feeding, shelter, and warmth of young stock. Neglect of these latter precautions is the cause of its unusual prevalence amongst the young cattle of the more exposed parts of our eastern coast. Its connection with over-crowding and faulty sanitary arrangements, is evident from its frequent occurrence amongst the cows that have for several months been inmates of our badly managed town dairies.

CONSUMPTION, in political economy, is the converse of production (q.v.). The word is of very frequent use by political economists, but it has never had a definite meaning attached to it. It may be generally said, that everything which is produced or made by human labor is to be consumed, or to cease in its turn to exist. But there is not only a great difference in the rate at which things are consumed—some going rapidly, while others last for centuries—but there is a C. which is annihilation or loss, and a C. which is in reality gain, or an addition to the wealth of the world. Food is an article of production destined to be immediately consumed, but the food of the working man sustains him while he is producing more than he consumes. A thousand pounds spent in improving a thousand acres of land, or in building a house, produce something which lasts for many years ere it is consumed or rendered valueless. The same sum spent in raising a wheat crop will seem to be immediately consumed, but it may have in reality been laid out more beneficially than the other, through the process of reproduction. If the thousand pounds laid out on land increases the value of that land so as to make it worth eleven hundred pounds, while the wheat raised by the expenditure of the other thousand is sold for fifteen hundred pounds, there is less C. in the latter expenditure than the former. If the thousand pounds, on the other hand, be expended on squibs and sky-rockets, the C. is greater still. The makers of the squibs and sky rockets no doubt live, but it would tend less to C. if they lived by making something that would last.

CONTACT. In geometry, two lines, one of which at least is curved, are said to be in C. when they have a common point from which they recede, in such a way that the deflection of the one from the other will, if a sufficiently small departure be taken, become as small a fraction as we please of that departure. A complete discussion of the nature and order of C. can be obtained only by means of the differential calculus.

CONTAGION, the communication of a disease from the sick to the healthy, either by direct contact of a part affected with the disease, or through the medium of the excretions and exhalations of the body. Some authorities have employed the term infection

(q.v.) to designate this latter method of communication, and have correspondingly limited the meaning of the word C.; but no practical end is served by this refinement, and it has indeed led to great confusion by obscuring the fact of the communication, which is, when clearly proved by instances, the most important element in the inquiry. If of a given number of healthy persons exposed to association with the sick, a much larger proportion becomes ill than can be reasonably accounted for on general principles, or than is actually observed among persons of similar habits not exposed to this cause of disease, the disease is said to be propagated by C.; and if the characters of the disease are well marked, and nearly similar throughout the group of cases, it is said to be due to a specific C., which may be in some cases shown to be capable of reproducing the primary disease to an illimitable extent, being conveyed (as in the case of syphilis, q.v.), either through the liquid secretions of the affected part, or (as in the case of small-pox) in this way, and also through the aërial exhalations. Contagious diseases are generally epidemic (q.v.) in their mode of propagation, attacking large numbers of people at once, and traveling from place to place. But some epidemics are not contagious, as influenza (q.v.).

CONTAGIOUS DISEASES (WOMEN) **ACTS** were passed in 1865, 1867, and 1868 for the seaport and military towns, Aldershot, Canterbury, Chatham, Colchester, Dover, Gravesend, Maidstone, Plymouth and Devonport, Portsmouth, Sheerness, Shorncliffe, Southampton, Winchester, Windsor, and Woolwich; and in Ireland, the Curragh, Cork, and Queenstown. The policy of these acts has since been keenly canvassed, one party denouncing them as demoralizing and degrading, the other party defending them on purely sanitary grounds. They authorize a justice of the peace, on the sworn information of a superintendent of police that a woman within the above area is a common prostitute suffering from venereal disease, to cause her to be examined, and, if necessary, detained in an hospital. She is, however, first entitled to notice, so that she may submit voluntarily to examination. The limit of detention in hospital is three months to nine months. She may be convicted for refusing to attend for examination, and imprisoned for one month; and, for a second offense, three months. If she considers herself cured, she can demand to be taken before a justice, who, on reasonable evidence, can discharge her. Occupiers of houses are liable to a penalty for permitting a woman uncured to resort to or be in their houses. The justice hears the case in private; but, if the woman demands it, he must hear her in open court.

CONTARINI, the name of a noble family in Venice, one of the twelve that elected the first doge. Between 1041 and 1674, seven doges were furnished by this family, and several of its members were men of note.—AMBROGIO C. was sent as ambassador from Venice to Persia, 1473–77, and gave an account of his travels in his *Viaggi fatti da Vinetia, alla Tana, in Persia, in India, et in Constantinopoli* (Ven. 1487).—CARDINAL GASPARO C. distinguished himself as Venetian ambassador at the court of Charles V., and was papal legate at the diet of Ratisbon, 1541, where he displayed great moderation.—GIOVANNI C., b. 1549, was one of the most famous painters of his time; he painted the "Resurrection," in San Francisco di Paolo's, in Venice.—VINCENZO C., b. 1577, had acquired, at the age of 26, such a fame for learning, that the magistrates of Padua, in order to secure him for their university, established an extraordinary professorship of Greek and Latin eloquence.

CONTEMPT, against the crown's ecclesiastical supremacy, by assuming local ecclesiastical titles under the authority of the court of Rome, is forbidden under penalties by 10 Geo. IV. c. 7, s. 24, and by 14 and 15 Vict. c. 60.

CONTEMPT, against the sovereign's title. See PRÆMUNIRE.

CONTEMPT OF COURT. There is probably no country in which courts of law are not furnished with the means of vindicating their authority and preserving their dignity by calling in the aid of the executive, in certain circumstances, without the formalities usually attending a trial and sentence. Of this, the simplest instance is where a judge orders the police to enforce silence, or to clear the court. Contempts by resisting the process of a court, are in England punished by attachment (q.v.); contempts done in the face of the court, by directly obstructing its proceedings, may be visited with commitment and fine. Striking a supreme judge in the discharge of his duty, or even threatening him by drawing a weapon, or the like, has been an offense at common law in England of the highest kind since the times of the Anglo-Saxons; and in Scotland, it is a statutory offense, punishable either capitally or by very severe arbitrary pains (1593, c. 173; 1600, c. 4). See JUDGE. In the latter country, minor contempts are punishable arbitrarily, either *ex proprio motu* of the court, where the offense has come under its immediate observation, or by a summary complaint at the instance of the public prosecutor, where, though not committed in the immediate presence of the court, it has relation to a matter which is, or has been recently, in dependence before it.

CONTEMPT OF COURT (*ante*), generally manifests itself in the disregard by an inferior court of the orders of a superior court, by the non-payment of costs, the misconduct of ministerial officers, and by the malpractices of attorneys; and may be punished summarily without trial. In this country, great license is given to the press in

their comments on cases before court; in some states, it is even permissible to criticise evidence. In most states, contempt of court is carefully regulated by statute.

CONTEMPT OF PARLIAMENT. See PARLIAMENT.

CONTI, HOUSE OF, a branch of the house of Condé (q.v.). Armand de Bourbon, first prince of C., and brother of the great Condé, was b. at Paris in 1629. He took his title from the little town of Conti, situated five leagues from Amiens. Of a feeble constitution and deformed shape, he was early destined for the church, but the fame of his brother inspired him with military ardor. He commenced his martial career as the opponent of his brother, but soon entered into alliance with him. After 1657, he retired from the world, and gave himself up, without reserve, to devotion. He died at Pezenas in 1666.—LOUIS ARMAND, prince de Conti, comte de Pezenas, and peer of France, eldest son of the preceding, was born in 1661. After a short career in arms, he died of small-pox at Fontainebleau, 5th Nov., 1685. He left no children, and was succeeded by his brother FRANÇOIS LOUIS, prince de la Roche-sur-Yon et de Conti, who was born at Paris in 1664. This was the most remarkable member of the family. Educated under the eyes of the great Condé, he early conceived a passion for bearing arms. His first campaign was made in Hungary, where he distinguished himself; but having fallen into disgrace with the court, he was banished to Chantilly, with strict orders not to leave it. The great Condé, before his death, persuaded Louis XIV. to pardon him. Subsequently, C. served under the duc de Luxembourg, who was warmly attached to him, and took a brilliant part in the victories of Steinkirk and Neerwinden. In 1697, he narrowly escaped being made king of Poland. On his return to France, he was still coldly received by Louis, who, however, was at last forced by disaster to employ him. He received the command of the army of Flanders in 1709, but died on the 22d of Feb. of the same year. Massillon pronounced his funeral oration. Saint-Simon, in his celebrated *Mémoires*, thus speaks of him: "He was the delight of armies, the divinity of the people, the hero of officers, the darling of parliament, and the admiration of the most learned savans."—The last member of the house of C. was LOUIS FRANÇOIS JOSEPH, b. 1734, d. in Spain, 1807.

CONTINENT. Though no mathematical distinction has ever been drawn between a C. and an island, the usage of language has generally recognized five great masses or divisions of land as continents—Europe, Asia, Africa, America, and Australia. Europe, Asia, and Africa form properly one great C., the only one known to the ancients; the second was discovered by Columbus; and the third made its appearance at the antipodes of Europe in the beginning of the 17th century. The existence of an antarctic C. has not yet been satisfactorily established. The apparent irregularity in the shape of the continents disappears on nearer examination, and certain uniformities become apparent, the causes of which have long been subjects of speculation. Bacon remarked, that the continents were pointed towards the south polar sea, and presented broad conformations toward the north. J. R. Forster followed up this remark by the generalization, that these southern points are the ends of mountain-ranges, which are continued northwards; and that at the e. side of these promontories there are always larger or smaller archipelagos of islands, while the w. side of the continents is indented with large bays.

Not only have attempts been made to reduce the horizontal outlines of the continents to rule, but their vertical dimensions have been examined with the same view. Observation had been confined to ascertaining the heights of individual summits, until Alexander von Humboldt enriched physical geography with a new numerical element, by endeavoring to determine the mean height of continents—i.e., the elevation of the center of gravity of their mass. He estimated the mean height of Europe at 103 toises (a toise is about 6 ft. 6 in.), of North America at 117, of South America at 177, and of Asia at 180 toises. Laplace had calculated the mean height of all the continents at 1000 meters; Humboldt found this too great by two thirds, and gives the height of the center of gravity of all the continents, except Africa, above the sea-level at 307 meters, or 1007 feet.

CONTINENTAL, a term intended as the opposite of provincial, assumed by the revolted American colonies early in the war of the revolution, an effort being made to induce Canada to join the thirteen colonies. Had the Canadians agreed, the whole of the continent under English rule would have been in revolt. The first general representative body of the thirteen colonies was called the "Continental Congress."

CONTINENTAL SYSTEM; BERLIN DECREE; ORDERS IN COUNCIL. The C. S. was the name given to Napoleon's plan for shutting England out from all connection with the continent of Europe, and thus compelling her at least to acknowledge the maritime law established at the peace of Utrecht. See NEUTRALITY. This system began with Napoleon's famous "Berlin decree" of Nov. 21, 1806, which declared the British islands in a state of blockade, and prohibited all commerce or correspondence with them; every Englishman found in a country occupied by French troops or by their allies was declared a prisoner of war; all merchandise belonging to an Englishman, lawful prize; and all trade in English goods entirely prohibited. No ship coming direct from England, or from a British colony, was allowed to enter any port; and any ship seeking by false declarations to evade the regulation, was confiscated with its cargo as if British property.

England was not long in making reprisals. By an "order in council," issued Jan. 7, 1807, all neutral vessels were prohibited from entering any port belonging to France or her allies, or under her control. Every neutral vessel violating this order was to be confiscated with its cargo. Still more oppressive for neutral commerce was a second order in council of Nov. 11, 1807, by which all harbors and places of France, and her allies in Europe and the colonies, as well as of every country with which England was at war, and from which the English flag was excluded, were placed under the same restrictions as if strictly blockaded. These orders were followed by reprisals on the French side. By the Milan decree of Dec. 17, 1807, strengthened by a second of Jan. 11, 1808, from the Tuileries, any vessel, of whatever nation, that had been searched by an English ship, had submitted to be sent on a voyage to England, or paid any duty to the English government, was to be declared *denationalized*, and treated as English. In order the more effectually to annihilate English commerce, there appeared, Aug. 3, 1810, the tariff of Trianon for colonial goods; this was extended by a decree of 12th Sept., and on the 18th Oct. followed the decree of Fontainebleau, ordering the burning of all English goods; an order which was to be carried out with more or less modification in all countries connected with France.

The consequence of the C. S. was undoubtedly the springing up on the continent of many branches of manufacture to the prejudice of England; on the other hand, the price of foreign produce rose to an extraordinary height on the continent, enabling a few commercial men to make fortunes, but sensibly affecting the daily comfort of the middle classes. This violent interruption of human intercourse and sociability was an unnatural condition, which could not last long, and could only serve to strengthen the hatred of Europe against French tyranny. Accordingly, with the breaking up of Napoleon's power, the C. S. fell to the ground.

CONTINGENCY, in law, an event the occurrence of which, though uncertain, is sufficiently probable to be provided for. Thus, contingent debts, by the law of Scotland, are taken into account in estimating the claims on the estate of a bankrupt, though a contingent creditor is not entitled to concur in a petition for sequestration, or to vote in the election of a trustee, until his claim shall be valued.

CONTINGENT is the quota of troops furnished to the common army by each member of an alliance or confederation of states. The word was especially applied to the proportions contributed by the several German states to the army of the confederation, which has given place to the empire. See GERMANY.

CONTINUED FRACTIONS. See FRACTIONS.

CONTINUITY, LAW OF, a principle made known by Leibnitz, which asserts that nothing passes from one state to another without passing through all the intermediate states.

CONTOR'NIATE (Ital. *contorno*, Fr. *contour*), a term applied to a class of antique medals which have a deep line cut round the edge, like a furrow.

CONTORTED STRATA are beds which are bent and twisted, so that in a section their edges would be seen to follow crooked and curved lines, often doubling back and running altogether out of their former course. An account of extensive C. S. will be found under the article APPALACHIANS.

CON'TRA, a term in music, meaning opposite, lower, and applied to the alto and tenor parts when they form the lowest part in the harmony. When a part lower than the usual bass is employed, it is called contra-basso. C. is also used in organ-building, to indicate that a certain stop, or register of pipes, is an octave lower than the usual pitch.

CONTRA BASS, or VIOLONE, the largest species of stringed instrument, commonly called the double bass. In Britain, this class of instrument has three strings, the lowest being A, a minor third below the low C of the violoncello; the next is a fourth above, viz., D; and the highest is G, a fourth above D. This manner of stringing is defective, as all the great masters have written for the C. B. down to E, for which reason the German instruments have all four strings, the lowest a fourth below our low A. C. B. is also the name of an organ stop of 16 ft. pitch.

CONTRABAND OF WAR (Lat. *contra bannum*, against the proclamation), is a name applied to certain commodities, or the rules relating to them, during hostilities between states which acknowledge what are called the laws of nations. One such law is, that neutral nations must not carry on, for the advantage of either of the belligerent powers, any branches of commerce from which they are excluded in time of peace. Another is, that the name of C. of W. shall be given to such articles as pertain to military or naval warfare—guns, ammunition, and stores of all kinds. Unless there are special treaties, defining exactly what articles are C. of W., the interpretation of this law often leads to much embarrassment. Another law insisted on by England during the last great war was, that each belligerent shall have a right to visit and examine neutral ships, to see whether they carry any articles which are C. of W., and which seem likely to be intended for the enemy. A neutral state may carry on ordinary trade with either belligerent, except when prevented by blockade (see BLOCKADE); but the ships,

according to the above rules, must not contain articles C. of W.; nor must a conterminous land frontier be crossed by such commodities. If a merchant evades these rules, he does so at his own risk; his merchandise may be seized, and his own government will not protect him. By the law and practice of nations, it is for the admiralty court of the capturing power to decide what is or what is not contraband of war. Upon such questions it is the province of this tribunal to adjudicate; and from its final judgment there is no appeal. At various times, discussions have arisen whether corn, hay, or coal, can ever be included in the list of articles C. of W.; they are obviously articles of peaceful commerce, but they are also essential to the maintenance of an army, and sometimes a supply would give one belligerent a great advantage over the other. Especially is this the case in reference to coal, in the present age of war-steamers.—Contraband in commerce depends upon the special laws of each country. See SMUGGLING.

CONTRA COSTA, a co. in w. California, on San Francisco and Suisun bays, 756 sq.m.; pop. '80, 12,525. In the s. portion are several mountains, the chief of which is Mt. Diablo, but most of the surface is level, and the soil is fertile. Salt and sulphur springs are numerous, and there are valuable coal-mines. Quicksilver and copper also are found. Chief productions, wheat, oats, barley, hay, cheese, butter, wool, and wine. Co. seat, Martinez.

CONTRACT. For a statement of the principles on which contracts in general are founded, see CONSENT.

CONTRACT (CONSENT, *ante*), an agreement between two or more parties to do or not to do a particular thing. There are several varieties of contract besides the ordinary agreement which almost every person understands. The chief of these are: Accessory contracts made to assume the performance of a prior contract, such as a suretyship, mortgage, etc.; a contract of beneficence, where only one of the parties is benefitted, as loans, deposits, etc.; certain contracts in which the thing to be done is supposed to depend on the will of the party, or when, in the usual course of events, it must happen in the manner stipulated; commutative contracts, in which what is done, given, or promised by one party, is considered an equivalent to, or in consideration of, what is done, given, or promised by the other; consensual contracts, formed by the mere consent of the parties, such as hiring out; executed contracts, those in which nothing remains to be done, as in a sale with payment and delivery on the spot; entire contracts, where the consideration is entire on both sides; executory contracts, in which some act remains to be done, as an agreement to do a certain thing at a future time; express contracts, where the terms of agreement are openly uttered and avowed at the time of making; gratuitous contracts, in benefit of the person with whom made, without profit or advantage received or promised as a consideration; hazardous contracts, in which the performance depends upon some uncertain future event; implied contracts, such as reason and justice dictate, and which the law presumes that every man undertakes to perform; independent contracts, in which the neutral acts and promises have no relation to each other as equivalent or considerations; mixed contracts, where one of the parties confers a benefit on the other, receiving something of inferior value in return; contracts of mutual interest, entered into for the common and reciprocal interest of both parties, such as partnership; onerous contracts, where something is given or promised as a consideration for the engagement or gift, or some service, interest, or condition is imposed on what is given or promised, although unequal to it in value; oral contracts, ordinary simple agreements; principal contracts, where both parties act on their own account; real contracts, where there must be something more than mere consent, such as a loan, pledge, or deposit, which from their nature require the delivery of the thing itself; reciprocal contracts, mutually agreeing together in business, such as sales, hire, and the like; contracts of record, such as are evidenced by record made, such as judgments, recognizances, etc. (The foregoing are the higher class of contracts.) Severable contracts are those in which the considerations are, by their terms, susceptible of division on either side, as agreeing to pay for a certain work as long as it is done in a certain way. Simple contracts are the lowest form of contracts; mere non-recorded parol agreements. Unilateral contracts are those in which the party to whom the engagement is made makes no express agreement on his part. As to the qualities of contracts, the agreement should be so complete as to give either party his action upon it, and both parties must assent to all its terms. There must be a good and valid consideration. The thing to be done must be one not forbidden by law; immoral as well as fraudulent contracts are void, and so are contracts against public policy, even though not forbidden by statute. The intention of the parties is the marrow of the contract, and this is the key for construction by a court. Words are, if possible, taken in their comprehensive and common-sense meaning.

CONTRACTIL'ITY, the property by which the particles of certain substances resume their normal position when the force that pulls them apart is suspended. Contractility is also the power in animal muscles by which the limbs are moved.

CONTRACTIONS. The wish or necessity of economizing labor and parchment, led the scribes of the middle ages to use a great many abbreviations or C. in their manu-

scripts. These C. were transplanted into the first printed books; and more recently they have been reproduced in many works, as well in this country as on the continent, where it was thought desirable that the modern print should represent as nearly as possible all the peculiarities of the ancient manuscript. A knowledge of C., therefore, is indispensable, not only to readers of old writings, but to readers of the printed books of the 15th, the 16th, and the earlier part of the 17th centuries, and to all who desire to avail themselves of the vast stores of historical and archæological materials accumulated in the rolls and records published by the governments of Great Britain, France, and other countries.

C. may be divided into six classes: 1. C., properly so called; 2. C. by elision or suspension; 3. C. by writing a smaller letter above the word contracted; 4. C. by running two or more letters into one character; 5. C. by symbols representing syllables or words; 6. C. by initial letters.

1. *Of C., properly so called*, there are three great kinds: (I.) A straight line over a letter denotes the omission of an *m* or an *n* after it.

(II.) A crooked or circumflex line over or through a letter signifies that one or more letters are omitted after it—occasionally both before and after it.

(III.) The sign ⁊ over a letter shows that *er*—or occasionally *re*—is omitted after it.

2. *In C. by elision or suspension*, the word is not fully written, the want of the terminating letters being denoted by the marks ⁓, or ', or .; thus: ass ⁓, *assisa;* test', *teste;* dat., *datum;* temp., *tempore.*

3. *C. by writing a smaller letter above the word contracted.*—If the letter so written be a vowel, it denotes the omission of a consonant; if a consonant, the omission of a vowel. Occasionally the omission extends to two or more letters, whether vowels or consonants.

4. *Of C. by running two or more letters into one character*, the diphthongs æ and œ, and the sign & for *et.* are familiar examples.

5. *C. by symbols representing syllables or words.*

6. *Of the more common C. by initials*, a list has already been given in this work, under Abbreviations (q.v.). In this way of writing, a whole sentence may be expressed without so much as one word being written at length, as in the well-known epistolary form S.V.B.E.E.Q.V.; that is, *Si vales, bene est, ego quidem valeo.* Among the initials used in old writings and books, it will suffice here to mention the following:

A.	Alexander, Alanus, Arthurus.
B.	Benedictus, Bernardus, Bonifacius.
B.M.V.	Beata Maria Virgo.
B.P.	Beatus Paulus, *or* Petrus.
B.V.	Bene vale.
C.TT.	Cardinalis Tituli.
D.	David, Durandus, Duncanus.
D.N.PP.	Dominus Noster Papa.
E.R.	Ecclesia Romana.
F.F.F.	Fiat, Fiat, Fiat.
G.	Gulielmus, Gilbertus, Guido, Georgius.
G.G.	Gregorius.
I.C. or I.X.	Jesus Christus.
I.D.N.	In Dei Nomine.
J.	Johannes, Jacobus, Julietta, Josephus.
M.	Malcolmus, Martinus, Matilda, Maria.
N.E.R.	Notarius Ecclesiæ Romanæ.
O.S.B.	Ordinis Sancti Benedicti.
P.S.R.I.	Princeps Sacri Romani Imperii.
R.	Robertus, Rolandus, Ricardus.
R.P.D.	Reverendissime Pater Domine.
S.	Symon, Samuel, Siwardus.
S.C.M.	Sacra Cæsarea Majestas.
S.D.	Salutem Dicit.
S.D.N.R.	Supremus Dominus Noster Rex.
S.M.E.	Sancta Mater Ecclesia.
S.P.	Sacri Palatii.
S.R.E.	Sacra Romana Ecclesia.
S.V.	Sanctitas Vestra.
T.	Thomas, Turgodus, Thoraldus.
V.R.P.	Vestra Reverendissima Paternitas.
V.S.	Vestra Sanctitatis.
W.	Wilhelmus, Walterus, Wido.

Doubling an initial, shows that it is to be taken in the plural sense, as PP. for Papæ, TT. for Tituli, MSS. for manuscripts.

C. Corrupted.—The Anglo-Saxon denoting *th*, has been corrupted into *y*; whence y^e^ is put for *the*, y^r^ for *their*, y^n^ for *then*.

Collections of C. have been engraved in *fac-simile* in several works, among which may be enumerated Baring's *Clavis Diplomatica*, Hanov. 1737 and 1754; Anderson's *Dip-*

lomata Scotiæ, Edin. 1739; Walther's *Lexicon Diplomaticum*, Gotting. 1745; the *Nouveau Traité de Diplomatique*, Paris, 1750–65, one of the many noble works of the Benedictines of St. Maur; Lemoine's *Diplomatique Pratique*, Metz, 1765; Trombelli's *L'Arte di conoscere leta de' codici Latini ed Italiani*, Bologn. 1756 and 1778; M. Nat. de Wailly's *Eléments de Paléographie*, Paris, 1838; M. L. Alph. Chassant's *Paléographie*, Paris, 1839 and 1854, and his *Dictionnaire des Abréviations*, Evreux, 1846.

CONTRAVENTION, in the law of Scotland, any act done in violation of a legal condition or obligation. The term is most frequently applied: 1. To an act done by an heir of entail, in opposition to the provisions of the deed; 2. To an act of violence or molestation, in opposition to Lawburrows (q.v.). Stair, i. 9, s. 30, and iv. 48.

CONTRAYER'VA, a medicine once in much repute against low fevers, and as a mild stimulant and diaphoretic, and still used in some countries, although not much in Britain, consists of the root-stocks (rhizomes) of different species of *dorstenia*, a tropical American plant of the natural order *moraceæ*. The genus is remarkable for the plane receptacle in which the numerous small flowers are fixed; the male flowers in superficial depressions, the female flowers in deep sockets. The flowers have neither calyx nor corolla. The fruit consists of *achenia*, imbedded in the fleshy receptacle from which they are projected by elastic force when ripe. *D. contrayerva* is a perennial plant, with palmate leaves, and somewhat quadrangular receptacles. Its root-stock is knotty, 1 to 2 in. long, about ¼ in. thick, reddish-brown, pale within, sending out on all sides many slender fibers (roots), which are generally loaded with small brown knots. It has a peculiar aromatic, overpowering smell, and a somewhat astringent, warm, bitterish taste. It keeps badly. It contains so much mucilage, that a decoction of it will not pass through a filter.—*D. Brasiliensis*, a stemless species, with oblong, heart-shaped leaves and a circular receptacle, a native of the West Indies and Brazil, possesses similar properties, but is said to be more energetic, and furnishes the C. of British commerce. Other species possess similar properties. They have been also represented as efficacious against serpent-bites, and hence the name C., a *counter-poison*.

CONTRERAS, a village about 12 m. s.e. of the city of Mexico, where a battle occurred between the Americans under gen. Scott and the Mexicans under gen. Valencia. It was a part of the battle of Churubusco.

CONTROL'LER, an officer whose duty it is to keep financial accounts, or to see that they are properly kept and audited. In the U. S. treasury department there are the first and second controllers to examine accounts and sign drafts; and also a controller of the currency, who furnishes circulating notes to banks. In some of the states, as New York, a controller is elected by the people who has general charge of the financial affairs of the state. There is also a controller in the city of New York, elected by popular vote.

CONTUMACY, a Scotch law-term, in one sense equivalent to non-appearance in England (see DECREE IN ABSENCE; DEFAULT); but sometimes used in the wider sense of disobedience to a judicial order. In a criminal process, C. is punished by a sentence of fugitation; in a civil process, its only consequence is that the case will be proceeded with, and decree pronounced against the contumacious defender.

CONVALESCENT HOSPITALS, although as yet rare in this country, are institutions of the greatest importance. All who are acquainted with our ordinary hospitals, which are often situated in crowded parts of populous cities, must feel that a very considerable number of patients must almost of necessity die soon after returning to their own unhealthy homes, simply for want of an institution where convalescence may by developed into perfect health, under the general influences of pure air, gentle exercise, and a nourishing and well-regulated diet. The convalescent hospital must be regarded as a stage in the process of cure intermediate between the ordinary hospital and the patient's home: it is an equally necessary addition both to civil and military hospitals. One of the greatest of our military surgeons, Robert Jackson, writing in 1803, recommends "separate and detached houses," and the removal of convalescents "to other apartments or hospitals." He states his firm conviction, as based on long and most extensive experience, that soldiers, in a state of convalescence, recover their health better and sooner in sheds, huts, and barns, exposed occasionally to wind and rain, than in the most superb hospitals in Europe. "Pure air," he adds, "in this respect, is alone superior to all forms of cure, and to all other remedies without such aid." The same great authority frequently notices relapse as being the leading cause of mortality in general hospitals.

The magnificent establishment at Vincennes, founded in 1857 by the late emperor of the French, may be taken as a type of what convalescent hospitals ought to be. We borrow the details from sir James R. Martin's article on "Convalescent Hospitals" in Holmes's *System of Surgery*. It is composed of a main building, with two long wings, two stories high, with a ground floor, and contains more than 400 beds. It contains a chapel, airy dining-halls with marble tables and convenient seats, a library, and play-rooms; the wings in both stories being subdivided into rooms, each containing three beds, and looking towards the south. Each patient has the use of a press, with lock and key. There is ample garden-ground attached to the building. The mean duration

of residence is 22 days, the patient remaining till he is either completely cured, or declared incurable. The diet is regulated by the director and head physician, and usually consists of soup at 7:30 A.M.; meat and vegetables at 10:30 A.M.; soup, roast meat, vegetables, and salad or dessert at 5 P.M.; each convalescent receiving a pint of Burgundy, and as much bread as he may choose. Numerous means of diversion, as skittles, balls, draughts, dominoes, etc., are afforded, but cards are prohibited; and the library, the greater part of which has been presented by Paris book-sellers, is much resorted to, there being on an average 50 readers. The conduct of the inmates is exemplary. They are allowed to see their friends thrice a week. The officers are a director, treasurer, head physician, and 3 house-surgeons; 6 nurses, a chaplain, 5 clerks, a storekeeper, 4 overseers, and 40 subalterns. The simple fact that this hospital, in less than three years, administered relief to 14,000 convalescent artisans, affords undoubted evidence, were such evidence required, of the utility of such institutions. Several establishments of the kind are already in operation in England. One, for 50 to 60 patients, was erected in 1867 near Edinburgh; and a large one has recently been built at Lenzie junction, near Glasgow.

CONVALLA'RIA. See LILY OF THE VALLEY.

CONVENT. See MONASTERY.

CONVENTICLE (Lat. *conventiculum*, a diminutive of *conventus*), originally meant a cabal among the monks of a monastery, formed to secure the election of a favorite as abbot. The word consequently fell into disrepute. It was first given as an appellation of reproach to the assemblies of Wickliffe's followers, and was afterwards applied to the meetings of the English and Scottish non-conformists. Severe statutes were often passed for the suppression of these conventicles. See ACT OF TOLERATION, TEST ACTS.

CONVENTION, NATIONAL. See NATIONAL CONVENTION.

CONVENTIONAL, in art, is that which is in accordance, not with the absolute principles of beauty in form and color, but with the opinions and sentiments with reference to forms and colors, which chance to prevail at a particular time, in a particular country, or social class. Conventionality in art holds the same relation to the beautiful that conventionality in morals does to the good, or in speculative opinion to the true.

CONVENTION PARLIAMENT. It is a branch of the royal prerogative, that no parliament shall be convened by its own authority, or by any other authority than that of the sovereign. Where the crown is in abeyance, this prerogative cannot of course be exercised, and the expedient of convention parliaments has been resorted to, the enactments of which shall afterwards be ratified by a parliament summoned in accordance with the provisions of the constitution. The C. P. which restored Charles II. to the throne met above a month before his return, and was afterwards declared to be a good parliament, notwithstanding the defect of the king's writs (13 Car. II. c. 7 and c. 14). In like manner, at the revolution of 1688, the lords and commons, on the summons of the prince of Orange, met in convention, and disposed of the crown and kingdom, and this convention was subsequently declared (1 Will. and Mary, st. 1, c. 1) to be really the two houses of parliament, notwithstanding the want of writs and other defects of form. Under the name of CONVENTION, there also took place a meeting of the estates of Scotland, called by the prince of Orange on the same occasion. This meeting commenced on the 14th of Mar., 1689, and was turned into a parliament on the 5th of June thereafter. The principal act of the convention was to settle the Scottish crown upon William and Mary. After these precedents, we are perhaps almost entitled to regard the meeting of a C. P. as the constitutional mode in which the general will of England expresses itself on such questions as cannot be constitutionally discussed in parliament—e.g., a change of the reigning dynasty.

CONVENTION OF ROYAL BURGHS, in Scotland. The burgh system of Scotland is very ancient (see BURGH), but it was by stat. 1487, c. 111, that the royal burghs of Scotland were first ordered to hold an annual meeting by commissioners, at what is now the unimportant town of Inverkeithing, where "the welfare of merchandise, the gude rule and statutes for the common profit of burrows," should be discussed, "and which should provide for remeid upon the skaith and injuries sustained within the burrows." This convention is conjectured by Mr. Burton to have taken the place of the more ancient "court of the four burghs"—Edinburgh, Stirling, Berwick, and Roxburgh. The powers conferred by this act, which were renewed by later statutes, are still in force, and in virtue of them the C. of R. B. meets annually in Edinburgh on the second Tuesday of July. This court had a partial jurisdiction in questions as to the general regulation of trade, along with legislative authority over the constitutions of the burghs, which, previously to the passing of the burgh reform act, included a right to adjust their "setts" (q.v.). Its operations are now almost entirely limited to discussing measures connected with trade, for which it may be proposed to apply to parliament. In this respect, it acts in the character of something like a general chamber of commerce (q.v.).

CONVERGING, or CONVERGENT, is applied, in geometry, to straight lines that meet or tend to meet in a point; looked at in a direction from the point, they are *divergent*, or separating. C. and divergent are often used in reference to rays of light. See CATOPTRICS. In algebra, the term convergent is applied, in a loose way, to any infinite series

the terms of which go on diminishing; while a series is called divergent when its terms continually increase. Strictly, however, a C. series is one whose terms diminish in such a way that no number of them added together will be as great as a certain given number. Thus, however far we extend the series, $1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8}$, etc., the sum will never amount to 2, though always approaching nearer to it. But the series, $1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} +$ etc., has no such limit, and is therefore not convergent in this sense.

CONVERSA'NO, a t. of south Italy, in the province of Bari, about 19 m. s.e. of the city of that name. It is pleasantly situated on a hill in a fertile wine, oil, almond, and cotton producing district. It has a cathedral and several convents. Pop. about 10,500.

CONVERSE AND **CONVERSION** are terms in logic, signifying that one proposition is formed from another by interchanging the subject and predicate: as, "Every A is B;" the C. of which is, "Every B is A." This example is termed a case of *simple* conversion; besides which, however, logicians recognize two other kinds of conversion—viz., *limited* conversion, and conversion by *contraposition*. The former may be exemplified thus: "Every A is B;" the limited C. of which is, "*Some* Bs are As;" and the latter thus: "Some A is not B;" which, converted by contraposition, is, "Something that is not B is A;" "Some men are not wise; some beings that are not wise are men." Of these logical converses, the second and third are *necessarily* true, but not the first. When we say, "Every A is B," the reader might at first sight conclude that "Every B is A" also; but if, instead of these letters, to which he probably attaches no meaning, he employ terms denoting objects with which he is familiar, he will see that a simple C. may be very far from the truth. Thus, "Every penny is a coin," has for its simple C. "Every coin is a penny." The reason why a simple C. is not necessarily true is, that in such a proposition as "Every A is B," the subject "A" is—to speak logically—universally distributed, whereas the predicate "B" is not. If it were, the proposition would read as follows: "Every A is *every* B;" the simple C. of which, "Every B is every A," would be true.

CONVERSION, in law, an unauthorized assumption and exercise of the rights of ownership over goods or personal chattels belonging to another, to the alteration of their condition or the exclusion of the owner's rights. Direct conversion is when the person actually appropriates the property of another to his own use, or destroys it, or alters its nature. Constructive conversion is when a person does such acts in reference to the goods, or personal chattels of another as amount, in view of the law, to appropriation of the property to himself. In equity, conversion is the exchange of one species of property for another, which, in the consideration of the law, takes place under some circumstances, although no such change has actually taken place. Land is held to be converted into money, in equity, when the owner has contracted to sell; and if he die before making a conveyance, his executors, and not his heirs, will be entitled to the money.

CONVERTER, in metallurgy, a receptacle holding iron which is to be converted into steel; a spherical vessel, lined with fire-clay, the bottom having numerous holes through which a powerful blast is driven during the process. From this vessel the liquid steel is poured into molds.

CONVEX. See CONCAVE.

CONVEY'ANCE, in law, is the deed or writing by which property is conveyed or transferred from one person to another. The term, though strictly applicable, is not generally applied to the act of transferring personal, or, as it is called in Scotland, movable property. As regards real or heritable property, the more special nature of a C., and the consequent duties of the conveyancer, in so far as they fall within the scope of this work, will be explained under separate heads. See, for England, FEE, FREEHOLD, COPYHOLD, LEASEHOLD, MORTGAGE, CHATTELS, BILL OF SALE, ASSIGNMENT, FEOFFMENT, DEED, COMMON FORMS, GRANT, TRUST, SETTLEMENT, USAGES, etc.; and for Scotland, FEU, SUPERIOR, VASSAL, WARD-HOLDING, MORTIFICATION, BLANCH-HOLDING, BURGAGE-HOLDING, CHARTER, SASINE, DISPOSITION. A statement of the general nature of a C., and of the feudal system, with which the conveyancing of many of the countries of Europe is still so intimately connected, will be given under CONVEYANCING.

CONVEY'ANCER is a person who practices the art of preparing the deeds or writings used for the conveyance or transference of property from one person to another. Conveyancers in England are generally barristers, who in most instances belong to the equity bar. There is also a special class of practitioners, known by the name of conveyancers, who are members of the inns of court, though not called to the bar. These must take out an annual certificate. But although most deeds respecting real estate are drawn by conveyancers, they are also the ordinary work of an attorney or solicitor, and may be drawn indeed by any party, if he chooses to take the risk.

CONVEY'ANCING is the art of preparing the deeds or instruments used for the transference of property from one person to another. Such writings form the title or evidence of the right of the person possessing or claiming possession of property; and it is of the greatest importance that the conveyancer employed to prepare them, should be possessed of a competent knowledge of the law as applicable to such deeds, and have the

skill required to frame them in such a form as clearly to express and attain the object intended. In the earliest stage of society, there was no call for the profession of a conveyancer; property was held in right of occupancy, without any written title, and was also conveyed from one to another without writing, the new owner being usually put in possession in presence of witnesses called for the purpose, by some symbolical form, such as the delivery of earth and stone to represent the land, a wand to represent wood, grass and corn to represent tithes, and other appropriate symbols to represent mills, fishings, or other kinds of property.

In the earlier period of the history of the Jews, the symbolical mode of changing the ownership of property was curious. "Now this was the manner *in former time* in Israel concerning redeeming and concerning changing, for to confirm all things: a man plucked off his shoe, and gave it to his neighbor: and this was a testimony in Israel" (Ruth iv. 7). In later times, the Jews appear to have had a much more artistic system of C., making use of all the safeguards that are used in modern times—viz., writing, witnesses, subscribing, sealing, and recording the documents. There is a very distinct account of a Jewish conveyance in the later period in Jeremiah xxxii. 9–12. "And I bought the field of Hanameel, and weighed him the money. And I subscribed the evidence, and sealed it, and took witnesses. So I took the evidence of the purchase, both that which was sealed according to the law and custom, and that which was open: and I gave the evidence of the purchase unto Baruch, in the sight of Hanameel [the seller], and in the presence of the witnesses that subscribed the book of the purchase, before all the Jews that sat in the court of the prison."

The Romans made no distinction in principle between real and personal or movable and immovable property, in their conveyancing. Each kind of property was held free of any superior. Their deeds were therefore simple, not requiring any reservation or declaration of the superior's rights. They had public registers in which conveyances were recorded. After the invasion of the southern by the northern nations, the feudal system spread over nearly the whole of Europe, and C. was regulated in accordance with it; the rights of the superior and the rights of the vassal or proprietor being carefully distinguished. The leges barbarorum, contained in the Burgundian code, and the code of the Longobardi, embody the older feudal uses, from which the modern are derived. In the 7th c., a work of peculiar interest to the conveyancer was compiled by Marculfus, a monk, containing the germs of modern conveyancing. It is in substance a book of styles or forms of deeds, partly Roman and partly feudal. The genius of the system of land-rights derived from the barbarians was to concentrate the property of land, for the sake of individual power; while the Roman laws and customs tended in the opposite direction, for they treated land in regard to succession like movables, as the French now do, dividing it among the whole members of a family. Alienation by sale or gift was freely permitted, a power long denied by the feudal rules. Indeed, feus or grants were originally revocable by the superior, and did not become hereditary till the time of Charlemagne.

Among the ancient Goths and Swedes, the conveyance of land was made in the presence of witnesses, who extended the cloak of the buyer, while the seller threw a clod of the land into it, as a symbol of the transference of possession. Among the Saxons, the delivery of a turf by the seller to the buyer was necessary. Written titles were, however, introduced at an early period, and at first were short and simple in form, but increased in length and complexity as civilization advanced, containing various conditions, provisions, and limitations, so that the art of the conveyancer became both a difficult and laborious one. He had not only to prepare the appropriate form of conveyance, but to examine the prior writings forming the title to the property, in order to judge whether they were in proper form and valid. As a general rule, a written title is now essential to the possession of real property in civilized communities; and if there is no written title, the property falls to the crown or state. In the Roman empire, extending over the greater part of Europe, the system of land-rights was allodial—that is, the lands were held independent of any superior. After the irruption of the northern nations into Italy, the feudal system was introduced, by which the proprietor has only a limited right under a superior. The introduction of the feudal system tended to complicate written titles to land very much, as not only had the rights of the grantee or vassal to be expressed and defined, but those of the granter as over lord or superior, also. In the present century, again, the tendency is towards simplicity; and in France, the feudal system has been superseded by the code Napoleon. In Great Britain and other countries still retaining the feudal system, the forms of C. have been much shortened and simplified. While the feudal system, on the one hand, increased the complexity of C., it ought not to be forgotten that, on the other hand, it greatly lessened the number of conveyances. Under the Roman law, real property descended equally to all the heirs of a deceased proprietor, each heir requiring a written title to his own share; while the genius of the feudal law was to concentrate property in the heads of families, and the eldest son inherited the whole real estate of his ancestor; and alienation, by gift or sale, was long denied to feudal proprietors. Improvement in the science of law occasions improvement in conveyancing. Under the Roman empire, the art of C. had attained to much precision in the hands of the imperial notaries. After the fall of the empire, C. fell into the hands of ecclesiastical notaries; by them it was communi-

cated to the conveyancers of the church, who performed the duties of the conveyancer for some centuries, till after the revival of letters, when the art again passed to laymen.

The feudal system does not seem to have been generally introduced into Great Britain till after the conquest, though traces of it are to be found earlier. The inherent character of the feudal tenure is a grant of land made voluntarily by a king or leader, on the condition of the fidelity of the grantee and military service. While, on the one hand, the superior was a protector to the vassal in time of trouble; on the other hand, the vassal was exposed to the cupidity and rapacity of the superior, whose right to casualties or feudal incidents enabled him to oppress his vassals. The nature of these casualties or incidents will be explained under FINE, QUIT-RENT, HERIOT, COPYHOLD, ESCHEAT, WARDSHIP, MARRIAGE. One of the most curious of these incidents was that last mentioned. A male heir required the consent of his superior, and large fines were exacted for the consent. In the time of Charles I., the earl of Warwick exacted £10,000—equal to a much larger sum now—for his consent to a lady-vassal marrying a husband in every respect suitable.

So long as feudal forms are retained, C. must be complex and expensive. Public opinion has latterly tended unmistakably towards a thorough abolition of the complex and expensive deeds required in the sale and mortgage of land; and the legislature has of late years done much towards this reform. Movable property is usually conveyed by delivery, but there are exceptions; thus, if it has been part of the bargain that the sale has to be completed by writing, the contract must be reduced to writing; and by statute, ships must be conveyed by a writing, which must be entered in the appropriate register, so as to show any change of ownership.

CONVICT (from the Latin) means a person convicted of any criminal charge. The term came by custom to be applied to persons subject to punishment for the more serious class of offenses, and of late its meaning has become almost entirely restricted to the class of criminals who used to be transported to the distant colonies of Britain. These criminals are now condemned to penal servitude for longer or shorter periods, and are usually spoken of as convicts under penal discipline, while offenders sentenced to short periods of detention in the ordinary jails are called prisoners. The convicts are confined in special C. establishments in different parts of the United Kingdom. The earlier history of the treatment of these criminals will be found under the head TRANSPORTATION. In the year 1840, the system of transportation to the chief penal colony, New South Wales, was suspended. Grave doubts had become prevalent as to the efficiency of the system, and all questions created by these doubts were solved by the refusal of the colonies to receive convicts, and the impossibility of disposing of them abroad, except in trifling numbers to the small district of western Australia. It was thus necessary to solve the question how these convicts could be treated at home in a manner consistent with the objects of punishment—the protection of the community, and the reformation of the offender to the extent to which that is practicable. Before this necessity occurred, considerable progress had been made in prison discipline by arrangements which, without subjecting criminals to absolute silence or absolute solitude, separated them from the contaminating society of each other. It was naturally supposed that a system found beneficial for ordinary prisoners would suit convicts. But it was discovered that the discipline beneficially applied during a short period of imprisonment, could not be endured for a long period without physical and mental deterioration; and that the depression and anxiety created by their long sentences—sometimes for twenty years, and sometimes for life—made convicts break down under it within the period for which it could be quite easily endured by ordinary prisoners. It is a fixed principle of prison discipline, that while punishment may be made to any extent disagreeable, it is never to be permitted, if possible, to injure either the body or the mind. It was found unsafe to subject male convicts to separate imprisonment for more than eight months; females, owing to some constitutional difference, are found to bear it without detriment for four months longer. At the end of eight months, then, or a year, as the case may be, the C. is gradually, so far as is consistent with safe custody, brought back into the habits of the freer population. It is usual to call the early stage of their discipline the probationary, and the later the reformatory. In the latter, they are associated under precautions and careful inspection, and are occupied in trades in which they may make their bread when free. Public works, such as the breakwater, quarries, and fortress at Portland, and the works at Chatham and Portsmouth, afford a valuable outlet for C. labor. In such establishments may be seen a thousand men or more, with hammers, mattocks, axes, and all descriptions of formidable tools, working under the eye of their warders as quietly and systematically as ordinary laborers. There are establishments where, as far as possible, the same system is administered to females—as at Woking and the general prison for Scotland at Perth. The great hold by which the convicts are kept in order is the system popularly called "the mark system," under which, by steady application to work, convicts earn a remission of part of their sentence. Conduct is not taken into account in assigning these marks, but on the occasion of any specific misconduct a proportion of earned and registered marks is forfeited. The present C. establishments of the United

Kingdom are: In England—Dartmoor, in which the great proportion are invalids; Portland, Portsmouth, Chatham, and Borstal, for males, in each of which there are public works; Pentonville, Parkhurst, Wormwood Scrubs, and Brixton, for males; Woking and Millbank, for males and females; and Fulham, for females. In Scotland, the C. department of the general prison at Perth is occupied by a limited number of males for the first nine months of their sentence (after which they go to public works prisons in England), and by females for the whole period. In Ireland—Spike island (with forts Camden and Carlyle) and Lusk for males; and Mountjoy for males and females. The number of convicts in England on 31st March, 1877, was—males, 8,843; females, 1251: Scotland (1876), males, 55; females, 234: Ireland (1876), males, 891; females, 263: Western Australia, 350.

CONVOCA'TIONS (from Lat. *convocare*, to call together) were originally synods of the clergy or the ancient ecclesiastical councils of the archbishop, but became incorporated into the English constitution of church and state, and endued with certain parliamentary privileges. Some writers distinguish between councils and C.—the former as being for spiritual purposes, and summoned without authority from the crown; the latter as being for civil purposes, and by command of the crown. The two, however, in process of time, especially after the conquest, became gradually blended; C. made canons, and councils granted subsidies, and all distinction had disappeared before the reformation. The circumstances attending the famous assembly at Northampton, 1282, in the reign of Edward I., helped to settle the form which C. have since assumed. In England, the provinces of Canterbury and York have each their convocation. Previous to the reformation, these were sometimes convened into a *national* synod; but since then, matters have usually been concluded in the C. of Canterbury, and transmitted to York for concurrence. A convocation consists of three elements—1. The archbishop; 2. The bishops; 3. The clergy of the second order. They originally met in one assembly, but since the beginning of the 14th c. the clergy in the province of Canterbury have retired into a distinct chamber, presided over by a *prolocutor*, with officers and journals of their own. These two bodies are called the upper and lower houses. In the convocation of York the same distinction exists, but on the rare occasions of their meeting, the business has been generally conducted in one assembly. The archbishop has the sole power of summoning, presiding, and proroguing; he has also a veto upon all measures. He cannot, however, summon without authority from the crown. The upper house is the proper *locus synodi*, where the bishops have a right to sit and vote, and before the reformation the mitred abbots had place there also. The lower house consists of the lesser dignitaries, as deans and archdeacons, and the proctors sent by capitular bodies and by the parochial clergy. In Canterbury, the beneficed clergy only elect, and they send one proctor for each diocese; in York, all the clergy elect, and send one proctor for each archdeaconry. The lower house deliberates on matters proposed to the archbishop; it may present petitions to the upper house and state grievances, be with it in judicature on persons convened, and dissent from and so hinder the passing of any synodical act. The passing of subsidies in convocation ceased in 1665, and the records were destroyed in the fire of London in the following year. Meetings of convocation fell into abeyance from the political troubles caused by the revolution of 1688. They have been revived with considerable advantage to the church, but their action has been and is greatly restricted. In Ireland, the C. of the four provinces assembled at Dublin, all together, and were on the model of those in England. At the union, no provision was made with respect to this matter, and since then there has not been even a formal assembling of the Irish convocation. An act of parliament was passed in 1663, for regulating the meetings of convocation in Scotland; but shortly after the revolution of 1688, the Episcopal church ceased to be the national church of that country; and ever since, the meetings of the Presbyterian church, embracing clergy and laity, have been called general assemblies. See ASSEMBLY, SYNOD.

The position of the church of England as respects its C. is exceedingly anomalous, but is incidental to certain circumstances in the constitution and polity of the country. As essentially interwoven with the state, the church possesses no independent action; its articles, liturgy, organization as to benefices, etc., are all regulated by parliament; while its discipline falls within the scope of the ecclesiastical courts, a class of tribunals apart from the ministering clergy. The church, therefore, in its capacity as an institution to teach certain doctrines of religion, is left little to do in the way of jurisdiction. It is further urged, as a reason for restricting the power of convocation, that being purely sacerdotal, it might be apt to run into excesses, and put forth claims adverse to the prevailing tone of sentiment on religious matters; that, in short, as things stand, it is safer for the public to be under the authority of parliament than to be subject to the ordinances of a body of ecclesiastics. At the same time, it is generally allowed that some kind of reform is desirable, though how this should be effected in a manner satisfactory to all parties, it would be difficult to say. The convocations of Canterbury and York assemble annually at the opening of parliament, each keeping up its own distinctive customs. See Trevor's *Convocations of the Two Provinces;* Cardwell's *Synodalia*, and *Documentary Annals;* Lathbury's *History of the Convocation of the Church of England.*

CONVOL'VULUS (Lat. *convolvo*, to twine together), a genus of plants, the type of the exogenous natural order CONVOLVULACEÆ. This order contains nearly 700 known species, herbaceous and shrubby; generally with a twining stem and milky juice; large and beautiful flowers; a 5-partite calyx; a monopetalous corolla, with regular 5-lobed and plaited limb; five stamens; the ovary free, with 1 to 4 cells and few ovules; the fruit a capsule, sometimes succulent. The plants of this order are very abundant in the tropics, but comparatively rare in cold climates. Many are cultivated as ornamental plants, particularly species of *convolvulus* and *ipomœa*. The acrid milky juice is often strongly purgative; and jalap and scammony are products of this order. Some species, however, have large farinaceous roots, capable of being used as food, of which the batatas (q.v.), or sweet potato, is the most important. A few are natives of Britain, and are known by the name of BINDWEED. *C. arvensis* is atrouble some weed in some sandy soils in England, and *calystegia sepium* in richer soils. The former has rose-colored fragrant flowers, the latter large white flowers. Both are ornamental; the latter is now often planted to cover posts and trellises. *C. scammonia* yields scammony, and the root of *C. panduratus* is used as a purgative in the United States. *C. scoparius*, a shrubby species, native of the Canary isles, yields one of the kinds of wood called rosewood, which has a strong smell of roses.

CONVOY (Fr. *convoi*) is the name given to one or more ships of war appointed to protect a fleet of merchant vessels against the attacks of an enemy or of pirates. If a merchant ship part company with the C., or neglect to obey the signals, all claims of insurance are forfeited. The name is sometimes applied to the merchant vessels so escorted. In the military service, a C. is, properly speaking, a train of wagons laden with provisions or warlike stores; the term, however, is applied also to the detachment of troops, or escort, appointed to protect such a train.

CONVUL'SIONARIES, the name given to a fanatical sect of Jansenists who sprang up in France about 1730. Their meeting-place was the church-yard of St. Medardus, in a suburb of Paris, where was the tomb of a certain Francis of Paris, who died in 1727, and was reckoned very holy by the Jansenists on account of his extravagant asceticism. At this tomb a multitude of people poured forth fanatical prayers, preachments, and prophesyings. Miracles are also alleged to have been performed, for proof of which we are referred to a work written by M. Montgeron, a French senator, and entitled *La Verité des Miracles opérés par l'intercession de François de Paris* (Paris, 1737). After 1731, the fanaticism of the C. increased to utter madness. "They threw themselves into the most violent contortions of body, rolled about on the ground, imitated birds, beasts, and fishes, and at last, when they had completely spent themselves, went off in a swoon." In 1733, the king issued an order for the imprisonment of these fanatics, but it was found impossible to put a complete stop to the mischief. They took to predicting the downfall of the throne and the church, which prophecy the French revolution appeared to fulfill. They were not much heard of in Paris after the middle of last century, but have occurred in country-places at various times within the present century. They brought Jansenism into so much disrepute, that Voltaire declared the tomb of Francis to be the grave of Jansenism.

CONVULSIONS, a form of disease very frequently affecting infancy, in which the body is thrown into violent spasmodic contractions, the sensibility and voluntary motion being for a time suspended. A fit of C. may last from a few minutes to some hours, and may readily prove fatal, if not relieved within a short period. The first symptom observed is often a twitching of particular muscles or groups of muscles, and a change in the habitual expression or color of the face, with distension of the features, and turning of the globes of the eyes suddenly upwards. The fingers are sometimes clenched in the palm, and the feet turned inwards; sometimes, however, C. occur absolutely without warnings of this kind, and even in the midst of perfect apparent health. Their cause is usually to be found in some source of irritation, capable of producing fever if long continued; as, for instance, disordered dentition, worms in the intestine, hooping-cough, etc. Most epidemic fevers are also apt to be attended, in children, by C. in their early stages; and diseases of the brain and its membranes at every stage of their progress. C. are greatly promoted by bad ventilation and injudicious feeding, with deficient exercise; and a great part of the cure consists in discovering and removing the causes of the disease.

When a child is suddenly seized with C., or with a tendency to spasm, such as twitching of the features, or contractions of the fingers and toes, it should be placed at once in a very free current of air, with its feet towards the fire; the extremities should be kept warm, and a cold lotion may be applied to the head, especially if there is much flushing of the face; a little castor oil may be given if the bowels are confined; and if there is flatulence, the belly may be rubbed with a warm hand, or with some simple stimulating liniment, such as camphorated oil. Not much more can be done without medical assistance; but in the event of the case being very serious, and medical aid at a great distance, it might perhaps be right to cause the child to inhale a little chloroform, great care being taken that plenty of air is also admitted to the lungs. The strictly medical treatment commonly consists in the administration of medicines

adapted to the state of the bowels, with the application of cold to the head, and sometimes the inhalation of chloroform. Leeches and bleeding are very rarely useful, though too often employed.

C. are rare amongst horses and cattle. In young dogs, however, they frequently occur from intestinal worms, disordered digestion, or in connection with distemper or other debilitating diseases: they usually disappear when their special causes are removed.

CONWAY, a river in North Wales, 30 m. long—one of the most noted in Wales for the bold romantic scenery along its higher, as well as the rich beautiful scenery along its lower course. It rises in a small mountain lake where the three counties, Merioneth, Denbigh, and Caernarvon meet, and runs n.w., n.e., and n., past Llanrwst, Trefrhiw, and Conway, to Beaumaris bay in the Irish sea. It receives many rapid mountain streams. In the lower 12 m. of its course it is a large, winding, smooth stream, up which the tide flows, and is navigable for vessels of 100 tons. At Conway it is half a mile broad at spring-tides, which rise here 21 to 24 feet. The C. has been famous for its pearls since Roman times.

CONWAY, a co. in central Arkansas on the Arkansas river, and intersected by the Little Rock and Fort Smith railroad; 1200 sq.m.; pop. '80, 12,754—3,209 colored. The surface is diversified and the soil is fertile, producing corn, cotton, tobacco, etc. Co. seat, Lewisburg.

CONWAY, a t. in Carroll co., N. H., on the Saco river, 55 m. n.n.e. of Concord; pop. '80, 2,092. The village of North Conway is famed for beautiful scenery, and is a favorite place for artists, as well as a popular summer resort. On the e. is a range of hills, and a little to the n. is Mt. Kearsarge, 3,367 ft. above tide. On the w. are other peaks, and up the valley of the river Mt. Washington is in view.

CONWAY, or ABERCONWAY, a seaport t. of Caernarvonshire, North Wales, on the estuary of the Conway, here crossed by a fine tubular, and a suspension bridge, 22 m. n.e. of Caernarvon. The town, which is triangular in form, is beautifully situated on a steep slope on the left bank of the Conway, and is surrounded by walls 12 ft. thick, with towers and battlements. The principal streets are well proportioned and regular, and contain several ancient houses. C. castle, one of the noblest castellated structures in Britain, stands on a precipice overlooking the river. It was first built by Hugh Lupus, earl of Chester, and rebuilt in 1283 by Edward I., to check the Welsh. Its walls are 12 to 15 ft. thick, with eight vast towers, four of which are each surmounted by a slender turret. In 1646, the parliamentary forces took the castle, but did not injure it; but after the restoration it was dismantled by the earl of Conway. The Plâs Mawr, "Great Mansion," is a noble pile erected in 1585, in the Elizabethan style, with the exterior and interior profusely ornamented with figures, coats of arms, scrolls, etc. The harbor is dry at low-water. C. was an opulent town until the great plague in 1607 almost depopulated it. A Cistercian abbey was founded here by Llywelyn ab Jorwerth, prince of North Wales. Llywelyn the great, and several other princes and illustrious persons, were buried in it. The castle hotel at present occupies its site. Pop. '71, 2,620. C. unites with Caernarvon, Bangor, Criccieth, Nevin, and Pwllheli in in returning one member to parliament.

CONWAY, HENRY SEYMOUR, 1720–95; a British general who had a command in Germany in 1761, and was secretary of state in the English cabinet in 1765. In 1782, he was appointed commander-in-chief.

CONWAY, MONCURE DANIEL, b. Va., 1832; graduated at Dickinson college, 1849; began to study law but gave it up and joined the Methodist ministry. He preached in various towns in Maryland, and wrote for a Richmond paper, being then a cordial supporter of extreme southern opinions. His views, however, experienced a change; he left the Methodist church, and entered the divinity school at Cambridge, where he graduated in 1854. Returning to Virginia, he was driven from the state on account of his political opinions. He then became pastor of a Unitarian church in Washington. From this he was dismissed because of his opinions on slavery, and he went to Cincinnati. He lectured in Ohio and in the New England states on the slavery question. In 1863, he visited England, where he lectured and wrote on the war and its effect on slavery. For several years thereafter he labored as a minister in London. Among Conway's publications are *Tracts for To-Day; The Rejected Stone; The Golden Hour; The Earthward Pilgrimage; Republican Superstitions*, etc.

CONWAY, THOMAS, 1733–1800; an officer in the American revolution, a native of Ireland, educated in France, and came to America in 1777. He was appointed brig.gen., and took part in the battles of Brandywine and Germantown. Against the protest of Washington, Conway was made inspector-general, in which position he was prominent in the intrigue by which Gates was to be put in Washington's place. In 1778, he resigned, and in the same year he fought a duel with gen. Cadwallader. In 1784, he returned to France, and was appointed governor of Pondicherry and the French East India settlements. When the French revolution came, he was compelled to fly and his life was saved only by the interposition of English authority.

CONY, an old English name for the rabbit, but employed in the authorized and other versions of the Bible as the translation of a Hebrew word which certainly does not designate the rabbit. The C. of the Old Testament is with the greatest probability supposed to be the daman (q.v.) or ashkoko.

CON'YBEARE, HENRY, son of William Daniel, b. 1823; an English engineer having charge of important works in India. He designed the docks for the port of Bombay. Of late years, he has had charge of engineering works in England.

CON'YBEARE, JOHN, 1692–1755; an English divine, a graduate of Oxford, ordained in 1716. He subsequently became a tutor in the college and was appointed one of the preachers to the king at Whitehall. In 1730, he was chosen master of Exeter college. He had previously attracted notice by the publication of two sermons on *Miracles*, and on the *Mysteries of the Christian Religion;* and in 1732, he published his great work, *A Defense of Revealed Religion*, a reply to Matthew Tindale's *Christianity as Old as the Creation*, which appeared two years before. Conybeare was appointed dean of Christ church, Oxford, and finally bishop of Bristol.

CON'YBEARE, JOHN JOSIAS, 1779–1824; grandson of the bishop of Bristol; professor of the Anglo-Saxon language and of poetry in the university of Oxford. He made valuable contributions to the annals of philosophy and science, and published *Illustrations of Anglo-Saxon Poetry.*

CON'YBEARE, WILLIAM DANIEL, 1787–1857. He was educated at Oxford, and was one of the earliest and most efficient members of the geological society. In 1821, he discovered and described the first plesiosaurus, thereby opening the road in which important discoveries were afterwards made by Owen and others. He was made dean of Llandaff, and was a fellow of the royal society. In 1836, he published a course of theological lectures. His principal work was *Outlines of the Geology of England and Wales.*

CON'YBEARE, WILLIAM JOHN, d. 1857; son of William Daniel, and an English clergyman and writer of essays. He wrote *Perversion, or the Causes and Consequences of Infidelity* (a religious novel), and with Rev. J. S. Howson wrote the *Life and Epistles of St. Paul.* His essays and sermons were collected and published.

CONY'ZA, a genus of plants of the natural order *compositæ*, sub-order *corymbiferæ*, of which one species, *C. squarrosa* (also known as *inula conyza*), is of frequent occurrence in England and throughout great part of Europe. It has a stem 2 or 3 ft. high, downy ovato-lanceolate leaves, and yellow flowers. It receives the English names fleabane and plowman's spikenard, and has a strong peculiar smell, which is said to drive away fleas and gnats. In most of the languages of Europe, it bears names referring to this property.

COOK, a co. in n.e. Illinois, bordering on Indiana and lake Michigan, intersected by the Illinois and Michigan canal, and by the numerous railroads centering at Chicago; 1027 sq.m.; pop. '80, 607,468. The surface is level and the soil rich, producing wheat, corn, oats, barley, potatoes, hay, wool, and vast quantities of milk and butter for the Chicago local market. Co. seat, Chicago.

COOK, a co. in n. Texas bordering on the Indian territory, drained by the tributaries of Trinity river; 900 sq.m.; pop. '80, 20,391—830 colored. Its surface is prairie and forest, with rich bottom-lands along the streams. Chief productions, corn, oats, cotton, and butter. Co. seat, Gainesville.

COOK, CHARLES, D.D., 1787–1858; an English clergyman, appointed in 1818 to the French mission of the Methodist church in Normandy. It was mainly by his exertions that Methodism was established in France.

COOK, CLARENCE CHATHAM, b. Mass., 1828; graduate of Harvard. He studied architecture, and passed several years in teaching. In 1863, he wrote for the *N. Y. Tribune* a series of articles on American art, and in 1869 he was a correspondent of that journal in Europe. He has made a specialty of art criticism. He has published *The Central Park*, and many articles on his favorite themes.

COOK, ELIZA, b. 1817; an English writer of poetry and essays. Her first book was *Melaia, and Other Poems.* In 1849, she became editor of *Eliza Cook's Journal*, a weekly publication intended to inform and elevate the people. In 1864, she published *New Echoes;* and she is the author of several other works.

COOK, Captain JAMES, one of the most eminent among England's celebrated navigators, was b. Oct. 27, 1728, at Marton, in Yorkshire, where his father was an agricultural laborer. At first apprenticed to a haberdasher, he afterwards went to sea, and, having spent some years in coasting-vessels, entered the royal navy, in which he soon rose to the rank of master. The charts and observations which he drew up as marine-surveyor of the coasts of Newfoundland and Labrador, introduced him to the notice of the royal society, who offered him the command of an expedition to the Pacific ocean, to make an observation of the transit of Venus over the face of the sun. The voyage being one to his taste, C. immediately accepted the offer, and set sail from Plymouth on the 26th

of Aug., 1768, in the *Endeavor*, a small ship of 370 tons. The expedition arrived at Tahiti (or Otaheite, as he named it) on the 13th April of the following year; and the transit was witnessed in a most satisfactory manner on the 3d June. Leaving Tahiti on the 13th July, C. visited New Zealand, which had not been touched at by Europeans for a century and a quarter; and after exploring the coast for six months, sailed westward, reaching (on the 19th April, 1770) New Holland, now Australia, which he called New South Wales, and took possession of in the name of Great Britain. Having explored a large portion of the coast, he steered for New Guinea, passing between Australia and that island, and thus proving, what had heretofore been doubted, that the two were distinct islands. Continuing his voyage by Java, Batavia, and the cape of Good Hope, C. anchored in the Downs on 12th June, 1771. This voyage, besides vastly increasing geographical knowledge—one of the important results in this respect being, that it proved that neither Australia nor New Zealand belonged to the southern continent at this time supposed to exist, and that to the northward of lat. 40° s. no continent could exist—also added not a little to the sciences of botany and astronomy. A second voyage, for the discovery of what was then called the *Terra Australis Incognita*, which was now believed to lie in higher latitudes than had hitherto been explored, was undertaken by C. in the year of his return; and the expedition, consisting of two ships—the *Resolution* and the *Adventure*—sailed from Plymouth on the 13th July, 1772. It would be out of the scope of this article to follow capt. C. through his three years' navigation of the Pacific and Southern oceans, in the course of which time he sailed upwards of 20,000 leagues. It can only be stated generally, that his voyage proved the non-existence of land of any extent between the 50th and 70th parallels. C. arrived in England again on the 30th July, 1775. So admirable had been his arrangements for the health of his crew, that during the whole voyage he lost only one man by sickness; and so skillful his seamanship, that not a spar of any consequence was lost. C. wrote an account of his second voyage himself. The belief in a practicable n.w. passage, notwithstanding the failure of attempts extending over two centuries, still held possession of men's minds; and C. had no sooner returned from his second voyage, than he offered his services to the admiralty, who had resolved on another effort for the discovery. They were gladly accepted, and C. determined to seek the passage by the way of Behring's strait, instead of by Baffin's bay and Davis' strait, the routes formerly attempted. In his old ship, the *Resolution*, accompanied by capt. Clerke in the *Discovery*, C. sailed from Plymouth on the 12th July, 1776. In this last voyage, C. met his death at the hands of savages, on the island of Hawaii, while endeavoring to recover a boat which had been stolen from the *Discovery*. This tragical event occurred on the 14th Feb., 1779; not, however, before C. had made valuable additions to our geographical knowledge of the coasts of America and Asia, in the region of Behring's strait. The news of his death occasioned deep and general regret in England. The king granted his widow a pension of £200, and each of his children £25; while the royal society did honor to his name, by having a gold medal struck in his commemoration. C. was one of England's greatest navigators. A practical and scientific seaman, he was also a sagacious, self-possessed commander, kind although strict to his crew, and marked by indomitable perseverance and ready decision.

COOK, ZEBEDEE, 1789–1858; b. Mass., one of the earliest in introducing to this country the system of mutual insurance, and president of the first company in New York in that business. He was also interested in agricultural pursuits, and was one of the founders of the horticultural society of Massachusetts. He was also instrumental in founding the beautiful cemetery of Mt. Auburn, near Boston, the first burial-place of the kind in the country.

COOKE, AMOS STARR, 1810–71; a native of Connecticut, and graduate of Yale. He entered the Congregational ministry, and was sent as missionary to the Sandwich islands in 1837, where he took charge of the education of the royal family, continuing in the service for 12 years.

COOKE, EDWARD, D.D., b. 1812; a native of New Hampshire, and graduate of Middletown college; teacher of natural sciences in Amenia seminary, N. Y., and principal of a seminary in Pennington, N. J. He was minister in several Methodist churches in Boston, and was for a time the principal of Lawrence university, Appleton, Wis. In 1864, he was chosen president of the Wesleyan academy at Wilbraham, Mass.

COOKE, GEORGE FREDERICK, 1755–1812; an English tragedian, and one of the first of high rank to visit the United States, appearing at the Park theater, New York, in 1810, as "Richard III." He played in all the large cities, but his social habits often interfered with his business, and hastened his death. He was buried in St. Paul's churchyard, New York, and his greater successor, Edmund Kean, built a monument over his grave.

COOKE, JAY, b. Ohio, 1821; for a time one of the leading financiers of the country. He began as clerk in a Philadelphia banking-house, where he soon became a partner. About the time the rebellion broke out, he was at the head of the house of Jay Cooke & Co., and had more than any other man to do with the negotiation of government loans. The firm suspended in 1873, and its failure was one of the principal causes of the financial panic of that year.

COOKE, JOHN ESTEN, b. 1830 in Virginia. He studied law, and was admitted to the bar, but his attention was devoted almost exclusively to literature in the line of novels and poems. Among his publications are *Leather Stocking and Silk; The Youth of Jefferson; The Virginia Comedians; Ellie, or the Human Comedy; The Last of the Foresters; Henry St. John, Gentleman; Life of Stonewall Jackson; Wearing of the Grey;* and other works relating to the war of secession. His later publications are *Doctor Van Dyke*, and *Her Majesty the Queen.*

COOKE, JOHN RODGERS, 1788–1854; a native of Bermuda, and a distinguished jurist in Virginia, where for nearly half a century he held a prominent position. He was a member of the legislature, and of the convention for framing the constitution of the state.

COOKE, PHILIP ST. GEORGE, b. Va., 1807; graduated at West Point academy in 1827, and served in the army as a dragoon officer. He served through the war of the rebellion, rising to brevet-brig.gen., and retiring from active service in 1873. In 1856, he published *Scenes and Adventures in the Army.*

COOKERY. To prepare and soften food by the action of fire, and so to render it fit for digestion by the human stomach, has been a general custom from remote times; and more or less of skill in accomplishing this primary end has been displayed, according to the knowledge, wealth, and refinement possessed by each nation or people.

In ancient times, the occasion of a banquet appears chiefly to have arisen in a sacrifice to the gods, when a part of the victim was brought to the dwelling of the sacrificer, and was cooked for the feast. Birthdays, funerals, and victories were also celebrated in this manner. "The Persians," says Herodotus, "were accustomed to honor, above all others, that day on which they were born, when the rich among them would sacrifice an ox, a horse, or a camel, which they roasted whole in ovens, while the poorer class gave only the smaller animals, as sheep. Yet the Persians were not great eaters of meat, but consumed much sweet food, and did not use salt." The appendages to the higher order of banquets were most magnificent, so that in point of quantity and display they were very expensive. Herodotus says on this head, "that the Greeks who invited Xerxes to supper, all came to the extremity of ruin; and that, wherever he took two meals, dining as well as supping, that city was utterly ruined.

The Egyptians, it is said, were great bread-eaters. Though they possessed wheaten flour of the finest sort, they do not appear to have used it for their common bread, which was made of spelt, or of the center of the lotus dried and pounded. Fish they salted and dried in the sun; quails, ducks, and small birds they salted and ate raw. We read of their roasting and boiling the flesh of the ox. Large flocks of geese and of fowls were kept by them for the use of the table, hence their plan for the artificial hatching of eggs. "Fish was used by all classes except the priests, but the staple food of the people consisted of vegetables, of which they had a large supply." Herodotus mentions their making beer from barley, which they called *lythus.* We may still see the form in which their food came to table; ducks, loaves made round, and some biscuits and cakes, which have been taken from Egyptian tombs, are to be found in the British museum. Apollonius, who wrote a treatise on the feasts of the Egyptians, says that they ate in a sitting posture, using the very simplest and most wholesome food.

There appears to have been considerable difference as to the manner in which good eating was appreciated in different parts of Greece. The Athenian meals are ridiculed by the comedians for their parsimony. After the Homeric age of simplicity, in which roast and boiled meat seems to have sufficed the kingly table, a diversity of preparation was obtained in cooking, and a certain epicureanism displayed in the quality, seasoning, and method of dressing food. The names of many authors of C. books are preserved in the writings of Athenæus; that of Archestratus, who is called the guide of Epicurus in his pleasures, and styled the inventor of made dishes, being the most renowned.

Fish was a principal article of food with all classes of Greeks; but with the wealthier, much skill and delicacy were used in cooking it, and choice and expensive sorts were sought after. Archestratus writes of "a boiled torpedo done in oil and wine, and fragrant herbs, and some thin grated cheese." Fish, stuffed with force-meat and fried, boiled in pickle, baked in fig-leaves soaked in oil, cooked in hot ashes, etc., are among the recipes we find recorded. Large quantities of salt-fish were brought from the shores of the Euxine and the Hellespont; and this, with meal, cheese, and onions, was the chief food of the armies and navies when on service. The Greeks boiled and roasted the flesh of sheep, pigs, lambs, and goats. They had poultry, small birds, and game, and sausages made of blood, partaking of the character of black-puddings. The bread made at Athens was the most celebrated; it was sometimes household, but chiefly bought in the market, and was made in great variety, as pan-loaves, rolls, sweet loaves, etc. The bread eaten by the poorer classes was made of barley, and sometimes flavored with oil, honey, poppy-seed, etc. Athenian cheese-cakes were also famous; and they had honey and sesame-cakes, which, with fresh and dried fruits, as figs, almonds, olives, and nuts, seem to have been partaken of after dinner. They consumed vegetable food also in abundance, and had cabbage, onions, lettuce, and so on.

In the Greek house there was no regular cook, though in the establishments of the wealthy several females were kept, to attend to the kitchen. The women, in general, saw to the requirements of the table, and even the lady of the house was not idle. Cooks

stood in the market at Athens, ready to be hired for particular occasions; the most celebrated were those of Sicily; they were probably persons of some importance.

"To roast some beef, to carve a joint with neatness,
To boil up sauces, and to blow the fire,
Is anybody's task; he who does this
Is but a seasoner and broth-maker;
A cook is quite another thing. His mind
Must comprehend all facts and circumstances.
Where is the place, and what the time of supper;
Who are the guests, and who the entertainer;
What fish he ought to buy, and where to buy it."
Quoted by Athenæus from Dionysius, a comic poet.

In the early days of Rome, a gruel made of barley, and called *puls*, was the principal food of the people, and with green and other vegetables was, till later times, the usual fare of the inferior classes—meat being used but sparingly. By degrees, however, a taste for better eating crept in; and after the Asiatic conquests luxury was imported. Lucullus introduced habits of epicureanism after his return from Asia; the gourmand Apicius earned for himself a deathless name. The wealthy Romans cared for the elegant serving of their table, as well as for the quality of viands placed before them. With them, as with the Greeks, fish was a necessary as well as a luxury: they took much trouble to procure their oysters, and gave large sums for other fish. We read of a mullet of 6 lbs. sold for 8,000 sesterces (£70 16*s.* 8*d.*), and of the rhombus or turbot from Ravenna being held in high estimation. They seem to have been as clever as the French in preparing *surprises*, and in carrying out *disguises* in their dishes. The *pistor*, who made the bread and pastry, and the *structor*, who composed artificial figures of fruit or flesh, and who also arranged the dishes, seem to have shared the duties of the cook. We read of dainties, as ring-doves and fieldfares, hares, capons, ducks, peacocks, pheasants, and the livers of geese: also of such a formidable *pièce de résistance* as a "huge boar, surrounded with sucking pigs made in sweet paste, which were distributed among the guests." The Romans prepared and cooked their food with oil to a great extent. Their meals probably consisted of two courses and a dessert, the first course being of materials intended to sharpen the appetite, and the second the "brunt of war," that is, a joint roasted or baked. The discovery or cultivation of vegetables, perhaps, gave rise to some proper names, as Lentullus, Fabius, etc. It is a Roman saying that the number of persons at a repast should not be less than that of the graces, nor more than that of the muses. The Greeks and Romans used honey for the purposes for which we use sugar. The sugar-cane probably was cultivated in China, and its manufacture understood there; but the Greeks took it for a kind of concrete honey, and used it only for medicinal purposes.

Of ancient British C., nothing is known; it was probably of an extremely rude description. Hares, poultry, and fish are said to have been forbidden as food. We do not find much mention of the art of C. in the Saxon chronicles. The Danes and Germans appear to have been great drinkers, and to have paid little attention to the preparation of their eatables. The Normans were more curious in these matters; some offices among them were held in right of the kitchen. In early English C. much use was made of the mortar. Oil and lard were used instead of butter. Several English C. books bear an early date, as *The Forme of Cury*, by Mr. Pegge, 1390; and others date as follows: Sir J. Elliott's book, 1539; Abraham Veale's, 1575; *The Widdowe's Treasure*, 1625.

The C. of France was probably of an imperfect and rude kind, till the introduction of Italian tastes by the princesses of the house of Medici. The ancient use of oil was modified by the discovery made by the French, of dressing meat in its own gravy. In our own day, there is no denying that the French cook is a true artist. We may, if we please, impute the trouble he takes with the dressing of his meat to the inferiority of the material, but this can be said of meat only; the preparation of vegetables and fruits is attended to with equal care, although, probably, the French have some of these things in greater perfection than ourselves. The great difference between French and English C. consists in the fact, that they cook their meat much longer than we do. They consider that this renders it more digestible. They are thereby enabled to multiply dishes by altering or annihilating the original taste of the meat, and making it a vehicle for foreign flavors. The variety, daintiness, and grace of form which dishes thus acquire, is advantageously made use of by us, when we admit them at our repasts to mingle with our heavier and radically English joints. But, for ourselves, we desiderate the integrity of the form and flavor of our meats, considering that to be *over-cooking* which the French think only sufficient. In the point of economy, the French have a decided superiority over us. The French cook throws nothing away. Instead of going to the butcher for meat for stock, as our English cook does, he uses the trimmings for stock and glaze, and the skimmings of his boiled meats for purposes to which we apply butter or lard; and like a true workman, he produces great results from small means. This requires an education which few mistresses demand and few cooks obtain, but which, when achieved, justifies the expression of Voltaire:

Qu'un cuisinier est un mortel divin!

The estimation in which the services of a cook are held, may be known by the large salary attached to the office in great families, hotels, and club-houses. A visit to the kitchens of one of these establishments will teach us what a highly important post is that of *chef de cuisine*. There must be in such a person not only the necessary knowledge how things are to be done, but the power to arrange and direct the work of the numerous assistants, as to the exact part they must fulfill at each moment of their long and busy day. These places, indeed, are excellent schools for cooks, where they can undergo that severe training, without which a thorough practical knowledge of the business cannot be attained. It is indeed to be regretted—because a source of so much disappointment, discomfort, and waste—that a knowledge of plain C., at least, is not more desired by mistresses for themselves. That acquirement, and household management generally, are important enough to be made part of the education of all classes. The poorer would thereby be enabled both to lay out their money profitably, and to prepare their food so that it might satisfy and nourish them; and the heads of establishments in the upper classes would be more in a position to direct, appreciate, or, if necessary, condemn the performance of the cook. A cultivated and elegant taste is as much shown in the arrangement of viands as in the furnishing and decoration of the choicest boudoir.

The art of C., as a branch of female education, has latterly engaged considerable attention in England; and there are in London, Edinburgh, and other places, establishments where young ladies receive this kind of instruction. Recently, a school of cookery has been attached to the South Kensington museum. Efforts are also made to teach C. to the humbler classes of girls, but much in this respect remains to be done. For any shortcomings in cooking, however, the taste of the English is in some measure accountable. The universal practice of roasting large pieces of meat, which cannot be consumed while hot, causes no little waste, and is obstructive of improvement. The Scotch—who derive some part of their C., along with other usages, from the French—deal more in soup and boiled meat than the English, and their processes, while not less savory, are perhaps more economical.

So numerous are the books on C., that it would be out of our power to name even all the excellent ones. We can only say that Miss Acton's *Cookery Book*, Webster and Parkes' *Encyclopædia of Domestic Economy*, Soyer's work, and that of Francatelli, cook at the reform club, are all good; *Meg Dods's Cookery* is also excellent. For cheapness and simplicity, we may refer to Chambers's *Cookery for Young Housewives* (1s.). The two last mentioned embrace Scotch along with English cookery. See FOOD, BOILING, ROASTING, etc.

COOKERY, ARMY, is now becoming an important feature in the English military system. The sufferings in the Crimea in the winter of 1854–55 drew public attention to the subject; it was then found that C. was little understood by the British troops, and that the soldiers seldom had meat otherwise than boiled. M. Soyer was sent out by the government, principally to advise in reference to hospital C., but also to improve the system of camp C., so far as military routine would allow. He devised new forms of stoves, and constructed recipes for using to the best advantage all the available provisions for a camp. The officers at Sebastopol made a highly favorable report of Soyer's *field-kitchen*, a kind of camp stove, with a caldron holding 12½ gallons. two such stoves would easily cook for a company of 100 men; both could be carried by one mule, with sufficient dry wood for 3 days' fuel. Though mainly intended for boiling, the apparatus afforded facilities for many varieties of cooking. When M. Soyer returned to England, he made a few improvements; and finally the apparatus presented itself as a sort of upright can, suitable for boiling, steaming, baking, roasting, stewing, and making tea or coffee: with 14 lbs. of fuel, one of these would cook for 50 men; and if 20 such were placed near together, 4 cooks could serve for 1000 men.

A committee which inquired on the subject of barrack economy some years ago, recommended that every large barrack should have a bakery with two ovens, where the men could learn to make and bake their own bread; and that the barrack-kitchens should be so furnished as to enable the men to bake their meat if so inclined, instead of being confined, as heretofore, almost wholly to boiled dinners. A school of C. has been formed at Aldershot, where men are trained to act as sergeant-cooks, of whom there is now one to each regiment. His duty is to superintend and direct the operations of the soldiers detailed from the several companies to act as cooks.

At various times in 1859 and 1860, certain highly ingenious forms of apparatus were tried, to test the possibility of cooking for troops while *the kitchen itself is on the march*. One of these inventions consists of a compact set of stoves and caldrons, fitted into a wagon, and has been found on trial to answer the purpose perfectly.

COOK ISLANDS, otherwise known as the Harvey archipelago, were visited rather than discovered by the navigator whose name they bear, during his first voyage. They lie about midway between the Society and Navigator groups, near lat. 22° s. and long. 158° west. The principal members of the cluster are Mangeia, Atiou, Harvey, and Raratonga. The natives, estimated at about 15,000, have been generally converted to Christianity; Raratonga, in particular, being one of the most successful missions in Polynesia.

COOKMAN, GEORGE G., 1800–41; a native of England, and a Methodist preacher in the United States. In 1838, he was chosen chaplain to congress. He was one of the passengers on the steamship *President*, which sailed from New York for England, Mar. 11, 1841, and was never afterwards heard from.

COOK'S INLET, one of the many gulfs of the Pacific ocean on the n.w. coast of America, lies between Prince William's sound on the e. and Bristol bay on the w., in lat. 58° to 61° n., long. 151° to 154° west. It was explored in 1778 by the navigator whose name it bears, in the vain hope of its leading him into the Arctic sea.

COOK'S STRAIT, discovered by capt. Cook on his first voyage, separates the n. and middle islands of the New Zealand group. The proof of its existence dissipated the popular belief that New Zealand, as previously known, was merely a salient point of a great southern continent.

COOKSTOWN, a t. in the n.e. of the co. of Tyrone, Ireland, on the left bank of the Ballinderry, 23 miles e.n.e. of Omagh. It consists of one very long and broad street, with a row of trees on each side. It has a linen trade. Pop. '71, 3,501.

COOLERS, or CONTRIVANCES FOR COOLING, are resorted to by the brewer, and by the distiller of alcohol and other liquids. See BEER and DISTILLATION. They are also used in warm weather for the cooling of water (q.v.).

COOLEY, THOMAS MCINTYRE, b. N. Y., 1824. In 1843, he settled in Michigan and was admitted to the bar. He compiled and published the laws of the state, and in 1858 was made reporter of the supreme court. When the law department of Michigan university was established he was chosen one of the professors. In 1864, he was elected judge of the supreme court, and in 1868 chief-justice. His most important publication is *The Constitutional Limits which rest upon the Legislative Power of the States of the American Union.* He is the author also of valuable articles in reviews, etc.

COOLIES, or COULIES, originally the name of one of the aboriginal or hill tribes of Hindustan. From the circumstance that many of this tribe are employed as laborers and porters in Bombay and other places, the name is applied by Europeans in Hindustan to porters in general; and it is now used to denote emigrant laborers from India and China to tropical and other countries. The importation of this useful class of laborers to the Mauritius, West Indies, and British settlements on the mainland of South America, has grown up as a result of negro emancipation—the emancipated slaves showing an indisposition to become regular laborers. Hence the necessity for resorting to imported labor from India or China.

Much difference of opinion prevails as to the propriety of coolie immigration. It is one of those vexed questions on which something can be said on both sides. We would refer to Mr. A. Trollope's *West Indies and Spanish Main* (1860), for some general observations on the introduction of C. to certain British West India settlements. A later work by Mr. Jenkins, *The Coolie, his Rights and Wrongs* (1871), though relating exclusively to British Guiana, is full of most interesting matter. The conclusion at which he arrives regarding the system is thus expressed: "Taking a fair review of the whole system, it is one which, spite of its disabilities, its difficulties, its present evils, is full of promise, and, in my belief, can be made, with care, and skill, and honest endeavor, not only an organization of labor as successful as any hitherto attempted, but one leading to almost colossal benefits" (p. 367). Mr. Jenkins further asserts, that "any one who has seen the coolie in British Guiana is forced to admit that he has undergone a change for the better. In illustration of this, we may mention that the number of immigrant depositors in the British Guiana savings-bank on June 13, 1870, was 1817, whose deposits amounted to $138,425, or over $70 a head. The commissioners appointed by her majesty to take evidence on the working of the system at the time Mr. Jenkins went out, state in their report (pp. 854, 855): "From papers submitted by the immigration agent-general, the commissioners gather, that in 12 ships which sailed with returning Indian immigrants between 15th Nov., 1834, and the 11th Nov., 1869, 2,828 immigrants took away with them money acquired in the colony to the amount of $433,369, or £94,452." The great drawbacks of the system appear to be the reckless mode of recruiting in India; the insecurity, if not the actual worthlessness, in Guiana of contracts drawn up in the former country, the severe penalties attached to breach of contract, and the practical difficulties, as the law stands at present, in the way of the coolie obtaining a remedy for any injustice inflicted on him. Immigration from China was stopped for all the West Indies in 1867, on account of the Chinese government insisting on a return passage at the end of five years, which the planters find will not pay them for their outlay. The total number of C. at present in British Guiana is about 50,000.

The reports (1872 and 1877) of the governor of *Trinidad* on the coolie question are satisfactory. In 1870, various laws were passed, all of a just and beneficent character. "Among the most important provisions," says governor Longden, "are those which regulate the allotment of immigrants upon their arrival in the colony, the supply of food to them during the first two years of their residence, their lodging, the medical attendance and hospitals provided for them, their wages, the exemption of women from labor, the prevention of vagrancy, and the right of repatriation." In proof of this it may be stated, that although the coolie has a right to a free passage back to India at the public

expense, after a continuous residence in the island for ten years, in many cases he has preferred to commute this right for a grant of ten acres of crown land, and to settle permanently in the colony. The number of Indian immigrants in 1871 amounted to 27,400. In addition to these must be reckoned 1400 Chinese.

Sir J. P. Grant, governor of *Jamaica*, is no less emphatic in expressing his opinion that a great change for the better has taken place in the treatment of the coolie in that island also. His words are (*Report* for 1871): "Under the old state of things this department [the immigration department] in Jamaica was in a disgraceful state, but it has now been completely reformed under the new system introduced by the new law of 1869." This law secures to the coolie full payment of day-wages at the rate fixed by law as a minimum, unless where he prefers task-work, and also regular daily rations during the whole of his five years' term of indenture, besides putting an end to all stoppages of wages at the arbitrament of only one party to the bargain. Many of the details of medical supervision are extremely creditable to the planters. The census returns for 1872 give the gross number of Indians at 7,793. Here also, as well as in Trinidad, the C. show a disposition to become settlers on the crown lands.

Some recent reports from the island of *Mauritius* are less encouraging, which is much to be deplored, because that island contains more C. than all the rest of our colonial possessions put together. Out of a total pop. of (1875) 344, 600, more than 236,000 were Indian immigrants. It would seem that the relations between employers and employed are not quite satisfactory, though here too, improvement can be noted.

Besides what may be called the *legitimate* traffic in Chinese C. (stopped at present), an infamous counterfeit was long carried on at Macao (q.v.). Native crimps brought thousands of their countrymen to that Portuguese island, and shipped them for Cuba and Peru. This "involuntary emigration," as it has been called, began in 1848, and as many as 13,000 persons were shipped in the course of a year; but as in reality it was nothing more than an elaborate system of kidnapping, the Chinese and British governments, in 1872, prohibited any vessel suspected of being engaged in this trade, from fitting out in any Chinese or British port, and the "trade" was practically destroyed in consequence. At the close of 1873, the Portuguese government formally declared the "exportation" of C. illegal, and the atrocious traffic may now be considered at an end.

Similar to the coolie immigration, though the laborers are not called C., is the importation of Polynesian natives into Queensland to work on the sugar plantations, and into the Fiji islands. By laws of 1868 and 1875, the imperial parliament has secured the rights of a helpless but industrious race. See *In Quest of Coolies*, by J. L. A. Hope, 1872.

COOMASSIE, the capital of the kingdom of Ashantee, western Africa, is situated about 120 m. n.n.w. of Cape Coast Castle, in lat. 6° 35' n., long. 2° 12 w. C. occupies the side of a rocky hill, and is about 4 m. in circuit. The walls of the houses are mostly formed of stakes and wattle-work, the interstices being filled up with clay; the roofs are of palm-leaves. The king's palace is here. C. was captured and burned in 1874 during the war with Great Britain. See ASHANTEE. Pop. stated by natives to be 100,000; but other reports, including observations during the war, say 20,000.

COON'TIE, or COONTA, a plant of s. Florida the stem of which furnishes starch from which arrow-root is made. In the Bahamas and other countries it is called sago.

COOPER, a co. in central Missouri, on the Missouri river, intersected by the Pacific railroad of Missouri, and the Boonville Branch road; 558 sq.m.; pop. '80, 21,638—3,504 colored. The surface is undulating and hilly, and the soil fertile, producing wheat, corn, tobacco, etc. There are mines of coal, iron, and lead, and quarries of marble and hydraulic limestone. Co. seat, Booneville.

COOPER, ANTHONY ASHLEY. See SHAFTESBURY, *ante*.

COOPER, Sir ASTLEY, a celebrated English surgeon, was born at Brooke, in Norfolk, where his father was a curate, in Aug., 1768. In his 16th year, he went to London, and placed himself under the care of Mr. Cline, one of the most noted surgeons of his day. He devoted himself with ardor to his profession, and was a constant attender at the dissecting-rooms, and also at the lectures of the famous John Hunter. In 1787, C. was appointed demonstrator of anatomy at St. Thomas's hospital; and four years after, he assisted Mr. Cline, who was surgeon at St. Thomas's, in the course of lectures on anatomy and surgery. In 1792, he was appointed professor of anatomy at surgeons' hall; and in 1800, surgeon to Guy's hospital. In 1813, he received the professorship of comparative anatomy in the college of surgeons. Meanwhile, C. had been enriching medical literature by various contributions. An essay on the effects resulting from the destruction of the *membrana tympani* gained him, in 1802, the Copley medal of the royal society, of which he was elected a fellow three years afterwards. In 1804–7, appeared his great work on *hernia*, with illustrations mostly of life-size, a contribution of the utmost value to medical science—the anatomy of the disease and the mode of operating for its relief being alike ill understood before—though in a pecuniary point of view it proved very unprofitable to himself. The practical part of his profession was not neglected during this time. He was the first to attempt the tying of the carotid artery, an attempt which, though unsuccessful in his hands, has since proved effectual

in the hands of other practitioners. His annual income, which in the fifth year of his practice only amounted to £100, had in 1813 risen to the enormous sum of £21,000, perhaps the largest ever received by a surgeon. In 1817, he tried what has been considered the boldest experiment ever attempted in surgery, the tying of the aorta, which did not prove successful; and it has since been tried with no better result. In 1820, C. removed a steatomatous tumor from the head of George IV., who marked his appreciation of the operation by conferring a baronetcy upon C. some six months after. In 1822, he was elected one of the court of examiners of the college of surgeons, and in 1827, president. In the following year he received the appointment of sergeant-surgeon to the king, and in 1830 was made vice-president of the royal society. Other honors flowed in upon him. He was made a member of the French institute, and corresponding member of the royal academy of sciences, a D.C.L. of Oxford, and an LL.D. of Edinburgh. Ever busy with his pen as with his knife, he, in 1822, published a work on *Dislocations and Fractures*, which threw much new light on the subjects discussed, and also suggested improved methods of treatment. His treatise on the *Anatomy and Diseases of the Breast* (1829–40) was characterized by all the care, research, and originality which distinguished his previous works; so likewise was his *Anatomy of the Thymus Gland*, 1832. C. died 12th Feb., 1841. A colossal statue to his memory is erected in St. Paul's cathedral, London. As a teacher, C. possessed the faculty of communicating knowledge in a manner at once easy and agreeable; and he elevated medical surgery, the operations of which before his time have been described as a series of "frightful alternatives, or hazardous compromises," into a science.

COOPER, JAMES FENIMORE, an American novelist, was b. at Burlington, N. J., U. S., Sept. 15, 1789. Having received his early education from a private tutor, he, at the age of 13, passed to Yale college, and after three years' study there, entered the American navy as a midshipman. He remained six years at sea, gathering the experience of which he was afterwards to make such good use in his novels. On his retirement from the sea in 1811, he married; and the next ten years of his life were spent in a quiet, domestic fashion. In 1821, appeared his first work, *Precaution*, a novel that afforded no indication whatever of the talent he subsequently exhibited. In the following year, however, he published *The Spy*, a tale which at once secured for him a place in the first rank of novelists. By not a few critics he was even elevated to a higher pedestal than that which Scott occupied; but time sobered their judgment, while it still left him a deservedly high position as a writer of fiction. In quick succession followed *The Pioneers; The Pilot; The Last of the Mohicans; The Red Rover;* and *The Prairie;* with which C.'s genius culminated; for though between this date (1827) and 1850 he wrote about 26 different works, none of them equaled in merit those we have mentioned. The secret of C.'s success as a novelist lies in his graphic descriptive powers, and his thorough knowledge of the matters he describes—whether it be the boundless ocean or the broad prairie—together with an attentive study of character. Not a little of his popularity in America, however, must be attributed to his nationality; and in Europe a good deal of it was owing to the freshness of the scenes in which his stories were laid. About 1827, C. visited Europe, where he remained several years; the fruits of his sojourn, besides novels, being some ten volumes of sketches of European society, which added nothing to his reputation. Many of his works have been translated into most modern languages, and one—*The Spy*—can be read in Persian. C. died at Cooperstown, in the state of New York, 14th Sept., 1851.

COOPER, PETER, b. New York, 1791. When young he was in humble circumstances, and was obliged to pick up an education as best he could. At the age of 17 he was an apprentice at coach-making, where his conduct was so satisfactory that his master offered to start him in business, but he declined to incur the risk. His first start towards a fortune was by the invention of an improvement in machines for shearing cloth. Such machines were in demand while the importation of foreign cloth was prohibited, during the war of 1812–15. Afterwards they were of little account, and he went into the manufacture of cabinetware, and soon afterwards into the grocery business, and finally he began the manufacture of glue and isinglass, in which business he was engaged for more than half a century, accumulating a handsome fortune. But he was at various periods concerned in other affairs. In 1830, he built works for the manufacture of iron, and afterwards a rolling and wire mill in New York, where he first successfully used hard coal in puddling iron. In 1845, he had a rolling-mill for making railroad bars at Trenton, N. J., where he was the first to roll iron beams for building purposes. At Baltimore, in 1830, he designed and built the first locomotive engine constructed in America, and it was soon afterwards operated successfully on the Baltimore and Ohio railroad. He was also among the earliest promoters of telegraphic communication in the country, and was for 18 years president of the New York, Newfoundland, and London telegraph company. He was among the earliest to become interested in the New York state canal. Before the Erie canal was ready for use, it was a serious question what was the best propelling power for the boats. Cooper then made an experiment of propulsion by means of an endless chain. The chain was driven by the power of elevated water; and on an experimental trip with the governor, De Witt Clinton, and a distinguished party, a speed of 2 m. in 11 minutes was gained. Other

power can also be applied to the endless chain. This invention, though not then adopted, has been used in passing boats through canal locks. Always interested in his native city, Cooper was chosen to the board of assistants and of aldermen; and he was also prominent in the establishment of the old public school society. The great object and the great honor of his life, however, was yet to come. Feeling keenly the disadvantages under which he labored when a youth in obtaining education, he long contemplated and finally established an institution (the Cooper union) in which the poor as well as prosperous should have the amplest opportunity for education without cost. In 1854, he laid the corner-stone of a large building at the junction of the Third and Fourth avenues in New York, "to be devoted forever to the union of art and science in their application to the useful purposes of life." This institution, which has had his constant care and help, now counts over 2,000 pupils in the course of the year. It has a school of art for women, with free instruction in all branches of drawing, in painting, wood-engraving, and photography. It has also a free school of telegraphy for young women. These schools for the day-time accommodate 200 to 300 students. In the evenings the free schools of science and art for young men and women give free instruction in mathematics, practical engineering, and practical chemistry; and free lectures are given in natural philosophy and the elements of chemistry. In art, every branch of drawing and painting is taught. A large free reading-room and library with about 300 periodicals and papers, foreign and domestic, and about 10,000 volumes, are at the disposal of all comers. Every Saturday evening during the winter, free lectures are given in the large hall of the Cooper union, sometimes seating 2,000. The annual expense has amounted to about $60,000. In 1879, the founder added an upper story to this most useful institution. He has just passed his 89th birthday, and is still hale and hearty. His son Edward is at present mayor of New York city.

COOPER, SAMUEL, D.D., 1725–83; a native of Boston, and graduate of Harvard. When but twenty years of age, he succeeded his father as pastor of Brattle street church, where he officiated 37 years. He was active in the revolution, sustaining the cause of the people in sermons and pamphlets, and to him Franklin sent the Hutchinson letters. He was one of the founders of the American academy of arts and sciences.

COOPER, THOMAS, b. 1805; an English chartist, in youth a shoemaker, and self-educated so as to become a schoolmaster at the age of 23. He was the leader of the Leicester chartists in 1841, lectured during the riots, and was found guilty of conspiracy and sedition, and sent to prison for two years. While in jail, he wrote an epic poem, *The Purgatory of Suicide*, and a series of stories, entitled *Wise Saws and Modern Instances*. Some time afterwards he wrote papers on *The Condition of the People;* later still, *Triumphs of Perseverance* and *Triumphs of Enterprise*. In 1848, he was lecturing; in 1849, editing a radical penny paper; in 1850, conducting a free-thinking publication. Near the close of 1855, he gave up skepticism, and has since almost continually lectured in support of Christianity. His poetical works were published in 1878.

COOPER, THOMAS, LL.D., 1759–1840; a native of London, educated at Oxford; studied medicine and law, and was admitted to the bar. He visited France in the interest of the English democratic clubs, and became conspicuous among the Girondists, for which he was taken to task by Burke in a speech in the house of commons. Cooper wrote a virulent reply, but its circulation was prohibited by the government. Coming to the United States, he started law practice in Philadelphia, and soon mixed in politics in opposition to the administration of John Adams, on whom he made a gross attack in a newspaper. Under the alien and sedition laws, he was tried for libel, convicted, and sentenced to a fine and six months' imprisonment. As soon as the democratic party came into power, he was rewarded by the appointment of judge, but he soon became so odious to the party that he was removed. In later years, he was professor of chemistry in Dickinson college, in Pennsylvania university, and South Carolina college in Columbia, of which he became president. His latest work was a revision of the statutes of South Carolina. Among his publications are *Information Concerning America; An English Version of the Institutes of Justinian; Lectures on the Elements of Political Economy*, etc.

COOPER, THOMAS SIDNEY, b. 1803; an English painter, who began as scene-painter in a theater at the age of 17. After much work and travel, he married and settled in Brussels, where his talents, especially in painting animals, were appreciated. The revolution involved him in trouble, and he returned to England, where he has enjoyed complete success.

COOPERAGE, the art of making vessels of pieces of wood bound together by hoops. It is a very ancient art, such vessels having been in use among the Romans at the period of the Christian era. The upright pieces forming the sides of a barrel, or cask, or other cooper's work, are called *staves;* and, as casks are usually larger in the middle than at the top and bottom, this swelling, called the *belly* or *boulge*, is formed by skillfully shaping each stave so that it shall form part of the required double conoid, and that, when all are built and hooped together, their edges shall coincide perfectly; for this purpose, each stave is made broadest in the middle, and narrowed down in a curved line towards each end. A skillful cooper can work this curve so accurately that no further fitting or

alteration shall be needed when the staves are put together. The staves are made to meet at their inner edges, and by driving the hoops very hard, the inner part is compressed until the slight gaping outside is closed, and thus slight inaccuracies of fitting are remedied.

There are several branches of cooperage. The *wet* or *tight* cooper makes vessels for holding liquids. The *dry* cooper does inferior work, such as barrels for containing dry goods, where an inferior degree of accuracy is sufficient. The *white* cooper makes churns, pails, etc., which for the most part have straight sides.

The best work is made of oak, which must be thoroughly dried before being put together. In warm countries, the drying of the sun is sufficient, and casks are therefore mounted in summer only; but in Britain, artificial drying is commonly resorted to. The hoops are hammered down from the narrow to the wide part of the cask, by means of a mallet striking a piece of wood held against the hoop. Iron hoops are sometimes put on hot, in order that their contraction on cooling may bind the work together.

CO-OPERA'TION is the term applied to a system of united effort for commercial or industrial purposes. It refers simply to a joint-stock copartnery on ordinary commercial principles, with limited liability of members; but by the interposition of the legislature for protecting individual interests, and encouraging self-denial and thrift, it possesses some distinct features. Usually, a co-operative society consists of a body, several hundreds in number, belonging to the manual laboring classes, clerks, shop-assistants, etc.; the object being the distribution of articles of daily consumption among the members. A store is established under a manager and assistants; goods of the best quality are purchased on favorable terms, and retailed to members at such an advance on cost price as will pay expenses and leave a small profit over. All the sales whatsoever are for ready money; no credit is given. Soundness in the articles bought and comparative cheapness are alone aimed at; and such results are attained by care in the management, and by adhering to the ready-money system. There is little trouble in book-keeping, no loss from giving credit. In point of fact, the customers of the concern are their own shop-keepers. To carry out any such principle of co-operation with advantage, there must be a large intelligent population, along with mutual trust, and a considerable similarity of tastes.

Membership is constituted by payment of shares. Ordinarily, the share is one pound sterling, to be paid up at once, or by small weekly installments. By 18 and 19 Vict. c. 63, a member can own shares to the amount of £200. The shares are not transferable, unless the rules of the society make them so in whole or part, but in general non-transferability is adopted, with power of withdrawal; this constitutes the chief difference between C. and the common joint-stock system of business. The peculiarity of making the shares personal to the holder is most valuable; for by it all stock-jobbing or gambling in shares is prevented. When a member dies, his shares are accounted for to his representatives. If more money is paid in by members than is wanted, the directors can order the overplus to be taken back. The first shilling paid in, and the last shilling at the credit of a member, on drawing out, are carried to a fund called redemption-money, which is designed to make good the deterioration of property. In this and some other respects, however, societies differ, according to the rules established. In some societies, shareholders or members are alone entitled to purchase goods at the stores; in others, the privilege is extended to "friends of members" approved by the association.

By prudent management, numerous co-operative societies in England have reached an extraordinary degree of success. One of the more remarkable is the Rochdale Equitable Pioneers' Society. Beginning in 1844, with a capital of only £28, its affairs, at the end of 1877 stood thus: Number of members, 9,722; amount of funds, £280,275; business done in 1877, £311,754; profits in 1877, £51,648. In the proceedings of this society is offered a surprising example of what may be done by C. when properly conducted. One material cause of the prosperous extension of this undertaking consists in the fact, that members allow their dividends and profits to accumulate to their credit, instead of drawing them out as they accrue, and spending them. Another feature of this society consists in setting aside a part of the profits for the support of an educational department, in which are comprehended a lending library, a reference library, newsrooms, and collections of globes, maps, and scientific instruments. Out of the successes of this society sprang several gigantic concerns at Rochdale and elsewhere. The most notable of the London societies is the Civil Service Supply Association, designed for the benefit of others than the poorer classes of the community. It has 4,500 shareholders, and many thousands of members. The wages paid amount to nearly £50,000 a year. The premises which form the headquarters of the association are valued at £32,000. In the first year, 1867, the sales of the association represented a value of £21,322; in the year ending Aug., 1877, the value of the sales reached the large sum of £1,041,294. On an average the prices charged to members and clients are at the rate of 10 per cent above wholesale prices, thus allowing a profit to defray working expenses, which amount to about 7½ per cent. The allowance has proved more than sufficient; between Mar., 1874, and Aug., 1877, the surplus profit accumulated to the amount of very nearly £100,000. As the aim of the association is "to supply articles at the lowest possible prices," it is proposed to reduce the present high rate of interest.

A step beyond retail store-keeping was taken in 1864 by the establishment of the North of England Co-operative Wholesale Society (limited), the central office of which is at Manchester. Its object is to supply goods wholesale to co-operative stores. Besides importing foreign articles, the society purchases vast quantities of butter, provisions, and dry goods in all parts of the United Kingdom; latterly, the manufacture of biscuits and the business of banking have been added to this comprehensive concern, which has numerous branches and agents. C., however, has gone even beyond this. At Rochdale, Leeds, and elsewhere, co-operative societies composed of working-men have set on foot large cotton-factories, flour-mills, or other industrial establishments, which compete in the general field of manufacturing enterprise. In these concerns, the operatives receive weekly wages, and also dividends on profits after paying for management.

Co-operative societies are registered pursuant to 18 and 19 Vict. c. 63, 20 and 21 Vict. c. 101, and 30 and 31 Vict. c. 117. The rules of the society are binding, and may be legally enforced—protection is given to members, their wives, children, and heirs in enforcing their just claims, and against any fraudulent dissolution of the society; the property of the society is declared to be vested in the trustee or treasurer, who may, with respect to the property of the society, sue and be sued in his own name; fraud committed with respect to the property of the society is punished by justices. With a view to afford means for mutual advice and consultation, there has been established a Central Co-operation Board at Manchester; the members connected with which hold congresses and conferences at different places.

For further information, we refer to the statutes; also to the *Co-operative News;* the reports of the above-mentioned bodies; the annual sheet *Almanack of the Rochdale Equitable Pioneers;* the published *Transactions of the National Association for Promoting Social Science;* and Chambers' *Information for the People,* No. 85, "Social Economics." See likewise the article BENEFIT SOCIETIES.

W. C.

CO-OPERATION (*ante*), as a system of united effort for commercial or industrial purposes, has been introduced and is spreading among the working classes of this country.

1. They co-operate in providing homes for themselves. Building-loan associations have existed in Philadelphia about 30 years. The members subscribe for a given number of shares and pay one dollar on each share every month for a term of years, until the sums paid and the interest on them amount to $200—the full value of the shares. This usually requires about 10 years. The money thus provided is loaned to the highest bidder. Each shareholder who builds or buys a house can, in order to help pay for it, borrow a part of the accumulated fund equal to the full value of his shares, paying the stipulated interest on it monthly, and giving, as security, a mortgage on the house. When his shares attain their full value, he has enough to pay the principal of the debt and cancel the mortgage. There are in Philadelphia more than 500 of these associations, with an ultimate capital of 100 millions of dollars. They have given homes to 60,000 workingmen, and now hold 80,000 mortgages, which are being paid off by monthly installments. Similar associations have been formed in Boston, where they are growing rapidly in usefulness, popularity, and strength, and in nine other cities of Massachusetts. They are flourishing also in various other parts of the United States. Their advocates claim for them many decided advantages. (1) They enable workingmen to have the benefit of their earnings in advance, by building houses and paying for them in monthly installments. (2) The monthly payments on mortgages are more easily met. (3) They instruct the industrial classes in the management of property. (4) They yield a larger interest than could otherwise be profitably paid. (5) They do not require payment of the principal until the shares are complete.

2. A co-operative store was started in Boston, April, 1879. Fifteen hundred shares were subscribed for at $4 each. The inducements offered by the system and the advantages resulting from it, are: goods of the best quality only are sold, and at market prices; full weight and measure are guaranteed; civility from store-keepers and salesmen is assured; no losses from bad debts are incurred; and an equitable share of the profits is enjoyed by all who have any pecuniary interest in the store. The by-laws provide that a quarterly adjustment of interest and profits shall be made, when, if the profits are sufficient, all the shares shall be credited with interest at the rate of 6 per cent. After that has been done, if there have been a net profit the contingent fund is to be credited with the percentage required by law, and the balance distributed among the purchasers. Every one making a purchase, however small, receives a check showing the amount, a duplicate of which is kept by the store. At the end of the quarter he receives a dividend of the profits in cash in proportion to the aggregate amount of his checks; the rate to those who do not own shares being half that of those who do. At the end of the first quarter, the profits were sufficient to pay 6 per cent on the stock, 4 per cent on all purchases made by shareholders, and 2 per cent to other buyers. At the end of the second quarter, the dividend was 6 per cent on stock and 6 on purchases. The number of shareholders is now 650. The capital is limited to $100,000. To enable the poorest to become stockholders, any person by paying fifty cents can have his dividends on purchases placed to his credit, and when they amount to $4, a share will be issued to him. New shares also can be obtained by allowing dividends to remain. These

associations are specially adapted to large manufacturing districts, and the interest in them among workingmen and philanthropists is spreading widely.

COOPER RIVER, a stream in South Carolina, rising in Charleston co., flowing s.e. and uniting with the Ashley below the city of Charleston. It is navigable for 30 m. to a canal connecting with the Santee.

COOPERSTOWN, a village and seat of justice of Otsego co., N. Y., 60 m. w. of Albany, at the outlet of Otsego lake; reached by the Cooperstown and Susquehanna Valley railroad; pop. 2,300. It is in a fine and picturesque situation. The American novelist, James Fenimore Cooper, had his residence here, as did his father, after whom the village is named.

CO-OR'DINATES. What is called the method of C. is an invention of Descartes, whereby algebra and the calculus may be employed in geometrical investigations. The method is sometimes called algebraical geometry—sometimes, and more properly, analytical geometry; and it is commonly treated under the heads "geometry of two dimensions," and "geometry of three dimensions," according as it is applied to investigate the properties of figures all in one plane, or of curved surfaces. The method is capable of popular explanation. C. are lines so measured off from a fixed point, called the origin of C., along fixed lines passing through it, called the axis of C., as to determine by their quantities the position of any other point relative to the origin. The first step is to find how to determine the position of a point in a plane. Take any fixed point in it for the origin of C., and through it draw two fixed lines—the co-ordinate axes—at right angles to one another. Then, if the perpendicular distance of the point from each of these axes be given, its position will be determined. Referring to Fig. 1, if P be the point, and O be taken for the origin of C., OX, OY for the axes, then if we know NP or OM, the perpendicular distance of P from OY, and measure off from O, OM on the axis OX, and through M raise a line perpendicular to OX, P must lie in this line, for it contains all the points in the plane which are at the perpendicular distance OM from the axis OY. Similarly, if ON or PN, the perpendicular distance of P from the axis OX, be known, and we measure that distance off from O along OY, and through N draw a perpendicular to OY, the point must be in that perpendicular. It is therefore at the intersection of the perpendiculars through M and N respectively. When, as in the figure, the fixed lines are at right angles to one another, the C. OM, ON are called the rectangular C. of the point. Let us now see what use can be made of this mode of determining the position of the point, for the discovery of the properties of lines and surfaces. As the values of the C. change for the different points in the plane, they are denoted by the variables x and y. Now, if we suppose the point P to begin to move according to a determinate law, and the C. to change their magnitudes so as always to be its C., knowing the law of P's motion, we are able to express in algebraical language the law of the corresponding changes in its co-ordinates. For instance, if P moves so as to be always at the same distance from O, OP is constant, and (47th Prop. Euclid, Book I.) the square on OP is equal to the sum of the squares on OM and PM. Putting this into algebraical language, we have the equation, $x^2 + y^2 = R^2$, or $y = \pm \sqrt{R^2 - x^2}$, where R = OP. This is called the equation of the circle referred to its center as origin, and to rectangular C.; and it expresses the law according to which the changes of the C. must take place: and from this equation, combined with that to a straight line, etc., every property of the circle may be determined. If P move so that the sum of the distances from two fixed points shall be always the same, and we express the relation between x and y in that case, we should have the equation of an ellipse. This suffices to show in a general way the nature of the method. Equations between x and y are called the equations of the lines, whether straight or curved, traced out by the point P; and by means of them, though they but express relations between *quantities*, the *qualities* of the lines to which they refer may, by artifices explained in every treatise on the subject, be detected. Nay, by assuming equations between x and y, and examining the lines which points represented by them would trace, many singular curves have been discovered. There are a variety of conditions to be attended to in the interpretation of such equations, depending on the assumptions set out with, in choosing the origin and axis. The axis of x or OX being taken to the right of the origin, and the axis of y or OY being perpendicular to it and above it, x and y are counted positive when they are measured along their axes to the right of and above the origin respectively, and negative when they are measured to the left and downwards respectively. Suppose $x = OM = ON$, and $y = MP = MP_1 = NP_2 = NP_3$, the C. of the points P, P_1, P_2, P_3 would be $(+x, +y)$, $(+x, -y)$, $(-x, +y)$, $(-x, -y)$ respectively. These points being equidistant from O, we may suppose a circle to pass through them. Recurring now to the equation of the circle, $y = \pm \sqrt{R^2 - x^2}$, the meaning will be seen of the two values + and − of y given by the quadratic. Often the axes of C.

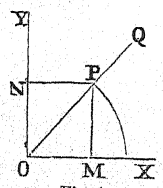

Fig. 1.

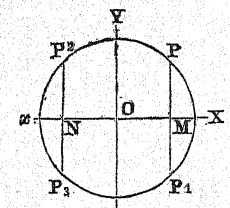

Fig. 2.

selected for convenience are oblique, i.e., inclined at some other angle than a right angle. An equation between C. referred to one set of axes may always be transformed to C. referred to another, by the process known as the transformation of co-ordinates. A similar transformation of equations by the same process may be made where it is desired to refer the line to a new origin.

What has hitherto been said refers entirely to the C. of a point in a plane, or to what is called geometry of two dimensions. But the rationale is the same with that of connecting in equations the C. of points in space—the subjects of geometry of three dimensions. The position of a point in space requires three C. to determine it, and these are usually denoted by the symbols x, y, z. An origin being taken, and three axes, OX, OY, OZ, mutually at right angles to one another, the point is referred to the three planes through these axes. z, or PN, is its height above the plane though YOX; y, or NM, is its distance perpendicularly from the plane XOZ; and x, or OM, is its perpendicular distance from the plane ZOY. It is clear that these three determine the position of the point. In three dimensions, as in two, the problem may be stated to be: Given the law of the motion of P, to express the law regulating the variations of its C. as it moves. The algebraic expression of the latter law is, the equation of the surface traced by the point in moving over all the space it can traverse consistently with the law of its motion. The method of C., besides its use in geometry, is of great value for resolving forces in mechanics, and also for finding the resultant of a great many of them.

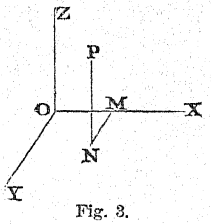

Fig. 3.

COORG, a province under the government of India, bounded by Mysore, Malabar, and Canara, is situated in lat. 11° 56′ to 12° 45′ n., long. 75° 25′ to 76° 13′ east. It contains about 2,000 sq.m., and in 1871, 168,312 inhabitants. Down to 1834, it was a native principality of ampler dimensions. As at present defined, C. appears to be wholly within the basin of the Cauvery, one of the chief tributaries of the bay of Bengal. From its elevated situation—the lowest point is more than 3,000 ft. above the sea—C. is exposed to both the s.w. and n.e. monsoons. Hence the yearly fall of rain amounts to about 120 inches. For the same reason, the temperature is comparatively low and equable. Nearly the whole of this rugged region is covered with forests, more or less dense, but seldom so full of undergrowth as to form jungle. The zoology of C. comprises elephants, tigers, bears, etc., with birds and reptiles in vast variety. The natives, mostly Nairs, are handsome and athletic. Among them there exists a community of wives between brothers. But C. has perhaps nothing so worthy of notice as its artificial fortifications. The country is intersected by ramparts, which are from 15 to 25 ft. in height, and by ditches of about 10 ft. in depth and about 8 in width; while, being in some places double or triple, or even quadruple, they measure in aggregate length upwards of 500 miles. These works are very ancient. The true name of this territory is *Kudagu*, C. being a corrupt form.

COÖS, a co. forming the n. portion of New Hampshire, bordering on Maine and Canada, and separated from Vermont by the Connecticut river, intersected by the Androscoggin river, and traversed by the Grand Trunk railroad of Canada, and the White Mountain railroad; 1950 sq.m.; pop. '80, 18,580. The surface is hilly and the climate cold. The chief productions are oats, potatoes, butter, wool, and maple sugar. Co. seat, Lancaster.

COÖS, a co. in s.w. Oregon, on the Pacific ocean, watered by the Coös and the Coquilla rivers, and bordered on the e. by the Umpqua mountains; 1500 sq.m.; pop. '80, 4,834. Productions chiefly agricultural. Gold, copper, and iron have been found. Co. seat, Empire City.

COOSA, a co. in central Alabama, watered by the Coosa and Hatchet rivers; 600 sq.m.; pop. '80, 15,132—5,082 colored. The surface is hilly, but the soil is productive, yielding corn, cotton, etc. Co. seat, Rockford.

COOSA RIVER, rising in n.w. Georgia, and flowing through n.e. Alabama until it joins the Tallapoosa, the two forming the Alabama. The Coosa is about 350 m. long, and navigable in some parts.

COÖS BAY, a seaport on the Pacific in s. Oregon, at the mouth of Coös river. The entrance is n.e. of cape Arago over a bar with 14 ft. of water at high tide. Great quantities of lignitic coal are found around the shores of the bay.

COO'SY—not to be confounded with the much smaller Coossy which enters the Hoogly from the right below Calcutta—is one of the largest rivers of India. It rises in lat. 28° 25′ n., and long. 86° 11′ e., on the southern slope of the Himalayas, receiving, however, at least one affluent from the northern face of that range. On emerging from the mountains, in lat. 26° 45′, and long. 87° 13′, it shows a greater volume than does the Ganges itself, in the corresponding position of Hurdwar. After a course of 325 m. in all, through the state of Nepaul and the district of Purneah, it joins the Ganges from the left, in lat. 25° 19′, and long. 87° 19′.

COOT, *Fulica,* a genus of birds of the order *grallæ,* either ranked in the family *rallidæ* (rails, crakes, etc.), or in a separate family, *lobipedidæ,* which differs chiefly in having the toes edged with a scolloped membrane, thus making an approach to the web-footed birds. Coots have a strong, straight, and somewhat conical bill, the base of which extends up the forehead, and there dilates so as to form a remarkable naked patch. The tail is very short. They are aquatic in their habits, preferring lakes or pools with reedy margins, and retreating among the reeds on any alarm. The common C. (*F. atra*) is found in most parts of Europe, Asia, and the n. of Africa; occurring in the more northerly regions as a summer bird of passage, which is the case in the n. of Scotland, although in the more southerly parts of Britain it is plentiful during winter. It is about 16 in. long, of a black color, with a narrow white bar across the wings, and the naked patch on the forehead pure white, from which it is often called the bald coot. It makes a large nest of water-plants among reeds or rushes. Although not very highly esteemed for the table, the circumstance that many can be killed by a single shot, on the mud-banks to which coots resort in winter, as on the s. coast of England, makes C. shooting profitable to the fowlers who purvey for the market.—The American C. (*F. Americana*), a very similar species, is found in all parts of North America, from the West Indies to the Saskatchewan.

COOTE'HILL, a t. in the n.e. of Cavan co., Ireland, on the Cootehill, an affluent of the Annalee, 28 m. w.n.w. of Dundalk. It consists chiefly of four wide streets, and is situated at the w. end of a series of lakes navigable for about 7 m. to the e. to near Ballybay. It has a trade in linen. Pop. '71, 1851.

CO'PÄIS, LAKE. See BŒOTIA.

COPAI'VA, or **COPAIBA, BALSAM OF,** a valuable medicinal substance, consisting chiefly of a resin (*resin of copaiva*) and a volatile oil (*oil of copaiva*). It flows from incisions made in the stems of trees of the genus *copaifera,* trees with pinnate leaves, of the natural order *leguminosæ,* sub-order *cæsalpiniæ,* natives of the tropical parts of America. It has a peculiar, not disagreeable odor, and an acrid taste. It has stimulant properties, is diuretic when taken in small doses, aperient in larger doses; but is principally useful from its powerful action on the mucous membranes. It is much used in affections of the urino-genital system, and is also employed in chronic catarrhs, etc. Balsam of C. is not unfrequently adulterated with castor oil. The wood oil (q.v.) or gurgina balsam of India, the produce of a species of *dipterocarpus,* is sometimes sold in Britain as balsam of copaiva.

CO'PAL, a resinous substance used for a variety of purposes in the arts. It appears in commerce in smooth rounded masses, colorless or lemon-yellow, translucent or transparent, rather brittle, and in a cold state almost without smell or taste. It is readily fusible and inflammable, is insoluble in water, and only partially soluble in alcohol and oil of turpentine, but becomes entirely soluble in them when it has been for a short time melted. Various useful pale-yellow or almost colorless varnishes and lackers are made of melted C. and alcohol, oil of turpentine, or boiled linseed oil.

C. is said to be a general Mexican name for resins or gums, and the C. of commerce was, perhaps, originally brought from Mexico. C. is also obtained in Africa, Brazil, Madagascar, and India. Mexican C. is now believed to be the produce of a species of *hymenæa,* a tree of the natural order *leguminosæ,* sub-order *cæsalpiniæ. Vateria indica,* a large tree of the natural order *dipteraceæ,* yields the C. of India, very nearly resembling true C. in its properties, but also sometimes called gum animé (q.v.) in British commerce.—A mineral substance resembling C., and therefore called *fossil C.* or *copaline,* is found in some places, as at Highgate, near London, from which it is called *Highgate resin.*

COPAL'CHE BARK, a bark resembling cascarilla bark (q.v.) in its properties, and produced by shrubs of the same genus, *croton pseudo-china* and *C. suberosum* (see CROTON), natives of Mexico. The former yields a variety in small quills; that produced by the latter is in larger quills, and has a corky epidermis. C. B. is much used as a substitute for *cinchona,* in the cure of intermittents in Mexico, and is imported, although not to a large extent, into Europe.

COPALM. See LIQUIDAMBAR.

COPAN', a ruined city of Honduras, on the borders of Guatemala, in Central America. It stands on a stream of its own name, an affluent of the Motagua. The remains, extending about 2 m. along the river, comprise a temple of 624 ft. in length, various pyramidal structures and sculptured idols similar to those of Egypt and India.

COPAR'CENARY. An estate in England originating in descent to two or more persons, called thence coparcenars or parcenars. It generally arises under the rule of law which makes the daughters of one dying without male heirs inherit equally, but it may also arise by local custom, as in the case of gavelkind (q.v.). Although the property remains unsevered, yet each parcenar is entitled to a distinct share of it, and consequently there is no benefit of survivorship, but the right of each descends to his or her heirs, who are still called coparcenars with the surviving original parcenars. The rule of descent is also *per stirpes,* so that the heirs of one who has predeceased the common ancestor take only the share which would have come to their immediate ances-

tor had he or she survived, and thus a grandson of the common ancestor will also exclude his own sisters. If one of the coparcenars alienates his share, the C. is destroyed, and the estate becomes a tenancy in common (q.v.). C. may also be destroyed by partition, when the estates become in severalty (q.v.). This may be effected either by voluntary agreement, or by a suit in chancery. Such parts of the property as cannot be divided (such as the manor-house, etc.), pass to the eldest sister or her issue, but an equivalent in value is assigned to the remaining sisters. An advowson (q.v.) is exercised in turns, according to seniority. If the estates in C. are by descent reunited in one person, they become again an estate in severalty.

COPARTNERY. See PARTNERSHIP.

COPE, an ecclesiastical vestment, worn during the celebration of mass, at processions, vespers, and other solemnities. The C. was originally a cloak worn for ordinary purposes. In form it is a semicircle, without sleeves and with a hood. It is fastened across the breast with a clasp or morse. Copes soon began to be ornamented with embroidery, and even with jewels; and so early as the 13th c. they became the most magnificent and costly of all the vestments of the priesthood.

COPE, a custom or tribute due to the crown, or lord of the soil, out of the lead-mines in Derbyshire.

COPE, CHARLES WEST, b. 1811; an English painter, the son of an artist. His first work exhibited was "The Holy Family," in 1831, since which time he has produced a great number of pieces. Among them are: "Hagar and Ishmael," "The Cronies," "Paolo and Francesca," "Flemish Mother," "Almsgiving," "The School-master," "The Cotter's Saturday Night," "Trial by Jury" (his first cartoon), "Meeting of Jacob and Rachel," and dozens of others. Among some of the latest are: "Taming the Shrew," "Anne Page and Slender," "Home Attractions," "Spring Time," "Bianca's Lovers," "Hope Deferred," and "Cameron's Welcome Home from the Explorations in Africa." He was one of the original members of the Etching club, and is one of the trustees of the royal academy.

COPE, EDWARD DRINKER, b. Philadelphia, 1840; naturalist and comparative anatomist, frequent contributor to scientific publications, writing on the herpetology of tropical regions, ichthyology of the United States, reptilia of several explorations, cetacea of the North American coast, extinct cetacea of the United States, etc. He has also published papers on *The Hypothesis of Evolution, Physical and Metaphysical; On the Method of Creation, or the Law of Organic Development; Extinct Vertebrates of the Eocene of Wyoming and Nevada; New Vertebrata from the Tertiary of Colorado.*

COPE, Sir JOHN, an English general of the first half of the 18th c., is known through his ignominious defeat at the battle of Prestonpans by the Highlanders, under prince Charles Edward Stuart, Sept. 21, 1745, and more widely through a sarcastic Jacobite song.

COPE, THOMAS PYM, 1768-1854; b. Penn.; a distinguished merchant in Philadelphia who started the first line of sailing vessels between that city and Liverpool. He was largely instrumental in introducing the Schuylkill water to Philadelphia.

CO'PEC, a Russian coin, the oldest kind in Russia, and the first substitute for furs as a medium of exchange. The name is derived from the Russian word for a lance, St. George and his lance having anciently figured on the coin. Copecs were originally coined of silver alone, but copper copecs were afterwards introduced. The present C. is the hundredth part of a silver ruble, which is worth 3*s.* 1½*d.* sterling.

COPENHA'GEN (Dan. *Kjöbenhavn,* "Merchants' Haven"), the capital of Denmark, is situated on the island of Sjælland, in the Sound, which is here about 15 m. broad, and includes the island of Amager or Amak, which is separated from Sjælland by a narrow arm of the sea, forming a fine and capacious harbor. Lat. 55° 41′ n., long. 12° 35′ east. C. lies very low, and was strongly fortified until 1864, when the land-works were destroyed, although the citadel of Frederickshavn, and some of the batteries on the sea, were left in a condition to admit of being defended in case of emergency. The old ramparts of the city and citadel, which are planted with trees, afford pleasant walks. The population of C. was, in 1876, 233,000. Copenhagen proper, in Sjælland, and Christianshavn on Amager, which form the main divisions of the city, are united together by the bridges Langebro and Knippelsbro. The business quarter of C. stretches from its noble harbor in a n.e. direction towards the principal and central square, Kongens Nyton, which in itself forms the focus of the life of the city. Further n. and e. of this point lies the aristocratic quarter, with the handsome Amalienborg square of royal and administerial palaces; and this district is bounded in the extreme n. by the citadel, and the adjoining public gardens and walks on the shores of the Sound. C. has suffered so severely during the last century from the effects of fires and bombardments, that the city contains comparatively few remains of antiquity. Amongst its few buildings of historical interest or intrinsic beauty, we may instance the metropolitan cathedral church, known as Vor Fruekirke, rebuilt after the bombardment of 1807, and distinguished now for possessing statues of Christ and the apostles, together with a kneeling angel bearing a baptismal shell-font, which were designed, and in part

executed, by Thorwaldsen himself. Trinitatiskirke, only remarkable for its round tower, which is ascended by a winding causeway instead of steps; and Holmens' Kirke, containing interesting monuments to the great naval heroes, Juel and Tordenskjold. The royal palace, called Christiansborg, is one of the most extensive in Europe, though its architectural character is not high. It contains, however, a picture gallery, and some noble works of art by Thorwaldsen and others. The castle of Rosenborg, where the regalia are kept, contains interesting collections of objects of art; and the palace of Charlottenborg is now used as an academy of arts. The university was founded by Christian I. in 1479, but the constitution under which it at present exists bears date 1788. The number of professors amounts to about 50, and that of students to 1200. Connected with the university are a surgical academy, two observatories, a botanical garden, a polytechnic institution, and a library of 240,000 volumes, containing also a great collection of ancient Persian MSS., and another of ancient northern MSS. C. is the center, not only of Danish, but of northern literature and art, and is the seat of a number of societies for the advancement of these in all their branches, amongst which the most important are the literary and scientific association, founded in 1742; the academy of arts; and the royal society for northern antiquities, founded in 1825. The royal library contains 500,000 volumes, besides great treasures of Sanscrit and other MSS. The museum of northern antiquities in Christiansborg is unrivaled in its kind, and contains an admirably arranged collection of *stone* weapons, ornaments, etc., to 500 B.C., bronzes to 500 A.D., and articles wrought in iron, silver, and gold to 1000 A.D., besides numerous specimens to illustrate arts and manufactures in Scandinavia during the Christian ages. The Thorwaldsen museum, opened in 1846, consists of works of art by that sculptor himself, and others left by him to the Danish nation, for which a separate building has been erected. C. contains also a number of well-supported benevolent institutions. Since the war of 1864, C. has rapidly recovered its commercial activity, and now its trade is steadily increasing. In 1874, C. possessed 398 ships of 63,118 tons, while between 8,000 and 9,000 vessels annually enter its port. Leather, wool, grain, and oils are its staple commodities. Its royal porcelain works have long enjoyed a European reputation, but, besides these and a few manufactories for gloves, glass, etc., C. has no branches of industry worthy of any special notice in this article.

About the middle of the 12th c., C. was an insignificant fishing-village, in the neighborhood of which bishop Axel, or Absalon, built a castle. He bequeathed the castle, village, and neighboring district to the bishopric of Roeskilde. In 1254, the village obtained the privileges of a town, and in 1443 king Christopher made it the capital of the kingdom. It was several times attacked by the Hanseatic league; was besieged and bombarded by the Swedes in the 17th c.; suffered grievously by fires in 1728, 1794, and 1795; witnessed a great sea-fight in its roads on 2d April, 1801, when the English, under sir Hyde Parker, with Nelson as his second in command, were victorious over the Danish fleet; and was bombarded by the English from the 2d to the 5th of September, 1807, when great destruction was wrought, both in houses and public buildings, and about 2,000 persons lost their lives.

COPERNICAN SYSTEM, THE, is that which represents the sun to be at rest in the center, and the earth and planets to move round it in ellipses; in other words, it is that which we now know, on unquestionable evidence, to be the true system of the world. It got its name from Copernicus, but, in point of fact, it may be described as being a growth to which he was only one of many contributors. The merit of having first formed the general notion of the system seems to be due to Pythagoras; Copernicus has the credit of having, after the lapse of centuries, again drawn the attention of philosophers to it, and of having greatly increased the probability of its truth by his calculations and arguments; for the rest, the glory of having matured its idea belongs to Kepler, Galileo, and others, and to our own Newton, who, through the discovery of the law of gravitation, demonstrated its truth effectually. Many who have been used to reverence the name of Copernicus in connection with this system, would be surprised to find, on perusing his work *De Revolutionibus Orbium*, how much of error, unsound reasoning, and happy conjecture combined to secure for him in all times the association of the system with his name.

De Revolutionibus Orbium, dedicated to pope Paul III., consists of six books, in which Copernicus undertook to demonstrate his whole system. The character of the reasoning which then passed for demonstration, must be borne in mind in judging of the author's procedure in establishing his various positions. It was then thought a sufficient demonstration of a phenomenon to make a supposition, on which its occurrence would be intelligible, without attempting to bring the supposition itself, by an induction of facts, within the truth of nature; many abstract propositions, too, which would now appear to be simply silly, were at that time universally admitted to be of great weight in scientific arguments.

Illustrations of both of these peculiarities may be gleaned from the first of the six books of *De Revolutionibus*. It contains the following propositions: 1. That the universe is spherical. This is established by such arguments, as that the sphere is the most perfect figure, etc. 2. That the earth is spherical, which flows from the same kind of consider-

ations. 3. That the earth and sea make one globe. 4. That the motions of all the heavenly bodies must be uniform and circular, or compounded of uniform and circular motions. Here, again, we meet with singular reasons. A *simple* body must move circularly, and nothing but circular motion could give periodicity to phenomena. 5. That, supposing the distance of the stars to be immense, there is no reason why the earth should not have a motion round its axis as well as a motion in its orbit. 6. That the sphere of the stars is immensely distant. The proof is fanciful, and shows he had no notion of a universe of stars pervading space. 7 and 8. The ancients were wrong in placing the earth at the center of the universe. The arguments under this head are as imaginary as those which they were designed to refute. The falling of a body to the earth he deduces from the assumption that it is only given to wholes to move circularly, while it is of the nature of parts, separated from their wholes, to move in right lines. That there must be a *centrum mundi*, an entity unknown to modern science, is admitted, the question being as to its position. 9. It is possible for the earth to have several motions. 10. He establishes the order of the planets, and draws a diagram of the system much as it is now represented. It may be observed that, following the old systems, such as the Ptolemaic, he lays down *a sphere* for the fixed stars. (See FIRMAMENT.) It is clear, also, that he had no idea of the motions of the planets other than that they were such as would be caused by their being fixed in immense crystal spheres revolving round the sun.

The most brilliant and valuable part of the *De Revolutionibus* is that in which he explained, for the first time, the variations of the seasons, the precession of the equinoxes, and the stations and retrogradations of the planets. In general, his explanations are right, and perfect as to the general nature of the causes of the phenomena. But Copernicus had neither mathematical nor mechanical knowledge sufficient to enable him to explain more than the mean motions of the solar system. To account for irregularities, he was obliged to introduce a system of epicycles entirely resembling that of Ptolemy. See PTOLEMAIC SYSTEM. This arose from the false notion of his times, that all motions must be compounded of circular ones, with the application of which idea, and with the invention of convenient epicycles, the greater part of the *De Revolutionibus* is occupied. It may further be added, to rectify the vulgar notion regarding the relation of Copernicus to the system of the heavens, that he had no answer to offer to the mechanical objections to his system. Most of them, indeed, were such as could not possibly be met in the then state of mechanical knowledge. One of the commonest was that against the axial motion of the earth, that it was inconsistent with the fact of bodies falling to the points of the earth directly beneath the points from which they are dropped; for this he had no answer, nor could he have, the laws of motion being not yet discovered. Such being the state of the case, the reader will consider whether, when Copernicus wrote that he held the doctrine of the earth's motion as a mere hypothesis, and not as absolutely in fact true, it is more likely that he made a concession to the religious prejudices of his times, or to difficulties surrounding his hypothesis, which he could well appreciate though not overcome.

COPERNI'CIA. See CARNAHUBA PALM.

COPER'NICUS, NICOLAS, an eminent astronomer, was b. at Thorn, in Prussia, 19th Feb., 1473. He was instructed in the Latin and Greek languages at home; afterwards he was sent to the university of Cracow, where he studied philosophy and mathematics, and took the degree of doctor of medicine. He also studied law at Bologna university. His natural bent, however, was towards mathematics, the study of which he pursued with passion through all its branches.

Having become enamored of the study of astronomy, he projected a journey to Rome in his enthusiastic admiration of Regiomontanus, who resided there, and was then the most illustrious of the astronomers. On his arrival he was kindly received by Regiomontanus, whom he soon rivaled in fame. Here his reputation, and the favor of his distinguished friend, led to his being chosen professor of mathematics, which he taught for several years most successfully. After several years he left Rome and returned to his native country, where, having entered into holy orders, we suppose, he obtained through his uncle, the bishop of Warmia, a canonry at Frauenburg, in the enjoyment of which he passed the rest of his life. His working-day, it is said, he divided into three parts—one devoted to the duties of his office, another to giving medical advice gratuitously to the poor, and the third to study.

Soon after his return to Prussia, he began, in his 35th year (1507), to apply his fund of observations and mathematical knowledge to correcting the system of astronomy which then prevailed. The result was his *De Revolutionibus Orbium*, some account of which is given in the previous article. He completed it in 1530, in his 57th year. But though finished at this date, it was twelve years later before he could be persuaded to give his book to the world by his friends, who urged its publication out of regard at once to his fame and the interests of science. Perhaps the strongest motive for his reticence, was the fear of the unpopularity which the work threatened to bring him (for many who had heard of the views it advocated, doubted if these were in harmony with religion), while it is pretty certain that his desire to conciliate the church (which afterwards showed in the case of Galileo what it was capable of in such a matter), led him to

dedicate his book, when it was published, to pope Paul III. It is related that the first copy of this labor of his life reached him when he was no longer able to enjoy the triumph. An attack of dysentery, followed by paralysis of the right side, had destroyed his memory and obscured his understanding. In this state he lingered several days. The copy, it is said, just arrived a few hours before he died. It was placed in his hands, and he *seemed* to know it! He died 24th May, 1543, aged 70.

Besides the *De Revolutionibus*, may be mentioned among C.'s works a treatise on trigonometry, entitled *De Lateribus et Angulis Triangulorum*, Wittemberg, 1522, 4to; and *Theophylactici Scholastici Simocattæ Epistolæ Morales, Rurales, et Amatoriæ, cum Versione Latina*. He also wrote a work on money, and several MS. treatises from his pen are said to be in the library of the bishopric of Warmia. His life has been written by Gassendi. See also the life by Von Hipler (1873) and Polkovski's *Zywot Kopernika* (Warsaw, 1873).

COPI'AH, a co. in s.w. Mississippi, bounded on the e. by Pearl river, and intersected by the New Orleans, Jackson, and Great Northern railroad; 960 sq.m.; pop. '80, 27,544—14,438 colored. It is an agricultural region. Co. seat, Gallatin.

COPIAPO', a name of various application in the n. of Chili, marking at once a volcano, a river, a district, a village, and a city. 1. The volcano is a peak of the Andes, in lat. 27° 32′ south. 2. The river has a westerly course of 120 m. from the Andes to the Pacific; its mouth being in lat. 27° 20′ s., and long. 71° 2′ west. 3. The district, sometimes reckoned a part of the province of Coquimbo, is rich in silver and copper; but, excepting on the immediate banks of streams, almost valueless for agricultural purposes. 4. The village, known as Port C., stands at the mouth of the river, containing about 1200 inhabitants. 5. The city built on the river, about 30 m. from the sea, had in 1875 a pop. of 11,432. It is connected by railway with Caldera, a harbor of the republic, about 20 m. to the n. of the mouth of the river. The C. railway has 120 m. in operation. The shares owned by British subjects amount to the sum of $1,500,000. The exports from this region are copper, silver, cobalt, ore, and hides. The imports are almost wholly from the United Kingdom, consisting of coals, iron, bricks, machinery, etc. There is also some trade across the Cordillera with the Argentine provinces.

COP'LAND, JAMES, a distinguished physician, b. at Deerness, in the Orkneys, in 1792. After studying medicine at Edinburgh, he traveled on the continent, and subsequently undertook a journey to Africa, to investigate the nature of epidemic diseases prevalent in tropical lands. He settled in London about 1820, and was made a member of the royal college of physicians. In 1822, he undertook the editorship of the *London Medical Repository;* and being chosen in that year to deliver the annual oration of the London medical association, he in his lecture advanced a new theory of electro-galvanism. His *Outlines of Pathology and Practical Medicine*, in which he especially treated of the ganglionic nerves and their functions, and proposed a new and more simple classification of diseases, appeared in 1822, and the *Elements of Physiology* in 1824. But C.'s most important work was the *Dictionary of Practical Medicine*, four closely printed volumes, to which he devoted the labor of many years. This comprehensive work has attained an extensive reputation in America and Germany as well as in England. The views given in his essay on *Pestilential Cholera*, published in 1832, when the cholera first appeared in Britain, have been confirmed by experience. He also published, besides various contributions to medical periodicals, a treatise on palsy and apoplexy, and, in connection with Dr. Annesley, one *On the Diseases of Warm Climates*. He d. in 1870.

COP'LEY, JOHN SINGLETON, the father of the late lord Lyndhurst, and a historical painter of some note, was b. at Boston in the United States, July 3, 1737. In 1774, he came to England, and after a visit to Italy, settled permanently in London. In 1783, he was elected a member of the royal academy, and died in 1815. C.'s best work is the "Death of Lord Chatham," now in the national collection. Besides it, may be mentioned his "King Charles Ordering the Arrest of the Five Members of Parliament," the "Death of Major Pierson," the "Assassination of Buckingham," and "King Charles Signing Strafford's Death Warrant."

COPPÉE, HENRY, LL.D., b. Ga., 1821; graduated at West Point in 1845; served in the Mexican war, and as assistant professor at the military academy. In 1855, he was professor of English literature and history in the university of Pennsylvania. He has published *Elements of Logic; Rhetoric;* and *Grant and his Campaigns;* besides editing a number of eclectic compilations.

COPPER is one of the most anciently known metals, and its name is derived from the island of Cyprus, where it was first obtained by the Greeks. In the earlier times C. does not appear to have been employed by itself, but always in admixture with other metals, principally tin, forming what is now called bronze (q.v.). There is every reason to believe, that next to the large quantities of tin which they obtained, one of the great inducements which the Phenicians had in making searches for metals in Great Britain, was the C. which they procured in their workings in Cornwall.

C. is sometimes met with in nature in a state of purity, but generally it is associated with oxygen, water, and carbonic acid, forming the native carbonate of C. or *malachite* ($CuO,HO+CuO,CO_2$), or with iron and sulphur, forming the native sulphurets of C. and

iron or *C. pyrites* (Cu_2S,Fe_2S_3). In smaller quantity, C. occurs as the oxide (CuO), and sulphate ($CuOSO_3$), and in all cases the ore is obtained from fissures or veins in other rocks. The principal yield of C. ore in Great Britain is from the mines in Cornwall, but large supplies are also obtained from Australia, and from Cuba and Chili in South America. In North America, in the neighborhood of lake Superior, C. ore occurs abundantly, and a vein of metallic C. is there found which in some places is about 2 ft. in thickness.

In the extraction of C. from its ores, the metallurgic processes followed are very tedious and complicated, which mainly arises from the difficulty of separating the iron and sulphur from the copper. The general principle which regulates the working-up of the ore is to burn away the sulphur (S) as sulphurous acid (SO_2), and to carry off the iron by means of fluxes in the form of scoriæ or slag. Metallurgists enumerate ten distinct steps in the production of commercially pure copper.

C. (symb. Cu, from Lat. *cuprum*) has the equiv. 31.7—new system, 63.4. It is the only red metal, has the specific gravity 8.78 when cast, and 8.96 when rolled or hammered; fuses at 1996° F. (Daniell), and at a white heat passes off in vapor, and burns with a green flame. It is very malleable, and can thus be beaten out into thin leaves; is very ductile, so as to admit of being drawn out into thin wires; and its tenacity is only inferior to that of iron. It is a powerful conductor of electricity, and hence is employed in the construction of lightning-conductors, and in telegraph-wires for underground or submarine communication. C. is also employed largely in the sheathing of wooden vessels, and in the coinage. See also ALLOY.

C. forms many compounds. There are two oxides, the black oxide (CuO) and the red oxide (Cu_2O). The latter is employed in coloring glass of a ruby-red tint. The *green rust* which forms on the surface of a copper-sheeted ship, and on C. coins and vessels which lie in moist places for some time, is a carbonate of C., and is due to the carbonic acid and oxygen of the air acting upon the C. in the presence of moisture. It is very poisonous, and hence any barnacles which may attach themselves to the C. sheathing are poisoned. The carbonate of C., under the name of *blue verditer*, is largely prepared and sold as a pigment. The subchloride of C., moistened and exposed to the air, yields the pigment known as *Brunswick green*. There are several compounds obtained by allowing acetic acid to act upon oxide of C., which are commercially called *blue* and *green verdigris*. The sulphate of C., or *blue vitriol* (CuO,SO_3+5HO), is prepared by dissolving the black oxide in sulphuric acid, and allowing the salt to crystallize out. The crystals are large, and present a fine blue color. It is soluble in water, and is extensively used by the dyer and calico-printer for the production of several blue and green colors. The solution of blue vitriol is also employed in the preservation of timber from dry rot, and it forms a constituent of some writing inks.

Mineralogy.—Native C. is not of very rare occurrence; it is sometimes massive, or in grains, plates, etc.; sometimes crystallized in cubes or octahedrons; sometimes it assumes dendritic and other beautiful forms. Great masses of native C. have been found both in North and South America.—What are called C. ores in commerce, generally consist of the true ore disseminated through rock, and are therefore very variable in productiveness. A C. schist is profitably wrought at Mansfeldt, in Germany, although it yields only one per cent of copper. Among the most plentiful and valuable C. ores is the *C. pyrites* already mentioned, or *yellow C. ore;* but there is a richer ore called *purple C.* or *variegated C.*, or *bornite*, also a compound of sulphur, C., and iron. *Malachite* and *azurite*, both consisting essentially of carbonate of C., are valuable ores; as are some ores which are essentially composed of oxygen and C., particularly *red C. ore* (*cuprite*) and *black C. ore* (*tenorite*). Some ores of C. contain also silver, and some contain arsenic, antimony, etc. *Gray C. ore* is very compound, containing silver, mercury, zinc, antimony, arsenic, iron, and sulphur. *Atacamite*, wrought as an ore of C. in South America, is composed of chloride of C. and hydrochlorate of copper.

COPPER (*ante*). The principal deposits of copper in the United States are on the s. shore of lake Superior, where the metal occurs in mass among conglomerates and sandstones. It is almost wholly in the metallic or native state, running in veins across the strata, associated with spars and crystalline minerals. It is also abundant in beds of rock, and in such places the richest mines are found. In the beds generally the metal is found in small lumps or grains, but masses of pure copper of the weight of many tons have been found. In 1872, a single mine in this region yielded 8,000 tons of pure copper, or nearly one tenth of the production of the whole world. There is evidence that mines in this region were worked long before the arrival of the modern Europeans on this continent. The operations now going on were begun about 1845, and have increased largely from year to year. There are less important mines in Tennessee, Connecticut, New Jersey, Pennsylvania, and North Carolina.

COPPERAS is the commercial term for the sulphate of iron. See IRON.

COPPERED, COPPERING, in ship-building, are terms used in reference to the sheathing applied to the bottom of timber-built ships. The copper so used is in sheets, weighing from 18 to 32 ounces per sq. foot, and usually measuring 48 in. by 14. A layer of felt, paper, or coarse linen, is first applied to the planking; and the copper is nailed

down upon it. So much of the bottom as is immersed in the water is thus covered. The timbers are by this means protected from mollusks, cirrhopods, and weeds; and consequently the ship can sail quicker than if no such sheathing were applied. Some builders copper their ships up to the load water-line, while others go no higher than the light-load line; there being a difference of opinion whether the intermediate space, sometimes dry and sometimes wet, ought to expose a wood or a copper surface.

A *copper-bottomed* ship always ranks better at Lloyd's than one not so sheathed. The same is the case with a ship said to be *copper-fastened*, i.e., in which bolts of copper are used instead of iron in those parts of the ship immersed in water. Ships can be insured at a lower premium when thus provided.

COPPERHEAD, a serpent of the rattlesnake family, exceedingly poisonous. It grows to about a yard in length, is of light copper-color, with transverse bars, and is without rattles. Its bite is dangerous and often fatal. It is called "deaf adder" and "chunk-head."

COPPER INDIGO is an ore of copper found in spheroidal masses, of an indigo-blue color, in Thuringia and Vesuvius, and is very nearly pure sulphuret of copper. Its composition in 100 parts, is: copper, 64¾; sulphur, 32¾; iron, ½; and lead, 1.

COPPER-MINE RIVER—so named, in common with the mountains to the w. of it, from the metallic products of the vicinity—enters a bay of the Arctic ocean about lat. 68° n., and long. 116° west. Its overland discovery by lieut. Hearne, then of the Hudson's bay company's service, in June, 1771, excited considerable interest, as incontestably proving that the supposed strait of Anian, whatever might be the truth as to its westward terminus, had its eastward outlet, if any, only in the icy sea. The C. R. rises near a feeder of Great Bear lake, which itself is tributary to the Mackenzie—the former of the diverging water-courses taking a vastly shorter route to the coast than the latter. Hence the C. R. is throughout little better than a series of falls and torrents, being thus, even without regard to its isolated position, but little available in itself for navigation.

COPPERPLATE PRINTING. See ENGRAVING.

COPPER-SMELTING. I. The dry process.—The ores are sorted according as they contain much or little sulphur, and are mixed by the smelter to produce a mass, (1) that will contain 9 to 14 per cent of copper; (2) that after calcining will melt easily without flux; (3) that when fused will yield a mass containing about 30 per cent of copper; (4) that shall be free from impurities which would cause a low grade of copper. Three or four tons of this mixture are spread about 8 in. thick on the floor of a reverberating furnace. The fire is at first low; as the mass reddens the heat is increased, and the ore is stirred to expose all equally to the flame. The process lasts from 12 to 24 hours, depending on the quantity of silica and sulphur present. The sulphur is burned or volatilized, and the iron and sulphur pyrites are partly changed to oxides. After the calcined ore is removed from the furnace, water is added to assist oxidation, and the mass is stored for fusing. For this process, the calcined ore, with slag and broken bricks from old furnace hearths, is spread upon a reverberating hearth, the furnace is sealed with clay to exclude the air, and the heat is made intense for about 5 hours. The workman removes the slag which floats on the melted mass, and a second charge is usually added, melted, and skimmed: then the metal is run off into a pit of water, where it is granulated, or into molds, and afterwards crushed by machinery.

The processes of calcining and fusing are repeated, the first with moderate heat to consume the sulphur and oxidize the iron; the second with intense heat to remove the oxide of iron with silica in a slag, while the proportion of copper constantly increases. When the iron is mostly removed and the proportion of sulphur is much reduced, the metal is roasted in a current of air for about 24 hours, the mass being kept in a semi-fluid state. The product is a sulphide of copper, Cu_2S, which is at once submitted to another roasting for 24 hours, the product being nearly pure copper, which a subsequent refining fits for the market. The steps of reduction may be understood from the following table:

SUCCESSIVE ANALYSES IN REDUCTION OF COPPER.

Process.	Composition of Product.						Composition of Slag.			
	Copper.	Iron.	Ox. of Iron.	Sulphur.	Silica, etc.	Total.	Silica.	Ox. of Iron.	Ox. of Copper.	Alumina, Lime, etc.
Selected ore.....	12.3	32.7	.....	31.	24.	100				
1. Calcination.....	12.2	22.7	18.5	16.2	30.4	100				
2. Fusion.....	33.7	33.6	.....	29.2	.....	96.5	60.5	28.5		11.

4. Fusion.....	58.8	12.6	.....	20.5	8.1	100	45.	53.	2.	
5. Roasting.....	98.4	.7	...	.....	.9	100				

II. The wet process.—The ores are first burned to drive off part of the sulphur, which is utilized in the manufacture of sulphuric acid; about 30 per cent of the weight is removed. The remainder is mixed with about 15 per cent of common salt, and the whole is finely ground between heavy iron rolls. A portion of unburned, or over-burned, pyrites is usually added to bring the proportion of sulphur in the mass to the proper standard. The mass is then calcined, the sulphur is oxidized, sodic sulphate is formed, while the chlorine of the salt unites with the copper to form cupric chloride; the hydrochloric acid and other gases evolved are condensed in tall chimneys as "tower water," which is saved for use in the next stage of the process. The calcined ore is washed in tight wooden tanks, with hot water, "tower water," and dilute hydrochloric acid, until all soluble copper is extracted. The solution is conducted into other tanks of wood, containing heaps of old malleable iron, by which the metallic copper is precipitated in a finely divided condition. When a steel blade, thrust into the liquid, is no longer reddened, the process is ended; the tanks are drained, and the copper is separated from the iron by washing with water. This precipitate contains about 80 per cent of copper, which is further purified, as in the dry way. The liquid which contains the copper carries also the lead, silver, or gold which may have been associated with the copper in the ore, and these metals may all be profitably separated. About 14,000 tons of copper are produced annually by this process in Great Britain, out of a total annual product in the world estimated at from 126,000 to 130,000 tons.

CO'PRA, the dried kernel of the cocoa-nut, from which cocoa-nut oil has been expressed. It is much used in India as an ingredient of curries.

COP'ROLITES (from Gr. *kopros*, dung, and *lithos*, a stone) are the fossilied excrements of animals found in the secondary and tertiary strata of the earth's crust. Their true nature was first inferred from their occurrence in the bodies of several species of *ichthyosaurus*, in the region where was situated the intestinal tube. It has been since shown that they are the voidings chiefly of saurians and of sauroid fishes. They often contain portions of scales, bone, teeth, and shells, the indigestible parts of the food on which the animals lived. Occasionally, they may be found exhibiting the spiral twisting and other marks produced by the conformation of the intestinal tube, similar to what is noticed in the excrement of some living fishes. These peculiar markings obtained for them the name, when their true nature was unknown, of "larch-cones" and "bezoar-stones." C. are found to contain a large quantity of phosphate of lime; and as this forms a valuable manure, the deposits containing them have been of late years largely quarried by the manufacturers of artificial manures.

COPS, COPING (Anglo-Sax. *cop*, Germ. *kopf*, the head). The merlons or rising parts of battlements are sometimes called cops, but the term coping is usually applied to the covering course of a wall, which is made either sloping or round, so as to throw off water. Where the coping is of hewn stone, it is frequently ornamented with a circular molding running along the top, and sometimes the angle at the top is simply taken off to prevent it from being chipped.

COPSE, or COPPICE, a natural wood or plantation, of which the trees are cut over from time to time, without being allowed to attain the size of timber trees, sending up new shoots from their roots or stools. Some kinds of trees—as the firs—are incapable of being treated in this manner, refusing to send up new shoots; but many—as the oak, birch, chestnut, ash, elm, maple, alder, hazel, and willow—very readily do so, at least if they have not been allowed to attain too considerable a size before being cut over. C. woods are sometimes planted chiefly to vary and beautify the landscape, but more generally with a view to profit, either owing to great local demand for their produce, or to peculiarities of soil and situation. It often happens that, owing to scantiness of soil or to unfavorable subsoil, oaks and other trees, after growing vigorously for a number of years, are arrested, and remain almost stationary in their growth. In such circumstances, it is advantageous to cut them over early, and to treat the plantation as a C., the former vigor being again manifested in the young shoots, and the land yielding in this way a greater return to its owner. Oak is much planted as C. wood, in consequence of the demand for its bark: in some parts of Herefordshire, the trees are cut over every twelve years; but in the Highlands of Scotland, twenty-five or thirty years are often necessary for sufficient growth, nor is the bark thought to have attained its highest perfection till the stems are of this age. The largest pieces of the wood are used for making wheel-spokes, and for other purposes of timber; the smaller portions for charcoal and firewood. Ash is sometimes planted as C., with a view to the employment of the wood for handles of implements, hurdles, hoops, etc., the wood of the ash, even when very young, being highly valued for strength and elasticity. Chestnut copses are planted in England to supply hop-poles. Hazel is a very common C. wood, being in great demand for making crates, etc. Besides the cultivation of differeni kinds of willow or osier for basket-making, in which they are cut over annually, some of the species are cultivated as C., and cut every five, six, or seven years, for hoops, crates, etc.; the species which is deemed most suitable of all being *salix caprea*. See WILLOW. In some countries, C. wood is particularly valued for the regular supply of fuel which it affords.

In cutting C. wood, care is taken to dress the stools so that water may not lodge in them and cause them to rot. The size to which the stems are allowed to attain before

being cut, and the frequency of cutting, differ according to the different kinds, and the uses intended. Stems more than 4 in. thick are generally cut with the saw, but smaller stems with a curved bill, cutting upwards. Extensive copses are sometimes divided into portions, of which one is cut every year.

COP'TIS, a genus of plants of the natural order *ranunculaceæ*. *C. trifoliata* is a native of the n. of Europe, Siberia, Greenland, Iceland, and North America. It grows in swamps. From its long, thread-like, golden-yellow rhizomes, it derives the name of *golden thread*. Its leaves have three wedge-shaped leaflets, and its leafless stems bear each a solitary, rather pretty white flower.

COPTIS. Very similar to the *C. trifoliata*, noticed in the article COPTIS, is *C. teeta*, the *golden thread* of Assam, the root of which has long been in high repute in Assam and neighboring countries. It has come into extensive use in India as a bitter tonic, and is sold at a very high price. Great efficacy is ascribed to it as a tonic for patients beginning to recover; but it is of no value as a febrifuge.

COPTOS, the modern Kobt or Koft, a t. in Egypt, near the right bank of the Nile, 25 m. n.e. of Thebes. It is a place of great antiquity, but its ruins belong to a comparatively late period. After the foundation of the port of Berenice on the Red sea, 266 B.C., its position on the caravan line raised Coptos to great importance; but in 292 A.D., in consequence of joining in rebellion against Diocletian, it was almost destroyed. During a part of the 7th c. it was called Justinianapolis, in honor of the emperor Justinian.

COPTS, the Christian descendants of the ancient Egyptians. Various derivations have been given of the name, which, however, is most probably from the same root as E-*gypt*. The C. are in number about 150,000, only about a fourteenth of the population of the country. There are about 10,000 of them in Cairo. They are not of great stature, have black eyes and rather curly hair, and in a number of points resemble the ancient Egyptians, from whom also they have inherited the custom of circumcision. They dress like the Moslems, but are generally distinguished by a black turban. Their character is in general gloomy, deceitful, and avaricious. They are very expert in calculations, and are therefore much employed as accountants and book-keepers, by which they have acquired a great influence in the country, filling very important posts In religion they are generally monophysites (q.v.) of the Jacobite sect; smaller sections of them, however, are united to the Greek and Roman Catholic churches. They ascribe their conversion from heathenism to St. Mark, whom they regard as the first patriarch of Alexandria. Their highest dignitary is the patriarch of Alexandria, whose residence, however, is in Cairo. Their other orders of clergy are bishops, archpriests, priests, deacons, and monks. The patriarch is named by his predecessor from among the monks of the convent of St. Anthony, or chosen from among them by lot. He is not permitted to marry. He nominates the metropolitan of Abyssinia. See ABYSSINIA. There are twelve bishops. The C. are very strict in their religious observances, and hate other Christian sects even more than they hate the Moslems. They baptize by immersion; practice unction, exorcism, and auricular confession; and celebrate the Lord's supper with leavened bread which has been dipped in wine. They keep Friday with great strictness as a fast-day. They have many schools, but only for boys, who learn the Psalms, gospels, and apostolic epistles in Arabic, and the then gospels and epistles in Coptic. The Coptic, however, is not grammatically taught, and is not now a spoken language, having been everywhere supplanted by the Arabic. It has not been spoken in lower Egypt since the 10th c., but lingered for some centuries longer in upper Egypt. It is, however, still used by the C. in their religious services, but the lessons, after being read in Coptic, are explained in Arabic. The Coptic literature consists in great part of lives of saints and homilies, with a few Gnostic works. The alphabet was borrowed from the Greeks at the time of the introduction of Christianity, with the addition of a few letters. There are two principal dialects of the language—the Sahidic or upper Egyptian, and the Memphitic or lower Egyptian, which is sometimes exclusively called Coptic. A third dialect, the Bashmuric, of which only a few remains exist, was spoken in the delta, and is interesting from its points of resemblance to the language of the hieroglyphics.

COP'ULA (Lat. band), is a term employed in logic to designate the word which unites the two notions of a sentence—viz., the subject and predicate into one judgment or thought. Thus, in the sentence, "Art is long," *art* is the subject, *long* the predicate, and *is* the copula. The C. is either expressed apart by some part of the verb "to be," as in the above sentence, or it is contained in the word expressing the predicate—as, "The flower blooms"—i.e., *is* blooming.

COPY, in the fine arts, is a reproduction of a work, whether painting, statue, or engraving, not by the original artist. A C. made by the master himself is called a repetition (in French, a *doublette*). It is said that copies are of three degrees: first, where the original is mechanically imitated in its minutest details (this is always done when an engraving is to be obtained); second, where only the principal traits are imitated; and third, where the general idea merely is borrowed. A C. of a statue, or other piece of sculture, taken from a mold, is not called a C., but a *cast* (q.v.).

COPYHOLD, a species of estate or right of property in land in Ireland and England, nearly resembling in many particulars the feu-rights of Scotland. C. is expressed technically as "tenure by copy of court-roll at the will of the lord, according to the custom of the manor." This means, that it is tenure of land, being part of a manor, the title being evidenced by the court-rolls of the manor, and the right of the owner being in conformity with the immemorial customs of the manor. The addition, "at the will of the lord," serves only as a memorial of the derivation of this species of estate from the estates granted in old times to the bondsmen, or *villeins* (q.v.), which were of course resumable at the pleasure of the lord. But the will of the lord is now absolutely controlled by the custom of the manor, which forms the law of the tenure; and as this custom must be immemorial, i.e., extending to the reign of Richard II., no C. can now be created.

The custom of each manor may vary in important particulars. In some, the C. lands are held for life only; in some, they descend according to particular rules of their own; in most, however, they descend according to the ordinary rules of succession. But the custom, whatever it may be, cannot be altered by the holder of the C.; he cannot, for instance, entail his land unless the custom warrants him.

An important point, also dependent entirely upon special custom, is the amount of the money-payments due by the copyholder to the lord of the manor. These are divided into the *rents*, an annual payment of the nature of the Scottish feu-duty; *fines*, payments on particular occasions, such as alienation or succession; and *heriots*, or the best piece of personal property, to which, on the death of the copyholder, the lord becomes entitled. As to fines, it may be observed, that the custom may either fix the amount, or it may leave them to beat the pleasure of the lord; but as the courts of law require that all customs, even when indefinite, shall be reasonable, they have fixed the extreme amount that can be exacted at two years' rent of the land.

One practical distinction of much importance, drawn between freehold and C. land, is the mode in which it must be conveyed. An ordinary conveyance is ineffectual in regard to C., and indeed would operate, like other attempts to break through the custom which forms the title, as a forfeiture. The course adopted is almost identical with the Scottish *resignation*. The owner comes to the steward of the manor, and by a symbolical delivery, according as the custom may prescribe, surrenders the land to the lord of the manor, in order that it may be granted again to such person, and on such terms as are desired, and as the custom authorizes. The steward, by a repetition of the symbolical delivery, transfers the C. to the person in question, in terms of the surrender; and he then pays the customary fine, and takes the oath of fealty. This is called conveyance by surrender and admittance. In the case of an heir succeeding, there is no surrender, but there is admittance only upon payment of the customary fine, and it is enforced by a customary penalty. A mortgage is effected by a surrender, upon condition that the money is repaid, and the admittance takes place only in event of failure of payment. A C. may, in like manner, be devised by will, the devisee being admitted on the death of the devisor. A comparison between C. and the Scotch feu will be found in Paterson's *Compendium of English and Scotch Law*, p. 57.

The inconveniences and loss accruing through the variety of customs to which C. lands are subject, have led the legislature to make provision for their gradual extinction. By the copyhold commissioners, all the services due to the lord of the manor may be commuted for a fixed rent. The lord of every manor is also authorized to enfranchise, or convert into freehold, the C. lands by agreement with their owners. And after the next admittance subsequent to 1st July, 1853, either the lord or the tenant so admitted may compel enfranchisement on payment, either of a fixed sum, where it is at the instance of the lord, or of an annual rent, where it is at the instance of the tenant, fixed in both cases by the commissioners.

COPYING, a term applied in photography to the reproduction of paintings, engravings, manuscripts, maps, etc. The kinds of camera and lens most suitable for the purpose, will be found described under their respective heads; the quality and condition of chemicals necessary are based upon the facts, that long exposure is almost invariably required, and that, in the majority of cases, it is desired to copy black marks upon a white ground, as in a sheet of music, for example. Where it is obvious that nothing that can be called a middle tint is required, but simply pure black and white, recourse should be had to organic matter in the bath; a little acetate of soda, and an extra amount of acetic acid, may be also added, and an old collodion containing free iodine employed.

It is important that the work or surface to be copied should be placed in a strong light, and exactly at right angles to the axis of the lens, which should be furnished with a *small* stop. These three conditions, it will be seen, are such as are calculated to insure density in the blacks of the negative, freedom from distortion, and sharpness at the edges of the picture. The copying of oil-paintings seems to the amateur, at first sight, to present almost insuperable difficulties, on account of the reflected light from the varnish passing through the lens, and producing black patches on the negative. This may, however, be completely avoided by the employment of a lens of long focus, which admits of the oblique pencils of light passing off without entering the camera.

Attention to the laws of the reflection of light, will suggest to the reader the impor-

tance also of avoiding a bright light immediately behind the camera, as the rays of light would then fall on the varnished surface, nearly at right angles, and be reflected into the camera. The oil-painting, therefore, though placed in strong sunshine, for the purpose of giving vigor to the more obscure parts, should be so arranged as to allow the light to fall on it at an angle of about 35° or 40°.

In copying transparent negatives, a somewhat different arrangement is required, as will appear from considering the following facts. Every object to be copied may be regarded, for the sake of illustration, as an assemblage of bright points, from each of which divergent pencils of rays are reflected, and suffer refraction on passing through the lens; an engraving or oil-painting is, in fact, in its relation to the sensitive surface, the *source of light*. In a negative, however, many of the parts of which are transparent glass, it is manifest the case is different, for if we suppose the sun or a luminous background to be placed behind the negative, *that* will act as the source of light, and any rays coming therefrom will pass almost directly through those parts of the negative which are bare glass, to the lens; thus producing the same effect as if the transparent parts were opaque, but luminous, and emitted divergent pencils of light. It is necessary, therefore, that the rays should be made to intersect at those points where bare glass exists, and this may be accomplished by employing what is called a condensing lens, by which means negatives may be most successfully copied, by placing an artificial light behind it, or still better, by reflected sunshine through it.

Negatives are sometimes copied on glass by direct superposition in the ordinary pressure-frame, such as is used for printing photographs on paper, in which case, dry plates are used, prepared either by the albumen or collodio-albumen process; and the latent image so obtained yields a transparent positive when developed by gallic or pyrogallic acid.

COPYING-MACHINES. The various contrivances for procuring duplicates of writings without the labor of transcribing them, may be reduced to two classes. In the one, the writing is first made, and then copied; in the other, the copy and the original are produced at the same time. The essence of the first method is this: In writing the original, an ink is used that is made for the purpose, or common ink thickened by the addition of a little sugar. When the writing is dry, a damped sheet of thin unsized paper is laid upon it, and over this a piece of oiled paper. The whole is then subjected to pressure, and the damped paper is found to have taken off an impression of the writing. It is of course the reverse of the original, but the nature of the paper allows it to be read right on the other side. The machines for communicating the pressure are of various kinds. Some pass the sheets between rollers like the copper-plate press; others act on the principle of the common printing-press. A simple plan is to wrap the sheets round a wooden roller of about an inch diameter, lay this upon a table, and roll it under a flat board, pressing all the while. Another very common method of copying, is by means of prepared blackened paper laid between two sheets of thin writing-paper. The writing is traced firmly on the upper sheet, with a steel or agate point, or common black-lead pencil, and the lines are found transferred in black from the blackened sheet to the paper adjacent. By having several of these blackened leaves, a number of copies may be produced at once. The blackened paper is prepared by saturating it with a mixture of lard and lamp-black, and cleaning it so far that it will not soil paper unless pressed against it.

COPYING-MACHINES (*ante*). 1. *The Electric Pen*, invented by Thomas A. Edison. This is a metallic tube or style within which vibrates longitudinally a steel wire, pointed and protruding slightly at the lower end. The vibration is caused by an engine carried at the top of the style. Several motive powers are applicable, as compressed air, water, force communicated from other machinery, etc.; but as the most convenient and portable, Mr. Edison chose an electro-magnetic engine, actuated by a current brought from a small battery which stands on the table by the side of the writer. The engine having been started, and the wire vibrating at a rapid rate, the style is held vertically over the paper, and the point is moved upon the sheet as in the act of writing. The needle punctures a series of holes in the path over which the pen is carried, and the paper becomes a stencil, in which the writing readily appears when the sheet is held up to the light. This stencil is then laid upon a sheet of plain paper, in a frame which binds the two together; an inked roller is passed over it, and the ink pressed through the holes in the stencil appears upon the clean sheet in a series of minute dots in the line of the writing. With careful use a stencil will furnish 500 or more copies. After some copies have been taken, the stencil may be dried and kept for use again.

2. *The Papyrograph.* The patentee furnishes a specially prepared paper, upon which words are written with a common pen, but with a special ink. The sheet is then soaked in water, and the ink corrodes the fabric of the wet paper, leaving open lines in place of the writing. The sheet is then used as a stencil, like that prepared by the electric pen.

3. *The Gelatine Pad.* A simple, cheap, and effective copier may be prepared thus: Procure a shallow tin pan, one half an inch deep, and a little larger than a common cap or letter sheet. Soften 3 oz. of gelatine, white glue, or even common glue, by soaking

in cold water, and remove all the unabsorbed water. Boil for 1 hour in 10 oz. of glycerine, over a salt-water bath, and pour into the pan; when cold it is ready for use. In warm weather a larger proportion of glue is desirable. A special ink is necessary. Boil 1 oz. of violet aniline in 7 oz. of water; when cold, add 1 oz. of alcohol, ½ oz. of ether, ¾ oz. of glycerine, and 2 or 3 drops of weak carbolic acid. If this ink dries too quickly in the pen, add a few drops of alcohol. A good ink is made by dissolving 2 oz. of citric acid in 6 oz. of water, to which add 1 oz. of violet aniline. The writing to be copied is laid face downward upon the pad, and lifted again after a moment's delay, when a copy appears in reverse upon the jelly. A clean sheet laid upon this negative and instantly removed, shows a fac-simile of the original. Success depends much upon the quality and consistency of the ink. Ink made with black aniline will give about ten copies; with green, 30; with red, 60; and with violet aniline 100 to 125 fair copies have been taken. As soon as the copying is finished, the pad should be washed, using a soft sponge and clear water, warm preferred. The action of the pad is thus explained: The glue does not unite with the glycerine, but forms a spongy mass whose minute pores are occupied with the fluid. The aniline ink is absobed by the glycerine and given up successively to the sheets of paper, as they are laid down. Repeated washings wear away the pad. If its surface becomes injured it may be remelted, and more material added, at pleasure. Pads of this nature, made from various recipes, are sold under different names, but the materials and methods of use are substantially as described.

4. *The Blue Process* is peculiarly adapted to the reproduction of drawings, and is useful to architects, engineers, and artificers. Two solutions are prepared: the first contains one part of citrate of iron in four parts of pure water; the second contains one part of red prussiate of potash in six parts of water. When ready for use, equal parts of the solutions may be mixed in a shallow dish, and applied to sheets of paper with a sponge or a camel's hair pencil. Any paper will serve, but that is best which has but little sizing. The solution should be applied, and the paper should be dried and kept in the dark. The solutions themselves will keep, separately, in the dark as long as desired, but if mixed soon begin to deteriorate. The drawing or writing to be copied should be made with very black ink, upon paper or tracing cloth. A photographer's glazed frame, having a back easily removed, is useful for copying. Place the drawing face down upon the glass; the prepared paper with its face against the back of the drawing; put the movable back in place, reverse the frame, and expose to light. In direct sunshine, 2 to 7 minutes will be long enough, the time to be ascertained by trial; in diffused light, the exposure must be 5 to 10 times as long. After exposure the print should be immediately washed in a tub of clear water; when the chemicals are removed, the sheet is fastened by its corners to a line to dry, and the surface may be afterward finished by a hot iron, or by pressure. A little practice may be needed to secure the best results, in which the lines will be clear white, and the background a deep blue. A light blue background indicates a weak solution, or insufficient exposure; over-exposure is shown by a grayish tint. Clear, quick sunshine will give sharper lines than can be obtained by slow diffused light. The chemical change is evident; the light causes a reaction between the prussiate of potash and the iron, of which Prussian blue is the product; this occurs wherever the light has not been intercepted by the black lines of the drawing, which therefore appear in white upon an intensely blue and unfading background. Copies may be multiplied at will from negatives in collodion on glass, from engravings in books, from drawings, or from manuscript.

COPYRIGHT, an author's exclusive right of property in any work which he writes, and which, under certain limitations, is transferable to his heirs and assigns. Such is the chief or general meaning of the term, which now, however, embraces several varieties of right; and these, from the importance of the subject, we propose to consider separately.

Books.—The idea of a right of property in literary composition is of modern origin. Nothing is heard of C. previous to the invention of printing, nor for a long time afterwards. In ancient and mediæval times, books appear to have been transcribed freely by other parties than their authors, and as freely disposed of, often at great prices. After the introduction of printing, the liberty to publish books became the subject of licenses and patents; and these privileges may be said to have constituted a special monopoly of the nature of copyright. In the absence of any license or protection of this kind, authors could only resort to the common law to vindicate their real or fancied rights. But the common law of England was silent on the subject. There were serious differences of opinion among lawyers as to the availableness of an exclusive right in literary composition, viewing it as a chattel or thing that could be held, inherited, or assigned. How, it was asked, could ideas, or the way of writing a narrative, be made property? Supposing, however, that a certain structure of ideas and written words could be invested with the quality of property, it was reasonable to conclude that the property should be absolute and perpetual to the owner, his heirs and successors. Such being the case, it would be proper for the heirs of Shakespeare, Milton, Bunyan, and other literary luminaries of past times, to claim possession of the works of their respective ancestors; leaving them, of course, the right either to maintain a monopoly, or to suppress the works altogether. Such were the questions that puzzled the English

jurists of the early part of the 18th century. A compromise appears to have been made. No decision was come to as to whether literary composition was property in the ordinary sense of the word. Yet, looking at it as a thing on which thought and labor had been expended, and professedly "for the encouragement of learning," it was deemed worthy of legal protection for at least a period limited by considerations of public policy. An act of parliament was according passed on the subject in 1709.*

This, the first C. act, 8 Anne, c. 19, sets out as follows: "Whereas printers, booksellers, and other persons have of late frequently taken the liberty of printing, reprinting, and publishing, or causing to be printed, reprinted, and published, books and other writings, without the consent of the authors or proprietors of such books and writings, to their very great detriment, and too often to the ruin of them and their families: for preventing, therefore, such practices for the future, and for the encouragement of learned men to compose and write useful books, may it," etc. The chief provisions of the act were, (1.) That authors who, after April 10, 1710, had not sold their C. of works in print, were to have the sole right of printing them for 21 years; (2.) Authors of books not printed and published, and their assignee or assigns, to have the sole liberty of printing and reprinting such book and books for the term of 14 years, to commence from the day of the first publishing the same; (3.) After the expiration of the said term of 14 years, the sole right of printing or disposing of copies to return to the authors, if they were then living, for another term of 14 years.

Under this act, authors disposed of the C. of their works for the specified period, at the end of which, 28 years at most, the C. lapsed. Although the works might then have been considered public property, a custom arose among publishers of not interfering with each other's lapsed copyrights; and in a sense each assumed a kind of perpetual monopoly of the works which he had purchased for a terminable period. So stood matters, when Alexander Donaldson, an Edinburgh book-seller, of whom some notice has been taken in the article BOOK-TRADE, broke through the conventional regulations, by issuing cheap reprints of works out of copyright. There ensued a litigation, of which it is necessary to present some details. At divers times in 1729, James Thomson sold the C. of his *Seasons* and other poems to Andrew Millar, a London book-seller, for sums amounting to £242 10s. Thomson died in 1748. According to the act 8 Anne, c. 19, the utmost length to which the C. of these works could be extended was 28 years, which terminated in 1757. Millar died in 1768, and his executors, in 1769, sold by auction the C. of the works in question for £505. The purchasers were "Beckett and others." This sale was, in reality, an imposition; for, as just mentioned, the C. had expired in 1757. Aware of this fact, Donaldson, in 1768, issued a cheap edition of Thomson's *Seasons*. He was now challenged for an invasion of C.; and in 1771, Beckett and others applied for, and procured, an injunction from the court of chancery to restrain him from further printing and selling the work, and to make him answerable for the profits he had already realized. The only explanation of this extraordinary proceeding is, that the applicants for the injunction imagined that at common law they had acquired a property in Thomson's *Seasons* in all time coming. The question at issue was nothing less than the creation of perpetual monopolies in literature—not for the benefit of authors and their families, but for certain publishers and their assigns. The notion of a common-law right had prevailed in granting the injunction, and the validity of such a notion was now forever to be determined. Donaldson appealed to the house of lords. The chief points pressed for consideration were, whether at common law an author had the sole right of printing his works, and whether, possessing a right of that kind, it was taken away by the statute 8 Anne, c. 19. The lords differed in their opinion, but the decision finally come to was, that any right at common law was impeached and taken away by the statute; and the decree of the court of chancery was accordingly reversed. See Brown's *Parliamentary Cases*, vol. ii. p. 136. By this famed decision, it was settled that claims of C. rest altogether on the statute and its interpretations. Ever since, any one is at liberty to print and sell works of which the statutory term of C. has expired; on the simple ground, that all such works are public property.

The C. law did not extend to Ireland till after the union with that country, when (1801) the whole United Kingdom was included by the act 41 Geo. III. c. 107. Previous to this time, many of the most salable of the British C. works were freely reprinted in Dublin, and occasionally found their way across the channel to the annoyance of English authors and publishers. The next act concerning copyrights was that of 54 Geo. III. c.

* Until this act came into operation, the law of Scotland, as regards copyright, had been as defective as that of England. Under date Nov. 9, 1699, the following occurs in the *Domestic Annals of Scotland*, by R. Chambers, vol. iii.: "It was customary for the lords of privy council to grant exclusive right to print and vend books for certain terms—being all that then existed as equivalent to our modern idea of copyright. Most generally, this right was given to book-sellers and printers, and bore reference rather to the mercantile venture involved in the expense of producing the book, than to any idea of a reward for authorcraft. Quite in conformity with this old view of literary rights, the council now conferred on George Mossman, stationer in Edinburgh, 'warrant to print and sell the works of the learned Mr. George Buchanan, in one volume in folio, or by parts in lesser volumes," and discharged "all others to print, import, or sell, the whole or any part of the said Mr. George his works in any volume or character, for the space of nineteen years.'" Some other instances of the same kind are given, making it clear that in these times books could not be printed in Scotland without authority from the privy council.

156, in 1814, by which the period of C., instead of being 14 years, and contingently for 14 years more, was fixed to be 28 years certain, and for the residue of an author's life, if he were living at the end of the 28 years.

The impetus given to literature during the early part of the present century, by the popular and voluminous writings of Scott, Byron, Moore, Wordsworth, and others, along with the growing taste for reading among the middle and less affluent classes, greatly increased the market value of C. in every species of literary production. As a natural consequence, that kind of disinterestedness so strikingly demonstrated in Robert Burns, who could hardly be prevailed on to accept a few pounds complimentarily in requital for hundreds of the most beautiful lyrics, was no longer seen, on the contrary, it became a recognized principle that an author was entitled to regard the product of his brain as purely a mercantile commodity. At length, under an impulse communicated by the assigns of some valuable copyrights about to expire, and on the assumption of benefiting the families of certain popular writers, the legislature was induced to extend the term of copyright.

By the act 5 and 6 Vict. c. 45, called Talfourd's or lord Mahon's act, 1st July, 1842, the term of C. was extended as follows: "And be it enacted that the copyright in every book which shall after the passing of this act be published in the life-time of its author shall endure for the natural life of such author, and for the further term of seven years, commencing at the time of his death, and shall be the property of such author and his assigns: provided always, that if the said term of seven years shall expire before the end of 42 years from the first publication of such book, the copyright shall in that case endure for such period of 42 years; and that the copyright in every book which shall be published after the death of its author shall endure for the term of 42 years from the first publication thereof, and shall be the property of the proprietor of the author's manuscript from which such books shall be first published, and his assigns." In the case of subsisting copyrights, the term was to be extended to 42 years, except when they belonged to an assignee for other consideration than natural love and affection; in which case they were to cease at the expiration of the 28 years, unless their extension were agreed to between the proprietor and author. In this act, there is a remarkable clause giving power to the judicial committee of the privy council to license the publication of books of importance, which the proprietor refuses to republish after the death of the author. Formerly, there was an obligation on publishers to deliver 11 copies of new works to certain universities and other public institutions; the obligation was now modified to five copies. The importation of English C. works printed in foreign countries is prohibited. C. is declared to be personal property, and may be bequeathed as such; in case of intestacy, it is to be subject to the same law of distribution as other personal or movable estate. The old obligation to register the C. of new works at stationers' hall was also modified; registration is no longer obligatory, but the practice of registering is still requisite for the sake of evidence in making good claims of copyright. Forms of registration and assignment are given by the act, but the use of them is not indispensable. The law of C. makes no distinction between British subjects and aliens. A foreigner may own the C. of a work printed first in Great Britain; but neither he nor any other person could maintain a claim of C. in a work which had been previously issued in a foreign country with which there is no international treaty of copyright. Attempts are sometimes made to evade this, by issuing editions of a work simultaneously in the United States and England on the same day, so as to secure both British and American copyrights.

The ordinary process of stopping the issue of unauthorized reprints of C. works, which receive the name of pirated editions, consists, in the first place, in procuring an injunction from the court of chancery (if in Scotland, an interdict from the court of session), and of afterwards raising an action of damages at common law. On all that concerns prosecution, as well as for many details respecting C. in its different varieties, we refer to Godson and Burke's *Treatise on the Law of Copyright.*

Such is the history and general nature of the law of C. respecting books. The last-mentioned act, more explicit than previous statutes, remains the great charter on the subject. Unfortunately, it still leaves some defects which it would require a fresh law to remedy. The extension of C. for the assumed benefit of authors and their families, which is the leading feature of the act, must be pronounced generally worthless. In the great majority of cases, authors assign the C. of their manuscripts for a consideration to publishers, who, looking for remuneration within a reasonable length of time, cannot, and as a rule do not, give a higher price for a 42 than for a 28 years' copyright. The tendency of Talfourd's act is still more than ever to lock up copyrights in the hands of the original assigns, where they are apt to become torpid and useless. A remedy for this evil has lately been found in a practice followed by certain acute and enterprising publishers of cheap reprints. Buying up the unexpired copyrights of books which have gone somewhat out of notice, they issue them in a form suitable to the nature of their business; and such reanimated productions constitute no small share of the cheap volumes that invite public attention—the author and his heirs being not in the slightest degree benefited by the process of literary resurrection.

Extracts, Abridgments, etc.—C. in a book entitles the proprietor to prevent extracts being made from it; but in practice, short extracts for the purpose of criticism, as in

reviews, or for historical illustration, are tolerated. Unauthorized abridgments of C. works are deemed piracies, and their sale can be stopped. In such cases, however, the abridgment must show a clear adoption of the language or collocation of words of the original. It is now determined that no C. can be maintained in mere subject, information, or ideas. A writer may have put himself to great trouble to procure information on a particular subject; but the law does not recognize how information is procured. If a second writer use the information of the first (though that may have little regard to matters of fact), and make out of it a new work, there is no invasion of C. unless the words of the first have been at the same time taken. See preface to Napier's *Memoirs of Dundee.*

Encyclopædias, Periodicals, etc.—The C. of articles contributed for and included in encyclopædias, magazines, reviews, or other periodical works, and of books published in a series, was regulated by the act 5 and 6 Vict. c. 45. The C. of such articles, being paid for and assigned, belongs to the publisher, but he cannot publish them separately without the consent of the author. The author, however, may reserve the right of separate publication, and merely sell the right to use the article; but, should he republish any such article or articles, it may only be done in such a manner as not to prejudice the right of the original publisher.

Dramatic Pieces and Musical Compositions.—These, with right of representation and performance, are, by the act 5 and 6 Vict. c. 45, subject to the same C. as books. Strictly, a C. song cannot be publicly sung, or a tune publicly played, without the permission of the composer or his assigns. Verses must not be taken from a periodical or copyright work, and set to music for sale, without permission. A C. work of fiction may be dramatized without the consent of the proprietor, who has no statutory power to forbid the performance.

Lectures and Public Addresses remain the C. of the person delivering them. By 5 and 6 Will. IV. c. 65, printers and publishers are liable to a penalty for printing and issuing spoken addresses without the consent of the author. It is understood that no one is at liberty to take down a sermon as delivered by a clergyman, and publish it without permission; the act, however (§ 5), makes some exceptions: protection is not extended "to any lecture or lectures delivered in any university, or public school, or college, or in any public foundation, or by any individual in virtue of, or according to, any gift, endowment, or foundation." Under this permissive clause, it would appear that sermons delivered by clergymen of the established churches, in endowed places of public worship, are deemed public property.

Letters, and every kind of epistolary correspondence, are the property of the writer. The receiver of a letter may retain it for his own use, but, strictly, he cannot publish it without the permission of the sender or his heirs, neither can he sell it as a curiosity. The sale of letters of distinguished individuals is illegal, though ordinarily tolerated. See *Curtis* on the law of C., pp. 87, 89, et seq., and cases there quoted. As to the rule in this respect in Scotland, see the proceedings in the case of the *Scotch Thistle* newspaper, in Irvine's report of the trial of Madeleine Smith, pp. 93 and 305.

Newspaper matter is subject to the common law of C., but practically, and for mutual convenience, the intelligence in one paper is freely copied by the more respectable class of papers with, and in the less respectable without, acknowledgment. The taking of leading articles in the same manner might doubtless be checked; as would also be the unauthorized adoption of existing newspaper titles.

Engravings, Maps, Charts.—C. in these is secured by several acts, more particularly the 17 Geo. III. c. 57. The term of C. is 28 years. Each engraving or map must have on it the date of publication and name of publisher. Those who infringe C. forfeit the plates on which the pirated engravings or maps were printed; they forfeit also every pirated sheet, and 5*s.* for every print undisposed of. There is no C. in subject. Any one may invent or delineate and sell pictures from subjects in C. books, without challenge. It is understood that in painting a portrait, C. remains with the artist, although he be paid for the picture, and the purchaser cannot take copies without permission or assignment. C. as to paintings, however, is ill defined and defective, and an improved law on the subject is said to be under consideration. See DESIGN, under which head is also noticed the C. of models, sculptures, casts, patterns of carpets and paper-hangings, etc.

Copyright in the Colonies.—By the act 5 and 6 Vict. c. 45, the C. of books, etc., printed in the United Kingdom, is extended to all British colonies; and the Act 8 and 9 Vict. c. 93, concerning the trade of the colonies, absolutely prohibited these dependencies from importing pirated editions of C. works. Practically, this last recited act was unavailing. Large quantities of cheap reprints of British C. books continued to be imported from the United States into the British American possessions. Remonstrances against these irregularities at length led to some special legislation. It was ordained by the act 10 and 11 Vict. c. 95, that the colonies might respectively enact a law to enable them to import pirated C. works, on the plan of exacting a custom-house duty on such works, the proceeds to be handed to the proprietors of the said copyrights. Colonial laws were accordingly enacted, in nearly all the British colonies except Australia. But the provisions were found quite inadequate. In 1874, the Dominion of Canada passed an act, confirmed by the imperial parliament in 1875 (c. 53), for securing in Canada the

rights of authors, and for prohibiting the importation into Canada of any work for which copyright under the colonial act had been secured. By this act, if there is copyright in the United Kingdom in a book, the author becomes entitled to copyright also in Canada, and none but the owner can import into the United Kingdom any copies reprinted in Canada. A copyright for 28 years from the recording thereof is now secured in Canada to authors; and if the author, or his wife or child, is living at the end thereof, then, for 14 years longer, such copyright being recorded there with the minister of agriculture.

Copyright in the United States is well defined. The latest act of congress on the subject is that of the year 1870. C. can be secured by any citizen of the United States or resident therein, who is the author of any book, map, chart, dramatic or musical composition, engraving, cut, print, photograph, painting, statue, etc. The term of C. is 28 years from date of recording; but at the end of that term, the author if living, or, if dead, his widow or child, may record C. for an additional term of 14 years. In cases of renewal, record to be published in one or more newspapers. The first step in securing C. is to send a copy of the title of book or other article, or a description of the painting, statue, etc., to the librarian of congress before publication, and two copies of the book (a photograph in the case of paintings, etc.) must be sent to the librarian within ten days after publication. The librarian makes the proper record, receiving a small fee. It is requisite that notice of entry of C. be stated in each book or on each other article. All pirated copies of C. works are to be forfeited, independently of claims for damages by action at law.

Copyright in Germany was first regulated as respects duration by the confederation; a resolution of which, in 1837, fixed the duration of property in literary productions and works of art at 10 years; and another resolution in 1845, extended it to the lifetime of the author, and for 30 years after his death. The laws regulating the contract of an author with his publisher varied in the different states. In Prussia, when an author assigned a C. to a publisher without any special stipulation, the publisher was entitled to issue only one edition, the extent of which he might determine. But a distinction is made between reprints or new issues (*auflagen*) and new editions (*ausgaben*). In the case of the former, the publisher is left free, on condition that he shall pay to the author, should no agreement be come to between them, on the occasion of each new issue, half the sum which he paid him for the first. New editions, on the contrary, can be published by the first publisher only by entering into a new contract with the author, which must be given in writing. This privilege is limited to the author's life, though his children have a claim for a *honorarium* for each edition issued after his death. The rights of the publisher may be transferred, and those of the author descend to his heirs. When the rights which have been conveyed to the publisher terminate, the author becomes again the unlimited proprietor of the work. C. in Germany is now regulated by imperial legislation. By the *Reichs Verfassung* of 16th April, 1871 (art. 4), the protection of "intellectual property" (*der Schutz des geistigen Eigenthums*) was expressly included in the matters which were to be dealt with by the imperial parliament.

Copyright in France exists in the author and in his widow for life, in his children for 20 years, and in his other heirs or assignees for 10 years after his own death or that of his widow. In *Belgium* the same law prevails, with this exception, that the right, whether in children or in other representatives, extends to 20 years after death.

International copyright is a mutual convention between two countries to protect each other's C., translations included. The United Kingdom made such arrangement with Spain, Austria, Belgium, Saxony, Prussia, France, Italy, etc. The United States have ever refused to enter into any international law of C. with Great Britain; a circumstance, as is understood, imputable chiefly to the opposition of the leading publishers of pirated editions of British C. works.

The late Right Hon. James Wilson contemplated a consolidation of the C. laws, and such a measure is certainly very desirable. Amongst improvements required may be cited the following: 1. An improved system of registration. As matters are now conducted at the stationers' hall, any person may make any entry he pleases, with very little check in case of false pretension. A reform in this particular should embrace a system of registration in Edinburgh, and also in Dublin, as well as in London, for the convenience of the three sections of the United Kingdom; the registrar of each section to get copies annually of the other registers for general inspection. 2. A clearer understanding of the posture of articles contributed to periodicals, encyclopædias, etc. It would probably answer the main purposes of justice, if the proprietor of the work contributed to were held as having, by his stipulated payment, acquired the C., unless where a special reservation was made. 3. A protection to publishers for literary services paid under a salary. It is clearly absurd to expect that each particular article, or, say, addition to a formerly existing book, written in these circumstances, should be matter of formal assignment; and in practice no such assignment takes place. Yet, with authors disposed to take advantages, there may be cases in which the honorable understanding as to the sufficiency of salary may be no protection to the publisher from at least a harassing litigation. 4. A remedy for the great mistake made in Talfourd's act, in the extension of copyright. By making this extension only to the representatives of authors who had not parted with their copyrights, the real objects of the act would be secured, and

an additional inducement to produce on the part of literary men would be established. See BOOK-TRADE. W. C.

COQUEREL, ATHANASE LAURENT CHARLES, a minister of the reformed church in Paris, and one of the most celebrated pulpit orators of France. He was b. in Paris in 1795, and studied theology at Montauban. Afterwards, he became minister of the French church in Amsterdam, where he remained 12 years. In 1830, Cuvier induced him to return to Paris, where, till his death, he held the office of a preacher of the gospel. In 1848, he was elected a delegate to the national assembly by the department of the Seine, but he did not appear to much advantage either in this assembly or in the legislative assembly, of which he was also a member. He wrote many works on religious subjects, history, and literature, all of which are marked by an earnest and liberal spirit. By the more rigidly orthodox of his co-religionists, C. was regarded as a heretic. He died 20th Jan., 1868.

His son, ATHANASE JOSUÉ LAURENT, also a Protestant pastor of liberal tendencies, died in 1875.

COQUIL'LA NUT, the fruit of a palm, *attalea funifera*. See ATTALEA. It now forms an article of export from South America, being used to a considerable extent in Britain in the manufacture of buttons and in turnery, as for making knobs of walking-sticks, umbrella handles, handles of bell-pulls, etc. It is very hard, susceptible of a good polish, and beautifully mottled with dark and light-brown. The demand for coquilla nuts seems likely to increase; and probably the fruits of some other palms may be found suitable for similar purposes.

COQUIM'BO, the name of a river, department, and city of Chili.—1. The river, rising in the Andes, enters the Pacific about lat. 29° 55′ s., and long. 71° 25′ w., and forms, at its mouth, one of the best harbors in the republic.—2. The department, extending in lat. from 25° 30′ to 31° s., and in long. from 69° to 72° w., occupies the entire breadth of the country between Aconcagua on the s. and Atacama on the north. With the exception of the immediate banks of streams, it is parched and barren, being valuable chiefly for its mines of silver and copper. Physically, the region here and there presents galleries of shingle-terraces with organic remains. See CHILI. The pop. in 1875 was 157,463.—3. The city stands at the entrance of the river, and contains about 6,000 inhabitants. In addition to copper and silver, it largely exports chinchilla skins. The copper exported in 1873 amounted to 15,000 tons, of the value of £1,125,000. It goes mainly to England.

COQUI'TO, *Jubæa spectabilis*, a beautiful Chilian palm, of the same tribe with the cocoa-nut, rising with a naked stem to the height of 40 or 50 ft., and bearing a crown of wide-spreading pinnated leaves. By cutting off the crown, the sap is obtained in great quantity, continuing to flow for months; and when boiled down to the consistence of treacle, becomes a very sweet sirup, and forms, under the name of palm-honey (*miel de palma*), an article of great importance in the domestic economy of the Chilians.

CO'RA, CO'RÉ, or CO'RI, a t. of s. Italy, 30 m. s.e. of Rome. It is most picturesquely situated on a commanding elevation in the midst of olive-plantations, and crowned by the ruins of ancient temples. Two torrents dashing through deep ravines on the e. and w. side of the hill add romance to the situation. The town, divided into an upper and lower part by an olive-grove, is surrounded by walls, chiefly of 15th c. date, and is on the whole well built, clean, and healthy, with a population of 6,000. C. preserves the name, and occupies the site of one of the oldest cities in Italy. Virgil and Diodorus make it an Alban colony, while Pliny ascribes to it a Pelasgic origin. In any case, it was early one of the most important cities of Latium. The ancient remains still existing—including those of the old walls, a Doric temple called the *Temple of Hercules*, a Corinthian temple, consecrated to Castor and Pollux, and a fine bridge—are among the most interesting in Italy.

CORA'CIAS. See ROLLER.

COR'ACLE. See CURRACHS.

CO'RACOID BONES. In the mammalian skeleton, the scapula or blade-bone presents a projecting bony process termed the coracoid process, from its supposed resemblance to a crow's beak (Lat. *kŏrax*, a crow); and from the idea that the bones which we are now describing, and which exist in all birds, in saurian and chelonian reptiles, and in the monotremata, correspond anatomically with the comparatively slightly developed coracoid process, they have received the name which is now universally assigned to them.

As the uses of these bones are most obvious in birds, we shall confine our remarks to this class of animals. It is obviously necessary that the scapular arch should be very strong in birds, in order to form a solid resisting fulcrum to the powerful movements of the humerus and other wing-bones. The scapula is a long, curved, compressed bone, extending along the back on each side of the dorsal vertebræ, imbedded in the muscles to which it gives attachment, while at its fixed extremity it assists in forming the cavity of the shoulder-joint. The coracoid bone is the great support of the shoulder; for while at one extremity it sustains the wing, at the other it is firmly secured to the sternum by a broad and strong articulation; indeed, it forms the main resistance to the approx-

imation of the humerus to the median plane, and retains it firmly in its lateral position. The scapula and coracoid bone are anchylosed (or united by osseous matter) at their point of union, thus forming collectively the structure popularly known as the side-bone. The clavicles, which are conjoined to form the furcula, combine to add to the stability of the whole apparatus.

CORAÏS, ADAMANTIOS, called by the French CORAY, one of the most learned Hellenists of modern times, and a great benefactor of his nation, was b. at Smyrna on 27th April, 1748. His father was a merchant, and he for some time also engaged in mercantile pursuits; but having from his earliest youth delighted in the study of ancient and modern languages, he relinquished business and devoted himself to literature. He fixed his residence in Paris, and there continued to reside till his death on 6th April, 1833. He published editions of many ancient Greek authors, adding notes and prolegomena, in which his patriotic zeal was often very strongly displayed. He translated into modern Greek the work of Beccaria, *Dei Delitti e delle Pene;* and by various translations and other publications, exercised a great influence in awakening the minds of his countrymen. When the Grecian war of independence began, C. was too aged to take any active part in it, but by his writings he showed his sympathy with the cause of his country.

CORAL, a calcareous secretion or deposit of many kinds of zoophytes (q.v.) of the class *anthozoa,* which assumes very various, and often beautiful forms, according to the different laws which govern the gemmation of the polyps of the different species. The C. producing zoophytes are compound animals, which increase by gemmation, young polyp buds springing from the original polyp, sometimes indifferently from any part of its surface, sometimes only from its upper circumference, or from its base, and not separating from it, but remaining in the same spot, even when the original or parent polyp has ceased to exist, and producing buds in their turn. The calcareous deposition begins when the zoophyte is still a simple polyp—owing its existence to oviparous reproduction—adhering to a rock or other substance, to which the calcareous matter becomes affixed, and on which the C. grows or is built up, the hard deposits of former generations forming the base to which those of their progeny are attached. One layer of the calcareous polyp cells of which the greater number of corals are composed, occasionally surrounds another like the concentric circles in the wood of exogenous trees; one layer is sometimes deposited above another; the whole structure sometimes branches like a shrub, spreads like a fan, or assumes the form of a cup, a flower, or a mushroom. Under the common name C. are included many species, also designated madrepores (q.v.), and some have received other names derived from peculiarities of their form and appearance, as brainstone C. (q.v.), etc. In the greater number of kinds, besides the calcareous plates which form and separate the polyp cells, and which are variously arranged according to the form and structure of the polyps themselves, there is a more solid internal or central calcareous part, formed by the additional deposition of calcareous matter at the bottom of each polyp cell, or from the common living part in which the polyps are united. The calcareous framework is further strengthened by a greater or less mixture of horny animal matter with the pure calcareous substance. This calcareous framework is analogous to the cartilaginous, leathery, or fibrous framework of many other compound zoophytes, as *alcyonium* (q.v.), or *dead man's fingers.* The polyps of the common RED C. (*corallium rubrum*) indeed very much resemble those of *alcyonium;* but the central axis in this and other corals forming the family *corallidæ* is quite solid, being produced in concentric layers by the living gelatinous substance, which envelops it like the bark of a tree, and from which the polyps project like buds, or, when their tentacula are expanded, like little flowers. In the *madreporidæ,* the general structure more nearly resembles that of *alcyonium.* Many of them, however, have the whole calcareous framework covered as in the *corallidæ,* by a gelatinous living substance which unites all the polyps. The whole living part soon decomposes and disappears, when the C. is taken out of the water; in some species, almost immediately running from the calcareous part as a watery slime.

Corals chiefly abound in the seas of the warmer latitudes, where they form extensive banks at no very great depth, and their various and bright colors present the appearance of submarine flower-gardens. Numerous species are usually combined in the formation of a single C. reef, and respectively occupy different places in it. Corals of the branching genus *porites* usually occupy the exposed edge of the reef, and with them is associated *millepora complanata,* a species which forms thick vertical plates, united at different angles by their edges, the outer plates only being tenanted by living polyps. In the stiller water within are many more delicate kinds, and in the quiet sheltered depths, brainstone corals and flower-like forms appear.

The C. of commerce, or common RED C.—so much admired for its fine color, susceptible of a high polish, and much used for ornamental purposes—is chiefly obtained from the Mediterranean, in some parts of which extensive "coral fisheries" are carried on. It is brought up from considerable depths by means of a sort of grappling apparatus dragged after a boat or boats; the pieces being broken from the bottom by beams of wood which are sunk by weights, and then entangled among hemp. Red C. has a shrub-like branching form, and grows to the height of about one foot, with a thickness

like that of the little finger. Much of the C. of the Mediterranean is exported to India, but red C. is also obtained in the Red sea, the Persian gulf, etc.—BLACK C. (*antipathes*), the axis of which is rendered still more solid by the greater mixture of horny with calcareous matter, is still more highly prized. C. was known to the ancients, and was used for ornamental purposes by the Gauls.

CORAL FLOWER, or CORAL TREE, *Erythrina*, a genus of trees and shrubs, of the natural order *leguminosæ*, suborder *papilionaceæ;* of which the species, natives of tropical and subtropical regions, generally produce long spikes of beautiful flowers of a rich dull crimson or a scarlet color, resembling coral. The leaves have three leaflets. The *standard* of the flower is remarkably long. The C. F. of Brazil (*E. crista galli*) is common in British green-houses. The Indian C. F. (*E. Indica*) is used in the East Indies for hedges, its stem being covered with thorns. The wood is so light and spongy that it is used for the largest sizes of corks.—*Jatropha multifida*, a very different plant, of the natural order *euphorbiaceæ*, has also acquired the name of coral tree.

CORAL ISLANDS exist most abundantly in the tropical and sub-tropical parts of the Pacific ocean. The formation of coral goes on, in favorable circumstances, with wonderful rapidity, for masses of coral have been found to increase in height several feet in a few months; and a channel cut in the reef surrounding a coral island, to permit the passage of a schooner, has been choked up with coral in ten years. It was at one time supposed that the coral polypes began their labors at the bottom of the ocean, and reared their pile from its greatest depths; but it has been ascertained that none of them live at depths of more than 20 or 30 fathoms, and most of them are inhabitants of much shallower water. It appears, therefore, that the foundation of their still marvelous structures must be on rocks that do not reach the surface, probably in most cases volcanic rocks similar to those which, being further upheaved, form the volcanic and often mountainous islands of Polynesia. Around these volcanic islands, which—although some of them are the largest islands of the Pacific ocean—are far fewer in number than its C. I., a fringing reef of coral is often found immediately attached to the land; whilst in many other cases, the reef surrounds the island, the intervening space—of irregular, but nowhere of great width—forming a lagoon or channel of still water, protected by the reef from winds and waves. According to a theory proposed by Mr. Darwin, and now very generally accepted, this latter kind of reef is formed from a reef of the former or merely fringing kind, by the gradual subsidence of the rocky basis carrying down the fringe of coral to a greater depth; whilst the greatest activity of life is displayed by polypes of the kinds most productive of large masses of coral in the outer parts which are most exposed to the waves. In this manner also he accounts for the formation of true C. I., or *atolls*, which consist merely of a narrow reef of coral surrounding a central lagoon; and very often of a narrow reef—perhaps half a mile in breadth—clothed with luxuriant vegetation, bordered by a narrow beach of snowy whiteness, and forming an arc, the convexity of which is towards the prevailing wind, whilst a straight line of reef not generally rising above the reach of the tide, forms the chord of the arc. There is generally a navigable passage through the reef into the inclosed lagoon, the waters of which are still and beautifully transparent, and the depth of water close to the precipitous sides of the reef is almost always very great. The passages through the reefs surrounding the larger volcanic islands are often opposite to the months of streams; but even where this is not the case, there is a strong current in these channels from the flux and reflux of the tides. Islets bearing a few cocoa-nut trees often appear at intervals in the line of a low coral reef, and very generally mark the sides of passages through it. When a reef has reached the surface of the water, sand, shells, fragments of coral, and other substances, begin to accumulate, and cocoa-nut trees often grow where the waves still wash their roots. Further accumulations from the ocean, with decayed leaves, stems, etc., gradually convert the reef into fertile land. Many C. I., of considerable extent and population, are nowhere more than a few feet above the level of the sea. Sometimes a volcanic upheaval seems to have taken place after the coral was formed, and this is supposed to have been the origin of the islands—comparatively few in number—called *crystal islands*, composed of coral rock, more or less modified by the action of air, water, and other agents. Islands of this class sometimes rise to an elevation of 500 ft., and often exhibit precipitous cliffs, and contain extensive caverns. They do not exhibit, however, the picturesque beauty of the volcanic islands, nor the soft and gentle loveliness which often characterizes the true C. I., and which has received the enthusiastic praise of all voyagers in the south seas.

Coral reefs sometimes include within their circuit more islands than one. Reefs also sometimes extend to a great length in a straight line, generally parallel to a coast, the submergence of which they are supposed to indicate. There is such a reef on the e. coast of Australia, extending not less than 350 m., without being broken by a channel.

COR'ALLINE, *Corallina* and *Corallinaceæ*, a genus and family of marine *algæ*, of the sub-order *ceramiaceæ*, remarkable for rigidity, which is mostly owing to a calcareous incrustation. When the calcareous matter is removed by a weak acid, the resemblance to other *ceramiaceæ* becomes very apparent. The common C. (*C. officinalis*), extremely abundant on the British coasts, at first appears as a thin, round, shelly, purplish patch, on a smooth rock, the shell of a mollusk, or the frond of a sea-weed, gradually enlarges.

and usually sends up a frond of jointed branching filaments, in a bushy tuft, an object of great beauty in the rock-pools. Although, as its name imports, this C. was once *officinal*, it has no medicinal virtues. Some of the corallines expand into leafy lobes, usually fan-shaped. Corallines are most abundant in tropical seas, and there display their greatest beauty.

The name C. is often popularly given to zoophytes of the class *anthozoa*, and genera *sertularia, thuiarea, antennularia, plumularia, laomedea, campanularia*, etc., having branching polypidoms and hydraform polypes of which the British coasts produce many small but extremely beautiful species.

CORAL RAG, a group of the Oxford or middle oolite (q.v.), consisting of continuous beds of petrified corals of very variable thickness, interstratified with beds of oolitic limestone. These strata occur in the northern districts of Berkshire and Wilts, and again, with the same characteristics, in Yorkshire, while in the intermediate district the whole group seems to disappear. It attains to a maximum thickness of 190 feet. The corals retain the position in which they grew at the bottom of the sea; they sometimes form masses 15 ft. thick. The characteristic genera are *isastræa, thamnastræa*, and *thecosmilia*. With them are associated the remains of mollusca and echinodermata.

CORAL SEA, so called from the substance of its numerous reefs, is that section of the Pacific which stretches between Australia on the w. and the New Hebrides on the east. Its general depth must be very considerable, for soundings of 2,150 fathoms, or nearly 2½ m, have been obtained in lat. 13° s., and long. 162° east.

CORAM, THOMAS, 1668–1751; an English philanthropist who began life as a seaman and rose to be a merchant captain. He settled in Taunton, Mass., where he was for several years engaged in farming and boating. In 1703, he returned to England, where, after long exertion and waiting, he established a hospital for foundlings, opened in Holton Garden, Oct. 17, 1740, with 20 inmates. Coram was also one of the promoters of English settlement in Georgia and Nova Scotia; but the hospital and other charities took the most of his attention, and on them he spent all his estate, so that in his old age an annuity was settled upon him by private subscription.

COR'ANACH, CORANICH, CRONACH, etc., a funeral dirge, formerly in use among the Irish and Scottish Celts. The word is probably derived from the Gaelic *cornh-rànaich*, a crying together. "The cries (coranich) are called by the Irish the ulagohne and hululu, two words extremely expressive of the sound uttered on these occasions (funerals); and being of Celtic stock, etymologists would swear to be the origin of the *ololugon* of the Greeks, and *ululatus* of the Latins."—Pennant's *Tour*.

The C. seems to be identical with the Irish *caóine*, generally written and pronounced *keen*, a dirge for the dead, "according to certain loud and mournful notes and verses," wherein the pedigree, property, the good and great deeds of the deceased, and the manner of his death are recounted, in order to excite sorrow or revenge in the hearers, and to show them the loss they have sustained.

The word, in one or other of its forms, occurs in the writings of many of the ancient Scottish authors:

"Cryand for you the cairfull corrinoch"
Sir D. Lindsay.

"Cyrand the corynoch on hie."
Battle of Harlaw.

"Be he the correnoch had done shout."
Dunbar.

The C. has long since fallen into disuse among the Highlanders. The funeral lament performed on the bagpipes, which may be considered as an instrumental C., lingered on till the latter half of the 18th century.

For specimens of the C., see sir Walter Scott's *Lady of the Lake*, and accompanying notes; Crofton Croker's *Researches in the South of Ireland;* and *Blackwood's Magazine*, vols. xiii. and xxiii.

COR ANGLOIS, a wind-instrument of the reed species, the body of which is bent in the form of part of a circle. It is just a large oboe, and played on by oboe-players. Its compass is from F, fourth line in the bass, to B flat above the treble staff. Music for this instrument is written a fifth above the real tones.

CORA'TO, a large t. in Southern Italy, province of Bari, 25 m. w. of Bari, is situated on a fertile plain, where much cattle is reared. Pop. '72, 26,220. It is an ugly, dirty town, although it boasts of having been founded by the Normans. It has a fine church, fine convents, and an orphan asylum. It was between C. and Andria that the famous "challenge or tournament of Barletta" took place between 13 Italians and 13 Frenchmen on Feb. 13, 1503, in which the Italians were victors.

CORAY', ADAMANTIUS, 1748–1833; a Greek scholar, the son of a merchant of Smyrna. He studied medicine in France, and being poor was obliged to support himself by translating English and German works into French. In Paris, in 1788, he published a number of political tracts looking towards the liberation of his countrymen from Turkish control. Napoleon employed him to translate Strabo, and gave him a

pension. The most celebrated of his works are the editions of the *Ethics* and *Politics* of Aristotle.

CORBAN, a gift or oblation to God, on pretense of which a person might reserve from sons or parents the use of property. Property so dedicated went into the keeping of the Pharisees of the Jewish temple. They held that no matter how rashly such a dedication was made, the act released the person from any duty to aid another with what he had so devoted.

CORBAUX', FANNY, b. 1812; an English painter and scholar. The failure of her father reduced her to poverty when but a child. She determined to make her way as a painter, and although her own instructor, she soon achieved a good position, excelling in portrait-painting particularly. She also became an excellent Biblical scholar, and wrote a series of letters on the *Physical Geography of the Exodus*.

CORBEIL, a t. in France at the head of an arrondissement in the department of Seine-et-Oise, at the junction of the Essonne with the Seine, 18 m. s.s.e. of Paris; pop. '72, 6,016. From the 10th to the 12th c. it was the chief town of a powerful countship. It was besieged by the duke of Burgundy in 1418, by the Huguenots in 1562, and by Alexander Farnese in 1590. The church of St. Spire was rebuilt in the 15th c.; St. Jean-en-l'Isle belonged to the templars, and dates from the 13th century. In the modern town there are more than 40 flour-mills, and many printworks, cotton factories, etc.

COR'BEL (Fr. *corbeille*, a basket). In architecture, this term, adhering originally to its etymological meaning, signified an ornament in the form of a basket, like those sometimes set on the heads of caryatides. In Gothic architecture, to which it is now almost peculiar, it is applied to any kind of ornamented projection used for supporting pillars or other superincumbent weights. Here also its form probably was at first that of a basket projecting from the wall, in which the end of the pillar was placed, and on which it rested. Latterly, the more ordinary form was that of a head, with the face looking outwards or downwards. In this form it is found in all the styles. A recumbent animal, again, is sometimes placed under the pillar, and there are a great variety of other forms. When any construction is carried out, so as to rest on corbels, and to project beyond the face of a wall, it is said to be *corbelled out*. See BRACKET, CANTALEVER, CONSOLE.

COR'BIE, a heraldic term for a raven. See CORBIE-STEPS.

COR'BIE-STEPS, or CROW-STEPS (Fr. *corbeau*, Lat. *corvus*, a crow). The word corbie or corby, though obsolete in English, except as a heraldic term, has retained its place in the Scottish dialect, and in architecture corbie-steps signify the succession of steps with which the gables of old houses are everywhere ornamented in Scotland. The fashion, like most of the other peculiarities of Scottish architecture, was no doubt borrowed, as was the term, from France. In the domestic buildings of Edinburgh, it is found in the highest degree of prevalence between 1620 and 1640. The notion, of course, was that the steps were for the use of the crows. This gable ornament is by no means peculiar to France, but is met with in Flanders, Holland, and all over Germany.

COR'BOULD, EDWARD HENRY, b. 1815; son of Henry, and also an artist. At an early age he painted "The Fall of Phæton from the Chariot of the Sun," for which he received a gold medal from the society of arts. Since that period he has produced a great number of large pictures. In 1851, he was appointed instructor of historical painting to the royal family. He paints exclusively in water-colors, and excels in pageants and chivalric subjects.

COR'BOULD, HENRY, 1787–1844; an English artist and one of the most accomplished draughtsmen of his time. He devoted a great part of his life to drawing from ancient marbles in the British museum and in various private collections.

COR CAR'OLI. See CONSTELLATION.

COR'CHORUS, a genus of plants of the natural order *tiliaceæ*, having five sepals, five petals, numerous stamens, and a capsule; and containing a number of species, both shrubby and herbaceous, natives of the warm parts of the globe. *C. olitorius* is widely diffused in tropical countries, and is supposed to be a native of Asia, Africa, and America. It is an annual, with a smooth, more or less branching stem; varying in height from 2 to 14 ft. or upwards, according to soil and climate. It has smooth, stalked, alternate, oval, or ovato-lanceolate leaves, and small yellow flowers, solitary or in pairs on foot-stalks. It is much used as a pot-herb, and is called JEWS' MALLOW, from being much cultivated by Jews in Syria and other parts of the east. It is still more valuable for the fiber of its inner bark, as is also *C. capsularis*, a species very similar, but distinguished by the want of transverse partitions in its capsule. Both are much cultivated in India, yielding the greater part of the JUTE (q.v.) of commerce, and of the fiber employed in making *gunny bags* (q.v.). *C. capsularis* being extensively cultivated in China, is sometimes called CHINESE HEMP.

The Japanese shrub, now very common in Britain, and still very generally known as *C. Japonicus*, was ranked in this genus when botanists were very imperfectly acquainted with it, but belongs to the genus *kerria*, of the natural order *rosaceæ*.

CORCY'RA. See CORFU, *ante*.

CORDAGE, a seaman's name for the running rigging of a ship, as distinguished from the standing rigging. The name is also given to the store of rope kept in reserve. See RIGGING, ROPE.

CORDAY D'ARMANS, MARIE ANNE CHARLOTTE, known as CHARLOTTE CORDAY, was b. at St. Saturnin in the department of Orne, in 1768. Though descended from a noble family, she early imbibed revolutionary principles, but was horrified at the monstrosities of the Jacobins; and her hatred of their acts was intensified by converse with a party of proscribed Girondists, who had fled to Normandy. She resolved to rid her country of one of the principals of the Jacobin faction, and with that view traveled to Paris. Whether to slay Robespierre or Marat, was an open question with her; but while she was debating the matter with herself, a demand of the latter for a hundred or two hundred thousand more victims for the guillotine, marked him out for her weapon. Twice she sought admission to Marat unsuccessfully, but on a third occasion (July 13, 1793), was admitted on the plea that she had important news from Caen to communicate. She found Marat in his bath, who, to some statement she made, declared that the Girondists who had fled to Normandy, some of whom were her own friends, would be guillotined in a few days. She no longer hesitated, but plunged her dagger into the monster's heart, who expired with a single groan. She was at once arrested and brought before the revolutionary tribunal, where she boldly avowed and justified her act. She was of course condemned to the guillotine, and the sentence was carried into effect on the 17th July, 1793. Her beauty added greatly to the interest which her sanguinary heroism inspired.

CORDELIERS ("cord-wearers") was the name applied, in France, to the strictest branch of the Franciscan friars, on account of their wearing a girdle of knotted cord. At one period, this order had no less than 284 male and 128 female convents. During the revolution, the name was applied to the members of a political club which assembled in the chapel of a Franciscan monastery, and exercised (chiefly in Paris, however) great influence on the progress of the revolution. It was instituted in 1790. Its leaders were men of various opinions, including Danton, Hébert, Camille Desmoulins, and Marat. The C. were generally opposed to the Jacobins (q.v.); but it may be asserted that in these two clubs all the great popular movements of the revolution had their origin. In the session of the C., May 22, 1793, the insurrection which marked the close of the reign of terror was plotted. While the club was at the height of its influence, Camille Desmoulins commenced to issue his popular journal, *Le Vieux Cordelier*. Soon after the fall of Danton, the C. club lost its influence, and was an insignificant affair when it was closed by the convention.

CORDERIUS, or CORDIER, MATHURIN, 1478–1564; a native of Normandy; author of the *Colloquia*. He was especially fond of teaching children, and taught at Paris, where John Calvin was one of his scholars. He subsequently taught at Geneva. He wrote a number of books for children, one of them (the *Colloquia*) passing through almost innumerable editions, being used in schools for three centuries after his time.

CORD-GRASS, *Spartina*, a genus of grasses having compound spikes, the spikelets, arranged on one side; and having only one perfect floret, and very unequal glumes. One species, *S. stricta*, found in muddy salt-marshes on the e. and s.e. coasts of England, although remarkable for its extreme stiffness and rigidity of habit, is used for making ropes, on account of the toughness of its fiber.

CORDIA'CEÆ, a natural order of exogenous plants, closely allied to *boragineæ*, from which it differs chiefly in its drupaceous 4 to 8-celled fruit. It consists of trees with rough leaves, chiefly natives of the tropics, although some are found in cool parts of South America. The fruits called sebesten (q.v.), or sebesten plum, belong to this order, and to the genus *cordia;* which also contains some valuable timber-trees, particularly the Spanish elm, prince wood, or *bois de chypre* of the West Indies (*C. gerasacanthus*). It is a dark-brown wood, faintly striped, tough, elastic, and fine grained.

CORDIL'LERAS OF CENTRAL AMERICA. The word *cordillera* literally signifies a chain, and is applied in Spanish America to a chain of mountains. The C. of South Ameria are described under Andes. Those of Central America extend from the commencement of the isthmus of Darien to the n. of Mexico and California, and spread themselves, to speak generally, from sea to sea, presenting many diversities, and occupying the states of New Granada, Costa Rica, Nicaragua, Honduras, San Salvador, Guatemala, the Mexican Confederation, and New Mexico. They gradually increase in elevation from the isthmus of Panama, where at one point they are only 260 ft. high, until, in Mexico, they reach a height of more than 17,000 ft., and form magnificent plateaus.

CORDILLE'RAS OF CENTRAL AMERICA (*ante*). This section of the great mountain chain which stretches, almost without a break, from the Arctic ocean to the extreme s. point of South America, is confined to the isthmus of Panama and the small states of Central America. In Mexico, the United States, and British America, the main chain is called the Rocky mountains, and the long unbroken line skirting the Pacific coast of South America is known as the Andes. The Cordilleras present their lowest

elevation in the Panama isthmus, where the summit level (of the Panama railroad) is less than 300 ft.; and there, too, the breadth of the range is least, varying from about 30 to 70 miles. At another point, there is said to be a pass which is only 150 ft. above tide. In recent years all this region has been explored with a view to the construction of a ship canal from the Atlantic to the Pacific, and recently (Mar., 1880) the project has received new impetus from the presence in America of M. de Lesseps, the father of the Suez canal. The great obstacles to isthmus exploration are the extreme unhealthfulness of the climate, the continuous fall of rain, and the impenetrability of the tropical vegetation. Towards the Pacific, the slope of the mountains is abrupt and steep; towards the Atlantic it is more gradual. On what is known as the Nicaragua route, in the state of that name, the San Juan river finds its way through the e. branch of the mountains to Nicaragua lake, and that lake reaches within 12 m. of the Pacific; but on that narrow strip there runs a belt of the Cordilleras quite too formidable for canal engineering. Extinct and active volcanoes are common in these mountains, more especially in the e. range. Between these e. and w. ranges is a central basin about 300 by 150 m., comprising nearly the whole of the state of Nicaragua, and embracing much grand and beautiful scenery. From the waters, and near the shores of lake Nicaragua, rise enormous volcanoes, their sides rent with fissures and black with lava. Smoke and flame come from some of these volcanoes, but lava is seldom seen. The Cordilleras exhibit about the same scenery in the states of Honduras, San Salvador, and Guatemala. There are five volcanoes in San Salvador, and six in Guatemala; one of the latter, 14,000 ft. high, throws up water only. Silver and copper ores are found, and there is great abundance of red cedar, rosewood, mahogany, india rubber, boxwood, vanilla, cochineal, etc. The temperature in the interior is seldom excessive. Going towards Mexico, the height of the ranges decreases, and at the isthmus of Tehuantepec the highest pass between the oceans is in one place only 700 feet. Further north, the mountains spread out and form the great tableland of Mexico, with here and there isolated summits, some of which are actively volcanic, and many of which rise to very great heights.

COR'DON, in military operations, is a line of sentries inclosing or guarding any particular space of ground, to prevent the passage of persons other than those belonging to the army. The sentries are placed within sight of each other. If intended to guard against contagious diseases, it is called a *C. sanitaire.*

CORDON BLEU; knights of the ancient order (in France) of the Saint Esprit, or Holy Ghost, were so called because the jewel of the order was suspended on a blue ribbon. In late times, the term was degraded to mean a first-rate cook. The "cordon grand" is any member of the legion of honor, their decorations being suspended by a broad (or grand) ribbon.

COR'DOVA, a province in s. Spain on both sides of the Guadalquivir, intersected by railroads that connect with the ports of Cadiz and Malaga, and the railroad system northward; 4,159 sq.m.; pop. '70, 382,052. The land is fairly productive, and wine, oil, hemp, flax, honey, etc., are the products. Excellent horses and mules are raised, and there are mines of silver, copper, iron, lead, and coal. The chief town is the ancient city of Cordova.

CORDOVA, the capital of a state of the same name in the Argentine Confederation (q.v.), is situated on the Rio Primero, a tributary of the Parana, in lat. 31° 26′ s., and long. 63° 55′ west. It was founded by the conquerors of Tucuman in 1573. It has a cathedral and several churches, with a pop. of 28,523. The state of which C. is capital is situated near the center of the confederation, and contains about 57,275 sq.m., with a pop., in 1869, of 210,508, who occupy chiefly its western section. Cattle, sheep, and goats are numerous; and the soil is much fitter for maize and fruits than for wheat. The surface is mostly mountainous; and the ranges, which here and there are 2,500 ft. above the sea, are interspersed with barren flats of stone and sand.

COR'DOVA, or COR'DOBA, a city of Spain, capital of the province of Cordova, is situated in the midst of olives and palm-trees on the Guadalquivir, here crossed by a stone bridge of 16 arches, constructed by the Moors. Lat. 37° 53′ n., long. 4° 49′ west. Its old Moorish walls and convent-crowned hill in the background give it quite an oriental aspect; but its beauty, like most oriental beauty, is merely external; inside, its streets are narrow, dark, and dirty, with a general appearance of decay. Many gardens are inclosed within the walls. Among the principal buildings is the cathedral, formerly a Mohammedan mosque, an immense structure dating from the 8th c., and generally regarded as the finest type of a Moslem temple in Europe. Internally, its columns, composed of various-colored marble, jasper, and porphyry, form a perfect grove, there being still some 850 remaining, though at one time there were about half as many more. The bishop's palace, an old residence of the Moorish kings now used as stables, and several of the churches and convents, are also noteworthy. C. was at one time celebrated for its manufacture of Cordovan (q.v.), but that has now greatly declined. Its silversmiths and filigree workers have still a good reputation; and there are manufactures of paper, silken fabrics, hats, etc. Its inhabitants are proud, above even the pride of Spaniards. Pop. 42,900. C. is a very ancient place, having been founded by the Romans as Corduba, 152 B.C. Cæsar, 45 B.C., put 22,000 of its inhabitants to death for

having sided with Pompey. Taken by the Goths in the 6th c., it soon after fell into the hands of the Moors, and became the capital of the Moorish empire in Spain. From the 9th c. to the 12th c., it was one of the greatest centers of commerce in the world, and is said to have contained a million inhabitants. It was taken by Ferdinand III. of Castile in 1236, and never afterwards regained its prosperity. In modern times, C. was taken and plundered by the French under Dupont in 1808. C. is the birthplace of the two Senecas, the poet Lucan, and the astronomer Averroes. The province of Cordova has an area of 5,159 sq.m., and a pop. (1870) of 382,652. See ANDALUSIA.

COR'DOVA, FERNANDO FERNANDEZ DE, b. 1792; a Spanish commander who began military service in 1810, serving in the wars against Napoleon. In 1841, he was implicated with Concha in the conspiracy against Espartero; in 1847, he was minister of war, and afterwards inspector-gen. of infantry. In 1850, he was capt.gen. of Cuba. In 1853, he was made gen.-in-chief of cavalry. He attempted to support Isabella in the outbreak of 1854, but when the revolution became successful he fled to France. He returned a few years later, and in 1864, Narvaez made him minister of war. In 1868, in common with most of the Spanish grandees, he took part in the Prim revolution against Isabella. In 1870, he was again appointed capt.gen. of Cuba, and in 1871 he was made minister of state *ad interim* at Madrid.

COR'DOVAN, a species of leather prepared from goat-skins. It was originally, and at one time exclusively, manufactured by the Moors of Cordova, and hence its name. The best C. still comes from the Levant. It is used in book-binding, and in the finer kinds of boot and shoe making.

CORDYLINE. See TI.

CORE'A, a peninsular kingdom of eastern Asia, tributary to China; lat. 34° 40′ to 42° 30′ n., and long. 125° to 129° e., with an area estimated at 79,414 sq. miles. It is bounded e. by the sea of Japan; s. by the Yellow sea; w. by the Yellow sea and gulf of Pechili; and n. by the rivers Ya-lu and Tu-mên, which separate C. from Chinese and Russian Mantchuria respectively. These rivers take their rise from the eastern and western slopes of the vast desert mountain-tract of Ch'ang Peh Shan. Other considerable rivers are the P'ing Jang, discharging into the Yellow sea in lat. 39°; and the Han, also flowing w., near the mouth of which is the capital, Séoul or Saul (Chinese, Wang King). All accounts represent the country as mountainous throughout, densely wooded in some districts, with valleys moderately fertile. The climate, which in the n. is glacial, is elsewhere like that of Japan. There is ice and snow everywhere in winter. The rainfall of C. is excessive.

There is good reason to connect the people with the Tungusic stock that has peopled the whole of northern Asia. The features of the Coreans are more pronouncedly Mongolian than those of the Japanese, whom they most resemble. The language, differing widely from both Chinese and Japanese, resembles the latter in its polysyllabic form and alphabet of 27 letters, and has affinity with the existing Mongolian tongue. The native alphabet and writing is almost disused; the Chinese character is everywhere known. The religion of C., like its other official institutions, is based on that of China; the Chinese state gods are everywhere worshiped; Buddhism and Taoism have their votaries; and the literati profess the Confucian ethics. The monarchy is a despotism limited by the existence of privileged ranks and hereditary nobles. The officials are selected. The life of the Coreans is very primitive; the chief articles of food are inferior kinds of rice and grain. Agriculture is very backward. A little tobacco, cotton, and silk is produced. The principal fabrics are of coarse hemp. The only products bartered with the Chinese are paper and ginseng. Mineral treasures abound; small quantities of gold, silver, iron, copper, and lead are mined; and the Coreans are skillful in working metals. The pop. is variously estimated at from 5,000,000 to 20,000,000.

C. has steadfastly maintained a policy of strict isolation towards all outsiders, even towards the Chinese, with whom there is no intercourse save on occasion of the annual embassy, which is accompanied by a few privileged traders, and of the periodical fairs at the "gate-town," near the city of Fêng-hwang, in Mantchuria. The Chinese dislike to everything foreign is strengthened in the case of C. by traditions of ancient enmity between China and Ch'ao-sien, as C. was called in the 2d century B.C. The Mongol conquerors of China reduced C. also; but the Ming dynasty restored the Corean sovereign with the title of Kaoli-Wang (from which word Kaoli, through the Japanese form Ku-rai, comes the name Corea). Strange to say, the seeds of Christianity were sown in C. in 1592 by the invading army, composed chiefly of Christian converts, of the Japanese usurper, Taicosama. Hamel, a Dutch sailor, was wrecked here, and detained for 13 years; from his narrative it was that, till very recently, most of our scanty knowledge of C. was obtained. In 1784, Jesuit missionaries found their way into C., and had great success amongst the people. From 1835 till 1866, several intrepid and devoted French missionaries contrived to find shelter; and, in spite of incessant persecutions, the Christian community continued rather to increase, rising again, in 1852, to 11,000 souls. The massacre of nine missionaries, in 1866, led to an invasion of C. by a small French force, but without success. Nor have two successive American expeditions, provoked by an attack on an American vessel, succeeded in contributing at all to break down the barriers that have so long separated the Coreans from the rest of the world.

See *Journeys in North China*, by Rev. A. Williamson (1870); *Histoire de l'Eglise de Corée*, par Ch. Dallet, Missionaire Apostolique (Paris, 1874).

COREA (*ante*), native name CHO-SEN (Morning Calm). The name Corea comes from that of the ancient province Koria or Kokorai. The French call it Corée. It was first colonized by Kishi (Chinese, Ki Tsze), a Chinese courtier and reputed author of part of the Shu-King, the classic edited later by Confucius. Kishi introduced the elements of the civilization of ancient China into the peninsula, which he named Cho-sen. The early history of Corea is known through the Chinese and Japanese annals, the latter being very full, while many works on Corea exist in Japan. The ancient boundaries of Corea far exceeded their present limits. From a little before the Christian era, until the 10th c., the peninsula was divided into the three kingdoms of Shinra (or Shiraki), Korai (or Koma), and Hiaksai (or Kudara); or in Chinese, Sinlo, Kaoli, and Petsi. Though civil war was almost constant between the three states, with occasional wars with or invasions from China, and much help or conquest from Japan, yet in spite of war, the arts flourished, and it was through Corea, and not from China directly, that Japan received those elements of her civilization which are of Chinese origin. Corea sent to Japan many scholars, artists, and men of skill in every trade and profession, and the basis of nearly every order of arts or handicrafts in Japan is Corean. The most noted ancient invasion of the Japanese is that of the empress, Jingu Kogu, in the 3d century. Fusan (q.v.), on the e. coast, has been held by the Japanese from very ancient times. In the 10th c., Shinra obtained supremacy in the penisula, and united Corea was then named Kori (Jap. Korai). In 1231 A.D., the Mongols invaded Corea, and in 1256, reduced it to vassalage, after a bloody resistance, the Corean king going in person to the court of the conqueror of continents to do homage. Anxious to humble Japan, Khublai Khan made Corea his base of operations for his expedition in 1273 which failed, and in 1281 for his mighty armada of 3,500 war junks, and 180,000 Tartars, Coreans, and Chinese. Of his vast fleet and host, few escaped the storm and the arrows of the Japanese. The Korai dynasty came to an end in the 14th c., the Corean king refusing or neglecting to pay tribute to the Ming emperors of China. A Chinese army was sent against Corea, and the Corea gen. Seikei dethroned the king, and, being made sovereign by the army, made offers of homage to the Chinese emperor, and received investiture as Cho-sen-o (king of Cho-sen), the ancient name of the country having been restored. This was in 1392. The dynasty thus established, rules Corea to-day. In 1597, Hideyoshi (Taiko Sama) having unified all Japan, resolved on the invasion of China through Corea, and sent word to the latter to resume in full form her ancient relation as tributary vassal. Corea having insultingly refused, Hideyoshi dispatched an army of 160,000 Japanese veterans, under command of his generals Konishi and Kato, to invade Corea. So well organized and equipped was the advance detachment, that within three weeks after their landing at Fusan, they had reduced the castles along the line of march and were in the Seoul, or capital (see SEOUL). Pushing northward to Ping Yang, this city was occupied, and the army of Konishi was reinforced by the other corps which had overrun the seven other provinces of the peninsula. A Chinese army of 40,000 men now entered Corea, the first battle between the allies and invaders being fought at Ping Yang (q.v.). Falling back on Seoul, the Japanese fortified it, but massing their forces, left their intrenchments and gave battle to the allies. In the hard-fought battle which ensued, ten thousand men were said to have fallen. Diplomacy at Pekin and Kioto, and in Corea, checked hostilities for a time; but the war was renewed with fresh vigor. Several severe naval battles on a large scale were fought; on land the castle of Nangan, one of the strongest fortresses in the kingdom, was taken by the Japanese, the Chinese commander slain, and 3,726 heads of Chinamen and Coreans were cut off and made into a trophy. The final pivot of the war was at Urusan castle, a few miles n. of Fusan. During the siege, which lasted one year, the large Japanese garrison was reduced by the straits of hunger to eat human flesh. Being relieved, a great pitched battle fought near the castle resulted in bloody defeat of the Chinese and Coreans. The death of Hideyoshi occurring soon after, the Japanese armies were withdrawn, and peace was made on the basis of Corea's tributary vassalage to Japan. In 1636, the Manchu Tartars invaded Corea, the king receiving investiture from the Manchu, who soon afterwards entered China, and established the present dynasty on the throne of China. Under every form of national government, and of foreign conquest, Corea has remained tributary to China, and until 1876 to Japan, her geographical position unfortunately rendering her vulnerable to every invasion from e. or w., and making her like grist between two great rival nations as millstones. No seeds of Christianity were left by the Japanese army, though Konishi's division was largely composed of converts of the Jesuit missionaries in Japan; nor by the crew of the Dutch ship *Sparwehr* shipwrecked off Quelpaert island in 1653, and detained as prisoners in Corea until 1667, when they escaped, Hamel, the supercargo, writing an account of their adventures. Christianity began in 1777. Piek-i, a young Corean scholar in a coterie of learned men, having found some books on Christian doctrines, composed in Chinese by the Jesuits at Pekin, brought into Corea by a member of the embassy, began the practice of the Christian life, and the propagation of the new ideas. The native Christians increasing, ignorantly formed a hierarchy among themselves, but abandoned it as greater knowledge showed

them their error. In 1794, the first Chinese priest, and in 1836, the first European missionary, M. Maubant, had penetrated Corea. Persecution marked the history of the church from the very first, but with intervals of quiet. Down to 1866, after twenty years of uninterrupted labor, and eighty years of Corean Christianity, four bishops and nineteen priests, all except four being Frenchmen, had entered Corea. Of these, fourteen suffered death at the hands of the government, and four died of toil or disease. Nine having been put to death at once, in 1866, the French admiral, Roze, with seven ships and 1000 men, captured Kang Hoa city (q.v.), but suffered repulse while attacking a fortified monastery, and the badly-planned expedition failed. In Aug., 1866, the American schooner *General Sherman*, with a cargo of cotton goods, glass, tin plate, etc., and heavily armed, left Chifu, China, on a trading or semi-piratical expedition to Corea. She had on board 19 Malay and Chinese sailors, and five foreigners, viz.: Mr. Wm. B. Preston, owner, and the captain and mate, Americans; Mr. Hogarth, supercargo, and the Rev. Mr. Thomas, Englishman. The latter, though warned of the character of the cruise, went on board as interpreter and to improve his knowledge of the Corean language. Arriving in Ping Yang river, they made their way up to the city. What further befell them is not fully known, but the Coreans most probably mistaking the foreigners for their late enemies, Frenchmen, and being provoked into a quarrel, attacked and killed them all. To obtain redress, the U. S. S. *Wachuset*, com. R. W. Shufeldt, and the U. S. S. *Shenandoah*, com. J. C. Febiger, were dispatched in 1867 to the w. coast of Corea, but no satisfaction being obtained, the United States government determined on sending an expedition to the Corean capital. The American fleet under commodore John Rodgers sailed from Nagasaki, Japan, May 16, 1870, reaching the French anchorage off Kang Hoa on the 23d. The fleet consisted of the *Colorado, Alaska, Benecia, Monocacy*, and *Palos*, the force numbering about 1000 men, and having on board F. F. Low, U. S. minister to China, who was, if possible, to make a treaty with Corea. Negotiations were soon opened; but with unseemly haste, and without right or warrant, four armed steam launches acting as "surveying boats" were sent up the Hang river, together with the *Monocacy* and *Palos*. The Coreans, resenting this armed invasion of their territory, fired on the Americans, who returned the fire with their heavy guns. June 10, a further expedition of 2 gunboats, the 4 steam-launches, and 759 men, were sent up the river to capture all the forts. Within 48 hours, the landing force and the gunboats co-operating, five forts were captured and dismantled, 50 flags and 481 pieces of artillery were taken, and probably 400 Coreans slain; the American loss being less than 15 wounded and 3 killed, among the latter the gallant lieut. McKee. The Corean government refusing to open negotiations, the American commodore discharged his prisoners and returned to Shanghai, China. Though England, Russia, France, Germany, and the United States had failed to open Corea, the Japanese, after far greater preparations and equipments, resolved to succeed or go to war. The immediate cause of their action, was the firing by a Corean fort upon one of their gun-boats, the *Unyo Kan*, Sept. 19, 1875. The Japanese having landed for water, and being in uniform similar to that of American sailors, were probably mistaken by the Coreans for the latter, the place being the scene of the fight with the Americans in 1871. The mikado sent Arinori Mori (see MORI, A.) to Pekin to obtain from China a declaration of neutrality. Receiving from the Chinese a written disclaimer of all authority over Corea, the Japanese government dispatched a fleet and force to Corea, under gen. Kuroda, intrusting the diplomatic action to Inouye (q.v.). Imitating, even to minutest details, the policy and example of the American commodore Perry in dealing with Japan in 1854, Kuroda and Inouye gained a like "brain-victory," and a treaty of amity and commerce was signed Feb. 27, 1876. Under the provisions of this treaty, a Corean embassy visited Tokio in 1877, and the port of Gensan (q.v.) with Fusan was opened to Japanese residence and trade. In addition to the few Coreans residing in Japan and China, 5,000 live in Russian Manchuria, chiefly in settlements along the Tumen river, where they are instructed by Russian teachers and missionaries. It is now proved by linguists that the Corean and Japanese languages have a very close affinity, the Corean being probably the parent stock. See *A Comparative Study of the Japanese and Korean Languages*, by W. G. Aston, in journal of the royal Asiatic society of Great Britain, Aug., 1879. Education in Corea is based on the Chinese classics. For the best map of Corea see in Dallet, and that published by the Japanese war department, size 5 ft. by 4. See Klaproth, *San Kokf Tsou Ran To Sets;* Basil Hall's *A Voyage to the West Coast of Corea; The Corean Martyrs;* Grinnel's journey, American Geographical Society's journal, 1870–71; Dallet's *Histoire de L'Elise de Corée, Corean Primer*, and W. E. Griffis's *Corea*, soon to be issued.

COREG'ONUS, a genus of fishes of the family *salmonidæ*, having the first dorsal fin further forward than the ventrals, and higher than it is long, the scales large, the teeth either minute or wanting. The species are numerous, and some of them inhabit the sea, others fresh-water. To this genus belong the gwyniad of the lakes of Wales and Cumberland, the powan of Loch Lomond, the pollan of the lakes of Ireland, etc. From their herring-like appearance, the gwyniad and powan are often called *fresh-water herring*. Some of the species found in the lakes and rivers of North America are also known as *herring salmon;* but a more valuable species, regarded as one of the finest of all fish, is the WHITE FISH (*C. sàpidus* or *albus*) of North America. Other species are found in the rivers and lakes of Europe, even to the North cape, in those of Siberia, etc.

COREL'LI, ARCANGELO, surnamed *Il Divino*, an Italian musical composer, was b. at Fusignano in the Bolognese, in 1653. He studied counterpoint with Matteo Simonelli, and the violin with Bassini. In 1672, he visited Paris, and in 1680, Germany, where he was well received. In the following year he returned to Italy, and fixed his abode at Rome, where, in 1683, he published his *Twelve Sonatas for Two Violins and a Bass.* In 1685, appeared another set, bearing the title of *Balletti da Camera.* A third and fourth set were published at Bologna in 1690 and 1694. In 1700, appeared his sonatas for violin and bass, or harpsichord. This work is one of C.'s masterpieces, and has placed him in the first rank of instrumental composers. C.'s greatest effort was his *Concerti Grossi*, which appeared only six weeks before his death. The style of C. is one of the very best, and his works continue to the present day models of classical study in instrumental music.

CORENTYN', a river of Guiana in South America, rises in lat. 1° n., having its headwaters 25 m. to the e. of those of the Essequibo. With a generally northerly course, it separates the Dutch and British portions of the country; and at its mouth, in lat. 6° n. and long. 57° w., it forms an estuary of 25 m. in width. It is navigable for boats about 150 m. upwards, measured by its windings; and at a point still higher, where further exploration was impeded by a series of cataracts, it was found to be 900 yards across. The C. is one of the streams by which Guiana possesses comparatively easy means of communication with the basin of the Amazon on the one side, and that of the Orinoco on the other.

COREOP'SIS, a herbaceous plant of the order compositæ, popularly known as tickseed, the fruit being in the shape of a small bug. It is sometimes raised in gardens for the sake of its flowers, which are yellow with a purple center.

CORFE CASTLE, a village in the middle of Purbeck isle or peninsula, in the s. of Dorsetshire, 24 m. e.s.e. of Dorchester. In the vicinity are stone and marble quarries, and clay-works for the potteries. Pop. of parish (1871), 1806. A castle, giving its name to the village, stands on a neighboring hill. It seems to have been founded in the 10th c., and was long one of the strongest fortresses in the kingdom. Here king Edward the martyr was murdered by his step-mother, Elfrida, about 980, and king John, during his disputes with his barons, kept his regalia here for safety. Here also, in 1642, lady Bankes defended the castle for six weeks against Charles I. It was dismantled by Fairfax in 1645.

COR'FU, the most northerly of the Ionian islands (q.v.), in lat. 38° 40′ to 39° 40′ n., long. 19° 10′ to 20° east. It has a length of about 38 m., with a breadth varying from 3 or 4 to 20 miles. Area, 227 sq. miles. Pop. '71, 72,466. Like the rest of the Ionian islands, it is mountainous, and the mountains are generally naked and dry, the highest summit, Pandokrátora, being between 3,000 and 4,000 ft. above the sea. The valleys, however, are very fertile, and yield olive-oil, wine, honey, oranges, figs, etc. Salt is also produced in some quantity. The climate is generally mild and healthy. The principal town, Corfu, underwent great improvements during the British protectorate, and is copiously supplied with water. It is situated on an elevation, has some good streets and a fine esplanade. The town, with about 25,000 inhabitants and a considerable trade, is the seat of an archbishop of the Greek church, and of a Latin bishop. The principal institutions are the penitentiary, the lunatic asylum, the infirmary, foundling hospital, etc. The university, founded by lord Guildford in 1823, now represented by a lyceum, was suppressed when (in 1864) the Ionian islands were incorporated with the kingdom of Greece. At the incorporation it was stipulated that Corfu and Paxo were to enjoy perpetual neutrality. The language spoken is considered the softest of the modern Greek dialects.—The ancient name of the island of C. was *Corcyra.* It is said to have been occupied first by the Phæacians, and then by the Liburnians; but the accounts of it are somewhat mythical until its settlement by the Corinthians about 734 B.C., and through its commerce it soon after acquired a considerable importance. It soon quarreled with the mother-country, and after many vicissitudes of fortune, passed under the dominion of the Romans about 229 B.C.

CORIAN'DER, *Coriandrum sativum*, an annual plant of the natural order *umbelliferæ*, with branching stem, 1 to 2 ft. high, the lower leaves bipinnate, the upper leaves more compound, and globose fruit. It is a native of the s. of Europe and of the east, and has long been cultivated for the sake of its fruit; and has thus become naturalized in some parts of England, although its fruit (*C. seed*) is much less used in Britain than in Germany, and some other European countries. The whole plant, when fresh, has a very offensive smell, but the ripe and perfectly dry fruit has an agreeable aromatic smell and a sweetish aromatic taste. It is used in medicine as a carminative, and as a corrective of certain purgatives; also in domestic economy as an aromatic, being very often mixed with bread in the n. of Europe; spirituous liquors are flavored with it; and confectioners cover it with sugar, to make a well-known kind of comfit. In the s. of England, it is common to sow C. and caraway together, the C. yielding a crop in the first year, and the caraway in years following. C. delights in a rich soil, and is much cultivated and used in India.

CORIGLIA'NO, a t. of Italy, in the province of Cosenza, about 4 m. from the gulf of Taranto, beautifully situated on a hill, round which it is built in the form of an amphitheater, a fine old castle crowning the summit. The base of the eminence is clad with lemon and orange groves, amid which rise some elegant villas; the whole rendering C. one of the most agreeable places in the Calabrias. It has extensive licorice manufactories, and a trade in wine and fruits. Pop. 10,600.

CORIN'GA, a maritime t. in the collectorate of Godavery and province of Madras, stands on the s. side of the estuary of a river of its own name, one of the branches of the Godavery. Its harbor is breasted by a bar, which at spring-tide shows a depth of 12 or 14 feet. Besides having a considerable general trade, it is the best place on the coast for the building and repairing of small vessels. It has been twice destroyed by inundations of the sea. In May, 1787, during the n.e. monsoon, the tide overwhelmed the city and the adjacent country, drowning about 15,000 people; and again in 1832, a similar deluge occurred, leaving behind it, besides the more ordinary traces of its power, several ships lying high and dry in fields in the neighborhood. Pop. '71, 5,649.

CORIN'NA, a Greek lyric poetess, famous alike for her beauty and genius, was b. at Tanagra, in Bœotia. The date of her birth is not known, but she flourished about 500 B.C. She lived principally at Thebes, and hence is sometimes called a Theban. Ælian states that on five different occasions she vanquished her contemporary, Pindar, in a poetic contest, but Pausanius alludes to only *one* victory of hers. Her townsmen showed their appreciation of her genius by placing a statue of her in their gymnasium. She was surnamed *Muia* ("the Fly"), probably on account of the tenderness and softness of her poems. Of her numerous poems, which were composed in the Æolic dialect, only a few fragments remain, which have been published by Schneidewin, in his *Delectus Poetarum Græcorum* (Gött. 1839), and by Bergk, in his *Lyrici Poetæ Græci* (Leip. 1843.)

COR'INTH, a village in Alcorn co., Miss., near the Tennessee border; pop. '70, 1512—679 colored. During the war of the rebellion, this was a place of much importance and was early occupied by the confederates. After the battle of Shiloh, Beauregard retreated to Corinth, followed by the unionists under Halleck. After some time spent in what went by the name of "the siege of Corinth," the confederates retreated and Corinth was occupied by the union forces Oct. 3, 1863, the confederates undertook to recapture the place; but on the 4th they were signally defeated in an attempt to carry it by assault, were routed, and fled in disorder. The union loss was 315 killed, 1812 wounded, and 232 prisoners; that of the confederates, 1423 found dead on the field, probably 5,000 wounded, and 2,248 prisoners.

COR'INTH (originally called *Ephyre*), a famous city of antiquity situated on the isthmus connecting the northern division of Greece, or Hellas proper, with the Peloponnesus. Its citadel was the Acrocorinthus, an isolated hill 1886 ft. high, separated from the Oneian range on the n. of the isthmus by a ravine, and forming, in the opinion of col. Mure, the most gigantic natural citadel in Europe, neither the Acropolis of Athens nor the fortress of Gibraltar being able even remotely to compete with it. At the northern foot of this hill lay the city of C., on a broad level rock nearly 200 ft. above the level of the isthmus. It was probably founded by the Phenicians, who had various settlements on the Grecian coast, and who could hardly have failed to notice the extraordinary maritime advantages of its situation. According to its legendary history, however, it was founded by Sisyphus, the Æolian, about 1350 B.C. It was then conquered by the Heracleidæ, who ruled as an oligarchy for twelve generations, when they were expelled by Cypselus, the father of Periander, with the help of the populace, 657 B.C. After a period of 77 years, the Spartans—the great enemies of democracy in Greece—established again a sort of aristocratic government, and C. now figures in history as the close ally of Sparta. In the Peloponnesian war, it at first furnished the greater part of the fleet employed against the Athenians, but afterwards became jealous of the Lacedemonian power, and was induced to league with other Grecian states against it, 395 B.C. The war which ensued is known as the *Corinthian war*, and lasted till the peace of Antalcidas, 387 B.C. In the strife which broke out between Thebes and Sparta, C. remained faithful to the latter. After the battle of Chæroneia, 338 B.C., in which the liberties of Greece were crushed by the Macedonians, it was garrisoned and held by the latter. Subsequently, it was the center of the Achean league formed against the Romans, and in revenge was utterly destroyed (146 B.C.) by L. Mummius, the Roman general. For a whole century it continued in ruins. In 46 B.C., Julius Cæsar rebuilt it, and made it the capital of Achaia; and although it never again attained its former importance, it became both prosperous and powerful. St. Paul planted a Christian church here, to which he also addressed two epistles. Pausanias, who visited it in the 2d c. A.D., states that it then contained many public buildings. From the western emperors it passed into the hands of the Venetians. In 1458 A.D. it was conquered by the Turks under Mohammed II., recovered by the Venetians in 1687, and retaken by the Turks in 1715, who held it till 1823. Reduced to ashes in the revolutionary war, and again utterly destroyed by an earthquake in 1858, C. is being now rebuilt in a more convenient position near the shore of the gulf of Corinth. Its pop. is about 2,000.

Ancient C. was surrounded by walls which included the Acrocorinthus, and had two harbors—*Lechæum*, on the Crisæan bay (now the gulf of Lepanto), opening into the Adriatic; and Cenchreæ, on the Saronic gulf (now the gulf of Athens), opening into the Ægean. The former was connected with the city by two parallel walls. The vast wealth of its merchants was the bane of Corinth. It became notorious as the most licentious city in all Greece, and was the favorite resort of courtezans. The patron goddess of the city was Aphrodite, in whose temple, on the Acrocorinthus, were kept more than a thousand "sacred female slaves" (*hierodouloi*) for the use of strangers. C., however, has better claims to remembrance. The art of painting is said to have been invented here, and at the time of its capture by the Romans, it possessed some of the finest pictures in Greece. Among these was the picture of Bacchus, by Aristides, for which Attalus offered 600,000 sesterces. Architecture, statuary, and bronze-work also flourished, and earlier, during the reign of Periander, poetry was cultivated, Arion having either invented or improved the dithyramb in Corinth. Afterwards, however, no attention was paid to literature by the inhabitants, and it has been noticed that "among the illustrious writers of Greece not a single Corinthian appears."

CORINTH, GULF OF, or GULF OF LEPANTO. An arm of the Mediterranean extending from w. to e. through the center of Greece, from the Ionian to within about 5 m. of the Ægean sea, thus almost dividing the kingdom into two parts, the Morea forming the southern portion. Its greatest length is about 75 m., with an average breadth of 15 miles. The outline of the coast is exceedingly varied, and the scenery is everywhere as attractive as it is rich in contrast. The narrow neck of land, separating the gulfs of C. and Egina, and uniting the Morea to Attica, is called the ISTHMUS of Corinth. It is variously estimated, according as it is measured from different points, at from 10 to 20 m. in length, and its breadth varies from 4 to 8 miles. The project of cutting through this isthmus, in order to unite the Ionian and Ægean seas, was one early entertained, and attempted to be carried out by Nero without success. To protect the Morea from land attack, however, a strong wall, flanked with towers, was built across the isthmus, and traces of it may still be seen, as well as of other remains of antiquity. The celebrated isthmian games were contested upon this tract.

CORINTHIAN ORDER. See COLUMN.

CORINTHIANS, EPISTLES TO THE, were written by St. Paul, 57 or 58 A.D. The first was composed at Ephesus; the second, according to general opinion, at Philippi, but this is doubtful. The genuineness of both is all but universally recognized. From the contents of 1 Cor., chap. 5, verse 9, it has been concluded by many theologians that Paul must have written a previous epistle, now lost.

CORINTHIANS, EPISTLES TO THE (*ante*). From a passage in what is now named the first epistle—"I wrote to you in the epistle"—many have inferred that an earlier letter had been sent by the apostle to the church of Corinth. The weight of evidence, however, is against that opinion. The genuineness of the first epistle has never been doubted, and it is attested by the earliest and most abundant proof. The most probable date assigned to it is A.D. 54. It was occasioned by the divisions, immoralities, and disorders which, the apostle had heard, were existing in the church; and by the request of the church for instruction and advice. The epistle, therefore, naturally consists of two parts: the first applying remedies, and the second answering questions.

In the first part, the apostle expresses pleasure and thankfulness, in view of the abundant spiritual gifts which the Corinthian Christians had received. (1.) He then proceeds to rebuke their divisions, and to give the reasons why they and all Christians should be united in Christ and among themselves. (2.) He condemns sharply the immorality which some of them practiced, and the indifference to it which many of them showed. Both the crime and the insensibility to its guilt had their origin in the corruption universal among the Gentiles, and so developed at Corinth that "to Corinthianize" was a synonym for licentiousness, and that all who had any remnant of prudence or of shame felt that Corinth was no place for them. Hence it followed that even true converts began their new life in an atmosphere of which we can have only the faintest idea, now that the Gospel has been waging war against corruption for 1800 years.

In the second part, the questions submitted by the church are answered. They had reference (1) to marriage and celibacy; (2) to the lawfulness of eating meats sacrificed to idols; (3) to the decorum of manner proper for both men and women in religious assemblies; (4) to the impropriety in their observance of the Lord's supper, which, like the immorality already spoken of, was the effect of their birth and training amidst the disgraceful practices of idolatrous festivity; (5) to unbelief in the resurrection of the dead; and (6) to the estimate in which spiritual gifts should be held. On all these points, principles are announced and arguments enforced which, while meeting the difficulties and errors then prevalent, have also a general application. At the close of the epistle, directions are given for contributions, and salutations are sent to the members of the church.

The genuineness of the second epistle has been as generally admitted as that of the first; and it is equally well attested by both external and internal proofs. It was written soon after the first, as a sequel to it, and probably from Philippi. Having been informed by Titus of the effects produced by his reproofs and instructions, Paul was

comforted and encouraged, yet saw that the reformation had been only partial. Many of the Corinthians had amended their lives; many were deeply penitent; a grievously offending member of the church had been expelled, and renewed respect for the apostle had been shown. Some, however, still under the influence of false teachers, denied the divine authority of the apostle's ministry, and endeavored to turn his letter against himself. They charged him with vacillation of purpose, with severity, with vainglory, and even urged against him personal infirmity as an offset to official power. The second epistle was written to meet these circumstances of the church. In it the apostle (1) answers the charge of vacillation, affirming that his delay in visiting them had been caused by the persecution to which he had been subjected, and by his desire to afford them longer time for perfecting the reformation which they had begun. (2) He assures them that, so far from having been tyrannical or severe in his discipline, he earnestly desired the welfare both of the church and of the particular offender, and that as the good effect of the sentence of excommunication had been manifested, he hoped that it would no longer be enforced. (3) He ascribes the great success of his ministry altogether to the power and grace of God. He acknowledges his own personal unworthiness and weakness, but appeals confidently to the abundant testimony which God had given to his work in preaching the gospel and establishing the church. Nowhere had this divine support been more triumphantly displayed than among the Corinthians themselves; and it would continue to be given, however contumacious any of them might be. (4) He renews his affectionate exhortations to a holy and beneficent life.

CORIOLAN'US, CAIUS or CNÆUS MARCIUS, a Roman patrician, surnamed, according to the half-fabulous legend, C., on account of his capture of the town of Corioli, belonging to the Volsci (493 B.C.). Of a proud and haughty spirit, he was strongly opposed to the plebeians, whom he looked upon as the "enemies" of his order; and on one occasion, during a time of famine, he argued in the senate against a gratuitous distribution of the corn which had arrived from Sicily, and insisted that the plebeian tribunes, lately instituted, should first be discharged from office. For this he was impeached and banished. He took refuge among the Volscians, whom he aided in their war with the Romans. His victories at the head of his Volscian troops alarmed the Romans, who, on his approach to their city, sent a variety of deputations to plead with him. He was deaf to every entreaty. At last, the noblest matrons of Rome, headed by his old mother and his wife, Volumnia, leading her two children, came to his tent. His burning desire to be revenged on those who had dishonored him was cooled by the tears of his relatives, and he led back the Volsci to their own territories, where he lived to an advanced age. Shakespeare has written a play on the subject, in which the character of C. is conceived in the grandest and most aristocratic style.

CORIP'PUS, FLAVIUS CRESCONIUS, a native of Africa, supposed to have lived in the 6th c.; author of a panegyric on Justin the younger, Byzantine emperor from 565 to 578 A.D. Corippus was also the author of *Johannis*, a poem celebrating the exploits of a proconsul of that name in Africa in Justinian's time.

CORK (Span. *corcho*, from Lat. *cortex*) is the unusually developed *epiphlœum* (see BARK) of the bark of the cork-tree or CORK-OAK (*quercus suber*), the *alcornoque* of the Spaniards, a species of oak (q.v.), a native of the s. of Europe and n. of Africa. Spain and Portugal chiefly supply the world with C., and in these countries the tree is often planted for the sake of the cork. The cork-tree is not of great size, generally 20 to 40 ft. high, much branched, with ovate-oblong evergreen leaves, which are sometimes entire and sometimes sharply serrated. The acorns are eatable, and resemble chestnuts in taste. The bark in trees or branches from three to five years old acquires a fungous appearance, new layers of cellular tissue being formed, and the outer parts cracking from distension, until they are finally thrown off in large flakes, when a new formation of the same kind takes place. C. intended for the market is generally stripped off a year or two before it would naturally come away, and the process is repeated at intervals of six or eight years. The bark of young trees and branches is either useless or of very inferior quality; it is only after the third peeling that good C. is produced. The removal of the C., being not the removal of the whole bark, but only of external layers of spongy cellular tissue, all or greater part of which has ceased to have any true vitality, and has become an incumbrance to the tree, is so far from being injurious, that, when done with proper care, it rather promotes the health of the tree, which continues to yield crops of C. for almost 150 years. In stripping off the C., longitudinal and transverse incisions are made to the proper depth, and each piece is then cut away from the tree by a curved knife with two handles. The pieces are soaked in water, pressed flat, dried, and superficially charred, to remove decayed parts and conceal blemishes, before they are packed in bales for the market. Besides the use of C. for stopping bottles, casks, etc., it is much used, on account of its lightness, for floats of nets, swimming-belts, etc.; and on account of its impermeability to water, and its being a slow conductor of heat, inner soles of shoes are made of it. All these uses are mentioned by Pliny; but the general employment of corks for glass bottles appears to date only from the 15th century. The *Spanish black* used by painters is made by burning C. in close vessels, and the parings of C. are carefully kept by cork cutters for this purpose. There are many other applications of this valuable substance in the arts, which cannot here be detailed.

The C. tree is occasionally planted in the s. of England, but the climate is not sufficiently warm.

The wood of some trees possesses the cellular sponginess, lightness, and elasticity of C. in such a degree as to be sometimes substituted for it in many of its uses, as that of the *anona palustris* (corkwood, or alligator apple) in the West Indies, etc.

CORK-CUTTING. The bark, after being cut into square pieces or sheets, is pressed, to remove its natural curvature and flatten it. If it is found that simple pressure has not flattened it sufficiently, it is heated on the convex side, and the contraction thus produced straightens it. It is then cut into slips, and these slips into squares, according to the required size of the corks. These are rounded by the cork-cutter by means of a broad sharp knife; the cork is held in the left hand, and rested against a block of wood, and the knife pushed forward, and at the same time its edge is made to describe a circular curve by a skillful turn of the wrist. The knife requires continual sharpening; the workman has a board before him on which the knife is rubbed on each side *after every cut.*

Many attempts have been made to cut corks by machinery. A patent cork-cutting company was established a few years since, but it failed. The chief difficulty in applying machines to this purpose arises from the necessity of continually sharpening the knife or cutters, for it is a curious fact, that so soft a substance as cork blunts the tools used in cutting it far more rapidly than do the hardest or toughest of metals. A cork-cutter's knife requires sharpening every second, while the tool that is used for planing, turning, or boring steel will work continously for hours without sharpening. In most of the machines, the corks, after being cut into squares of the required length, are made to revolve on grasping spindles; and cutters of various forms, such as revolving cutter-wheels, hollow cones with internal cutters, reciprocating blades, toothed cutters, etc., are brought to bear upon the revolving cork.

CORK, a maritime co. in Munster, the southmost and largest of the Irish counties. It is bounded on the n. by Limerick, e. by Tipperary and Waterford, s. by the Atlantic, w. by Kerry. Greatest length from e. to w., 110 m.; greatest breadth, 70; average, 34. Area, 1,849,683 acres, of which 430,541 were under tillage in 1876. C. is hilly, with great variety of surface. The w. part is rocky, mountainous, wild and boggy; the e. and s., rich, fertile, and picturesque. The ranges run e. and w., except the Boghra mountains, between the Lee and Blackwater. The coast is bold and rocky, and from its indentations, 250 m. long; the bays, which run 3 to 25 m. inland, admitting large vessels. The chief bays are Bantry, Dunmanus, Clonakilty, Kinsale, Cork harbor, and Youghal. There are many isles off the coast, the chief being Whiddy (in Bantry bay), Bear, Innissherkin, Great island, and Cape Clear, which lies in lat. 51° 25′ n. and long. 9° 30′ w., and, with the exception of a rock 4 m. to the s.s.w., is the southmost point in Ireland. In the w., C. is divided from Kerry by a range of Silurian clay-slate, running n.e. and n., the chief points being 1200 to 2,200 ft. high. This range sends offshoots to the e., which divide the county into the parallel basins of the three chief rivers of C., the Blackwater, Lee and Bandon; the lower parts of these basins are well cultivated and productive. The basins of the Lee and Bandon consist of red and yellow Devonian sandstone, with some beds of lower carboniferous limestone. This limestone, as in other parts of Ireland, forms the largest lowland tracts and valleys of the county. The Blackwater basin also consists of Devonian strata, but with more limestone. Part of the Munster coal-field occupies 400 sq. m. in the n.w. of the county, with a cold, stiff, moory soil over it. The river-beds generally mark the limestone tracts. C. has many small lakes in the west. One of these lies at the source of the Lee, amid wild, picturesque scenery, with the ruins of a chapel on an islet frequented by pilgrims. The chief mineral productions are coal and iron, copper (the mines of which are the richest in Ireland), limestone, fine dark-gray and also red marble rich in fossil shells, fullers' earth, brick-clay, marl. There is a thermal magnesian spring at Mallow. The climate is moist, but genial. The soils are calcareous, loamy, and moory. The dairies are extensive, and C. butter stands in high estimation. The cattle are small in size, but yield large quantities of milk. Of the land under crops in 1876, 18,043 acres were under wheat, 117,332 acres under oats, 21,950 acres under barley, bere, and rye, 71,958 acres under potatoes, 39,528 acres under turnips, 15,720 acres under other green crops, and 145,370 acres under meadow and clover. The live-stock in the same year consisted of 53,425 horses and mules, 9,312 asses, 365,729 cattle, 322,349 sheep, 170,048 pigs, 25,102 goats, and 1,135,937 head of poultry. The chief manufactures are linen, whisky, porter; and the chief exports provisions. Pop. '41, 854,118; '51, 653,180; '71, 517,076. C. co. returns eight members in all to parliament—two for the county, two for C. city, and one each for Bandon, Mallow, Kinsale, and Youghal. At the end of 1875 there were 100,705 pupils attending the national schools in C., of whom 95,769 were Roman Catholic, 4,194 Protestant Episcopal, and 329 Presbyterian. The antiquities of C. are stone circles and altars, two round towers, circular earthworks or raths; many ruins of abbeys and churches, chiefly built by descendants of the English invaders under Henry II., and many ancient castles or square towers of great historical interest.

CORK, a city and parl. borough of Ireland, capital of the county of the same name, and a county in itself, on the Lee, 11 m. above its discharge into the sea, stands in the

center of a picturesque valley. It is built in part on an island, formerly a swamp, which the word *Cork, Corcoch,* or *Corcagh* implies; in part, on the n. and s. slopes of the river-banks. The houses are generally of old red sandstone. Nine bridges cross the river to the central islands. There is a spacious public park, and a walk above a mile long, lined by noble elms, on the w. of the city. There is also a handsome public cemetery. C. has a pleasant picturesqueness from its uneven ground, irregular streets, intersecting river, and overhanging heights. The chief buildings are St. Anne Shandon's church, with a tower 170 ft. high; several Catholic churches; 4 monasteries; 2 nunneries; the bishop's palace; and queen's college, a fine Tudor-Gothic quadrangular building, opened in 1849. The banks of the Lee above and below C. are richly planted, and studded with villas. The Lee is navigable to about a mile above the city, and on the improvement of the navigation the harbor commissioners have expended above £300,000 within the last 25 years. The extent of the quays is now above 4 m., and ships of 600 tons reach them. C. harbor, noted for its size and safety, is a basin of 10 sq. m., formed by the estuary of the Lee. It could contain the whole British navy, and has been the main source of the rise and progress of the city. The estuary contains several large isles, rising abruptly and high above the water, with narrow channels between them. The entrance is by a channel 2 m. by 1, defended by batteries, on Spike, Hawlboline, and Rocky islands, which are occupied by convict and ordnance depots, artillery barracks, and a powder-magazine. On the shores of the estuary are the towns of Passage and Queenstown, formerly Cove of Cork. C. harbor is much frequented by wind-bound ships and ships waiting orders. In 1875, 2,539 vessels, with a total tonnage of 681,670 tons, entered the port; and 1537, of 443,057 tons, cleared. The harbor revenue in 1875 was £64,918. The chief manufactures are leather, iron, gloves, ginghams, friezes, flour, malt liquors, and whisky; iron ship-building has been largely carried on since 1872. The chief exports are grain, provisions, butter, live-stock, and linen, valued at several millions sterling yearly. Pop. '71, 78,642; parl. bor., 100,518; of whom about $\frac{5}{6}$ths are Roman Catholics. C. returns 2 members to parliament. C. grew up around an abbey founded in 600 by St. Finbar. The Danes in the 9th c. built the city walls. Dermod Maccarthy, king of Cork or Desmond, surrendered it to Henry II. in 1172. Cromwell besieged and took it in 1649, and Marlborough in 1690. James II. landed at C. in 1688. In C., William Penn, the founder of Pennsylvania, became a quaker, with several of the soldiers of the republican garrison.

CORK, Rock. See Asbestus.

CORLEO'NE, a t. of Sicily, in the province of Palermo, about 21 m. from the city of that name. It is situated on a hill near the source of the Belici, and is well built. Its principal public structures are convents and churches. Its inhabitants, about 15,356 in number, are chiefly engaged in agriculture.

CORM (Gr. *kormos,* a stump)—sometimes called a *solid bulb*—the short and bulb-like subterranean stem of many endogenous plants. It annually produces buds in the form of small corms, either from its summit or its side; and these gradually exhaust and destroy it. In functions, as in appearance, the C. resembles the bulb (q.v.), but its structure is different; it does not consist chiefly of scales, as a bulb does, but of a solid axis covered only with thin membranes. Examples may be seen in the tulip, crocus, gladiolus, colchicum, and arum. When a C. produces young corms from its summit, as in the crocus, they approach in a few years the surface of the soil, however deeply they may at first have been planted.

CORMENIN, Louis Marie de la Haye, Vicomte de, a distinguished French jurist and publicist, was b. at Paris, Jan. 6, 1788. Educated for the law, he was, in 1810, appointed auditor of the council of state, and drew up several of its most important reports. He was elected a deputy in 1828, and from that time until 1846, continued to be re-elected at every election, sometimes by as many as four departments at once. His extensive knowledge of jurisprudence, and of the practical affairs of government, and the clear and logical force with which he could present his ideas alike by speech and writing, soon secured him an immense influence in public affairs. After the revolution of 1848, C. had the honor of being elected to the chamber by four departments, and was nominated president of the commission appointed to remodel the constitution; and in this capacity strongly advocated universal suffrage. He was appointed member of the council of state reconstituted after the *coup d'état.* In 1855, he was elected a member of the Institut. Besides his numerous pamphlets, C. is author of *Etudes sur les Orateurs Parlementaires,* a work which has passed through nearly twenty editions; and of a valuable work on the law of France (*Droit Administratif*). After long silence, C. published, in 1860, *Le Droit de Tonnage en Algérie.* He died at Paris, 6th May, 1868.

CORMONTAIGNE, Louis de, 1696–1752; a French military engineer who took part in some of the most important sieges in the Polish and Austrian wars. He had charge of the line of fortification from Calais to the Rhone, and he built new defenses at Strasburg, Metz, and Thionville.

CORMORANT (*phalocrocorax;* Fr. *cormorant;* Ital. *corvo marino;* Bret. *morvrau,* a sea-crow; Welsh, *mor,* sea, and *brau,* a crow), a genus of web-footed birds of the family *pelecanidæ* or *totipalmati,* having, like the rest of that family, the hind-toe united in a

single membrane with the other toes; and also characterized by a bare dilatable membrane beneath the lower mandible, extending to the upper part of the throat, but not forming a great sac on the throat, as in the pelicans; a compressed bill, rounded above, and with a strong hook at the point of the upper mandible; the nostrils linear, and seemingly impervious to air; the claw of the middle toe serrated, apparently in order that it may be used in trimming the plumage; the wings of moderate length; the tail-feathers stiff and rigid, and used to aid in walking or climbing. The species are distributed over the coasts of most parts of the world, some of them occasionally ascending rivers in pursuit of fish, on which all of them exclusively live, and even visiting inland lakes. They are proverbial for their excessive voracity. They do not take their prey by diving when on wing, but pursue it by swimming and diving, using their wings in progress under water, and descend to a wonderful depth; the smaller of the two British species has been caught in a crab-pot fastened 120 ft. under water. When the prey has been caught in a manner inconvenient for swallowing, they toss it in the air, and adroitly catch it as it descends. Some of the species frequent high rocks, others low islands, on which they make rude nests, chiefly of sea-weed; some perch and even build their nests on mangroves and other trees. Their eggs are covered with a calcareous incrustation. The flesh of all the species is dark and of a fishy taste, but is sometimes used as food, particularly that of young birds. The British species are the common C. (*P. carbo*), which is mostly of a black color, but for a short time during the breeding-season exhibits a sprinkling of longish white, almost bristly feathers on the head and back of the neck; and the green C. or shag (*P. graculus*), which is of smaller size, and of a prevailing dark-green color. The common C. is about 33 in. long. It is a very widely distributed species. It was formerly sometimes tamed in England, to be employed in catching fish, and is still trained to this use in China.

CORN (Ger. *korn*) meant primarily any small, round, hard body, like a seed. This general meaning is still seen in its application to concretions on the feet. It is allied to the Lat. *granum*, grain; and to Ger. *kern*, kernel. As usually applied, C. is a generic name for all seeds used in making bread, especially the seeds of cerealia. But it has also a specific sense, and denotes in any country that grain which furnishes the prevalent breadstuff of the people. Thus, in England, C. means *wheat;* in America, it means *maize;* and in Scotland, *oats.*

CORNA'CEÆ, a small natural order of exogenous plants, containing about 40 known species, chiefly trees and shrubs, with a few herbaceous plants. The leaves are simple, without stipules; the flowers in heads, umbels, or corymbs. The calyx is 4-lobed or 4-toothed; the petals 4, equal, oblong, broad at the base, inserted into the upper part of the tube of the calyx; the stamens 4, alternate with the petals; the ovary is adherent to the tube of the calyx, 2 to 3-celled, crowned by a disk; the ovules solitary; the style filiform; the stigma simple; the fruit is fleshy and drupe-like. The C. are natives of the temperate parts of the northern hemisphere. The fruits of some are eatable; the bark and leaves of some are medicinal; some are valued as ornamental plants. CORNEL, DOGWOOD, AUCUBA, and BENTHAMIA are examples.

CORN APHIS, or WHEAT APHIS, *Aphis granaria*, a species of *aphis* (q.v.), or plant louse, which is sometimes injurious to corn-crops, appearing in great numbers on the ears, sucking the juices of the plant, and so impoverishing the grain. It infests wheat, barley, and oats. The male is green, the female dull orange.

CORNA'RO, CATERINA, 1454–1510; a queen of Cyprus. She succeeded her husband, who had acted as regent until 1473. After a troubled reign of 16 years, she abdicated in favor of the Venetian republic. Titian painted her portrait, and her history has been a favorite study for romance writers.

CORNA'RO, LODOVICO, a Venitian nobleman, b. 1467, is remembered on account of his instructive example of temperance. His constitution, naturally not strong, was greatly injured by intemperate eating and drinking, with other excesses; so that, when 40 years of age, he appeared to have little hope of prolonged life. At this time he adopted strict rules of temperance both in meat and drink, which, co-operating with his general care of health and gentle exercises of various kinds, served to extend his life to nearly 100 years, as he died, according to the best authorities, in 1566. His old age was remarkably cheerful. To promote those habits which had proved so advantageous in his own case, he wrote, in his 83d year, his celebrated treatise, *Discorsi della Vita Sobria* ("Essay on Temperate Living"), which was first published at Padua in 1558, and has been translated into all European languages. The best English translation is one bearing date 1779.

CORN BEETLE, *Cucujus testaceus*, a minute beetle which inhabits granaries and mills, and of which the larva often does much mischief, feeding, like the weevils, on grain, particularly on wheat. The perfect insect is of a bright fulvous color; the larva ocherous, with a forked tail.

CORNBRASH, a member of the lower oolite, consists chiefly of a rubbly cream-colored limestone in thin layers, always nodular and concretionary, each fragment having a deep red coating. Occasional beds of clay occur interstratified with the limestone. The whole thickness of the group rarely exceeds 15 feet. The C. is extremely rich in

echinodermata and mollusca, with the exception of cephalopoda, the abundant oolite genus belemnites being unaccountably wanting.

CORNBURY, EDWARD HYDE, Lord, d. 1723. He was grandson of Edward Hyde, first earl of Clarendon, and one of the earliest among the household troops to desert from the service of James II. William III. made him governor of the province of New York, where he arrived in May, 1702. His administration was rapacious and disgraceful, and after six years he was removed. He was for a long time under arrest by his creditors, but was relieved on the death of his father, when he succeeded to the title and estates.

CORN CRAKE. See CRAKE.

COR'NĔA, one of the coats of the eye; so called from its resemblance to horn (Lat. *cornu*). See EYE.

CORNEILLE, PIERRE, the creator of French tragedy, was b. June 6, 1606, at Rouen, where his father was an advocate. He himself studied for the legal profession. A love adventure, in which he became the rival of a friend, first prompted C. to write verses, and *Mélite*, the comedy founded on this incident, was performed with success in 1629. It was quickly followed by other dramatic pieces: *Clitandre; La Veuve; La Galerie du Palais; La Suivante;* and *La Place Royale*—all so successful that a special theatrical company was formed for the performance of C.'s pieces. In 1635, appeared his *Médée*, a declamatory drama, written in imitation of Seneca. Cardinal Richelieu, who aspired to be the Mæcenas of the stage, kept in his pay a number of writers for whom he dictated plots, and wished to number C. among his retainers; but C. was so audacious as to alter the plan of a comedy, and thus lost the cardinal's favor. He now returned to his native place, where M. Chalon, once secretary to Maria de' Medici, suggested that he should turn his attention to tragedy. As the English drama was not known, or at least not relished at that time beyond the limits of England, C. acquired the Spanish language that he might be enabled to study the Spanish drama, the only other of any consequence in Europe. The result was the *Cid* (1636), which was received with enthusiastic applause. Cardinal Richelieu alone seemed to find no merit in this drama, and induced the academy to publish a critique in some respects unfavorable. In his next celebrated piece, *Horace* (1639), C. endeavored to vindicate his claim to creative genius, which had been questioned by his enemies; but *Cinna* (1639) has been regarded by some French critics as C.'s masterpiece, though others might be disposed to award this honor to *Polyeucte* (1640). In the *Mort de Pompée* (1641), though there is something dignified in the style, it occasionally passes into bombast. The comedy of *Le Menteur* (1642), partly taken from Pedro de Roxas, has natural truth and humor. C. now seems to have exhausted his resources, and his later pieces are almost all forgotten. Of his thirty-three dramas, only a few have kept their place on the French stage. Nevertheless, his countrymen call him *Le grand Corneille*, although Voltaire, who edited an edition of his works, and Laharpe have expressed themselves in some respects unfavorably regarding his genius. The faults of conception in several of his pieces were pointed out by the sharp criticism of Lessing. A. W. Schlegel also spoke in such a way as to provoke hot replies from the wounded pride of the French littérateurs. C.'s chief merit lies in his dignity of style, and in a certain declamatory grandeur of sentiment, which his countrymen have been accustomed to consider truly epical, and which it is now impossible to convince them as nearly resembles rant as it does sublimity. C. died Oct. 1, 1684. The best edition of his complete works was edited by Renouard (12 vols., 1817).—C.'s brother, Thomas (born 1625—died 1709), also acquired a reputation as a dramatic writer.

CORNEILLE, THOMAS, 1625–1709; brother of Pierre, and 20 years younger. At an early age he developed a facility for rhyming, and naturally followed his brother's steps. From about his 22d year he produced plays in rapid succession, occasionally with the help of Pierre, but for the most part alone. At his brother's death, he succeeded to the vacant chair in the academy. He then turned his attention to philology and translation, producing a dictionary intended as a supplement to that of the academy. This was followed by a complete translation of Ovid's *Metamorphoses*. Seven years afterwards he lost his sight, but this did not stop his work, for he soon produced in three folio volumes a *Geographical and Historical Dictionary*. Some of his works were remarkably successful. His *Timocrate* had the longest run of any play in the century, and for *La Dévinesesse* he received 6,000 livres, the largest sum known to have been paid by an author from a single piece; and finally one of his pieces, *Le Barondes Foudrières*, had the distinction of being hissed off the stage.

COR'NEL, or CORNE'LIAN CHERRY, *Cornus mas*, the *cornus* of the ancients, a tree or shrub of 15 to 20 ft. high, of the natural order *cornaceæ*, a native of the middle and s. of Europe, and of great part of Asia. It is not found wild in Britain, although it is common in shrubberies, and was formerly much cultivated as a fruit-tree, as it still is in Germany and other parts of Europe. It has oval leaves, and small yellow heads of flowers, which appear before the leaves in spring, and which abound in honey, and are much frequented by bees. The fruit is oblong, a little larger than a sloe, shining, red, or rarely yellow or white. It is late in ripening, and until quite ripe is very austere; but when perfectly mellow, has an agreeable vinous acid taste: it is either eaten as

it comes from the tree, or is made into a preserve, which is said to be tonic, and useful in diarrhœa. When gathered unripe, it is pickled like olives. It was formerly also fermented for a beverage. In Turkey, it is still much used in making sherbet. The wood of the C. is extremely hard and tough, and well adapted for those purposes of joiners and turners to which the size of the tree will admit of its application. It is used for making mathematical instruments.—DWARF C. (*C. suecica*), a native of mountain-pastures and bogs throughout the n. of Europe and in Britain, is a plant about six inches high, with creeping root, sessile ovate leaves, each stem producing a single umbel of a few purple flowers, followed by small sweetish red fruit, which is tonic, and has the power of remarkably increasing the appetite, whence the plant has received a Gaelic name, signifying *plant of gluttony*.—Dogwood (q.v.) belongs to the same genus.

CORNELIA, one of the greatest women in Roman history, was the younger daughter of Scipio Africanus the elder, the conqueror of Carthage, and mother of the great tribunes, Tiberius and Caius Gracchus, and of Cornelia, the wife of Scipio Africanus the younger. On the death of her husband, refusing numerous offers of marriage, including even one from king Ptolemy, she devoted herself to the education of her children, a task for which her lofty spirit and wide attainments rendered her admirably fitted, and which had extraordinary results. The only attack ever made upon her lofty reputation was the charge that she was concerned in the death of her son-in-law, Scipio, which was, there is no reason to doubt, a base slander. On her death a statue was erected to her memory bearing the inscription—"Cornelia, Mother of the Gracchi." To a Campanian lady who asked to see her jewels, she is said to have presented her sons as the only jewels of which she could boast. After the murder of Caius, the second of her sons, she retired to Misenum, where she devoted herself to Greek and Latin literature, and to the society of men of letters.

CORNELIUS, ELIAS, D.D., 1794–1832; a native of New York, graduated at Yale, 1813, and studied theology under pres. Dwight, and afterwards under Dr. Lyman Beecher. He was licensed to preach in 1816, and was appointed agent for the American board of commissioners for foreign missions. He was sent to the southern states to raise funds to establish missions among the Indians, and while on his way to the Chickasaw nation he redeemed, from a band of Cherokees, a white girl, whose mother had been killed. He provided for the child, and subsequently wrote her history in *The Little Osage Girl*, which became a popular Sunday-school book. From 1819 to 1826, he was pastor of a Congregational church in Salem, Mass., and in the latter year was appointed secretary of the American education society. In 1829, he was chosen professor of divinity in Dartmouth college, but he declined the place. In 1832, he became secretary of the American board of commissioners for foreign missions.

CORNE'LIUS, PETER VON, one of the first masters of the modern German school of painting, was b. at Düsseldorf, 23d Sept., 1787, and studied under Langer in the academy of his native town. When only 19 years of age, he painted some remarkable frescoes for the cupola of the old church of Neuss. Four years later, he gave still more unmistakable proofs of a creative fancy in his illustrations of Goethe's *Faust*, and the *Nibelungen Lied*. In 1811, he went to Rome. This journey exercised a profound influence on the whole of his future career. The great importance of the early masters became ever clearer to him as he studied their choicest productions. He gained a wide reputation, while at Rome, by two cartoons, "Joseph's Interpretation of the Dream," and "Joseph's Recognition of his Brethren." In 1819, he was called to Munich, and entered the service of the then crown-prince of Bavaria. Here he remained till 1841, and executed those grand works on which his fame mainly rests, and which may be divided into two classes, pagan and Christian, the former of which comprises the large frescoes in the saloon of the Glyptothek, all illustrating stories of the Greek gods and heroes, as also representations of several Hesiodic myths, and of the various incidents of the Trojan war; while the latter, or Christian series, begun after the completion of the former in 1830, consists of frescoes on New Testament scenes, extending from the "Incarnation" to the "Judgment," and decorate the "Ludwig's church" in Munich, which was built for the purpose of affording scope for the genius of Cornelius. The "Judgment" is the largest fresco in the world, larger even than Michael Angelo's "Judgment" in the Sixtine gallery. In 1841, C. was invited by the king of Prussia to Berlin, where he was appointed director of the Berlin academy. Among his productions in the Prussian capital are the frescoes for the Campo-Santo, or royal burial-place. Opinion is divided regarding the merits of Cornelius. By his own countrymen he is extremely admired; French critics, on the other hand, regard him as more a thinker than an artist, sacrificing to his conception both truth of color and expression. He is admitted to have been a profoundly creative genius, but *not* a painter. He formed, however, a numerous school, from which have gone forth many illustrious pupils; but he lived to see it losing hold on public sympathy. He died in the 80th year of his age, 6th March, 1867.

CORNELIUS NEPOS. See NEPOS.

CORNELL', EZRA, 1807–74; founder of the Cornell university at Ithaca, N. Y. He was b. in Westchester co., N. Y., and was among the earliest to appreciate the

great value of the electric telegraph, in the promotion of which he accumulated a large fortune, the greater portion of which went toward the establishment of the noble institution bearing his name. His son ALONZO B. was elected governor of New York in 1879, to hold office for three years.

CORNELL' UNIVERSITY, at Ithaca, Tompkins co., N. Y., went into operation in 1868 as an unsectarian institution. Its charter provides that no officer or student shall be admitted or excluded on any religious or political opinions, and that at no time shall the majority of the trustees be of one religious sect or of no religious sect. Its foundation was partly the land-scrip, representing 990,000 acres, which had been received by the state of New York from the national government under the land grant of 1862; and partly a donation of $500,000 by Mr. Ezra Cornell, of Ithaca; with additions by trustees McGraw, Kelley, Selby, and Sage, and president White. Eleven courses of study lead to degrees, viz.: agriculture, architecture, arts, chemistry and physics, civil engineering, literature, mathematics, mechanics, natural history, and philosophy. Those not studying for degrees choose their own course. Five large buildings are devoted to the uses of the university. A sixth is rented to students and others. Sage college is a boarding-hall for lady students, and Sage chapel is a beautiful building devoted to religious services. The grounds, comprising 258 acres (of which 135 are used as a farm by the agricultural department), are beautifully situated upon the upland e. of the village of Ithaca, 400 ft. above Cayuga lake, are valued at $94,000, and the buildings at $570,000. The annual income of the university is about $100,000. There is a laboratory for anatomy, one for botany, one for general chemistry, one for agricultural chemistry, and one for each of the departments of entomology, geology, mechanic arts, and physics. Among the collections are 187 Rau models of plows from the royal agricultural college of Würtemberg, the Auzoux veterinary models, models of plants in *papier mache*, the Sandwich islands herbarium, the Jewett collection of fossils, a collection of Brazilian Indian antiquities, the Silliman collection of minerals, the Newcomb collection of 25,000 species of shells, a collection of 850 architectural photographs, and collections of models in architecture and free-hand drawing. The library contains 37,024 bound volumes, and 12,970 pamphlets. On the 1st of Jan., 1880, there were 43 professors and assistant-professors, 8 instructors, 435 students, and 622 alumni. Twenty-five professors and assistant-professors and 7 instructors are engaged in teaching scientific branches; 17 professors and assistant-professors and one instructor in teaching literature, history, and philosophy; and one professor in teaching military science and tactics. During the year ending Aug., 1879, there were 160 classical or partially classical students; 166 strictly scientific, and 158 partially scientific—total, 484. Women are admitted on the same terms as men, except that the former must be 17 years of age. After becoming students, all are upon exactly the same footing, except that women are excused from military drill or its substitute. The first-year class is required to drill two terms of the year three times a week. The three other classes are required to take the same drill or to take extra university work equivalent to two recitations a week. There is no preparatory department. There are no compulsory religious exercises of any kind, nor is any religious test allowable in any case. There is, however, a fund of $30,000 for the support of Christian preaching in the chapel, and, except in winter, the pulpit is regularly supplied by the best preachers of the various Christian denominations in turn. Each of the assembly districts of the state (128 in all) may send yearly one student for four years' free tuition; the choice to be made by competitive examination from the best scholars, male and female, in the different academies and public schools, but subject to the usual entrance examination at the university.

CORNET, a stop, or series of pipes, in an organ, intended to imitate the tone of an obsolete wind-instrument which has been superseded by the oboe. The CORNET-A-PISTON, a modern wind-instrument of the trumpet kind, is generally made of brass, has two or three valves, and in brass bands takes the soprano and contralto parts. It was first introduced in France as an orchestral instrument. Its tones are less powerful, but far more easily manageable than those of the trumpet.

CORNET (Ital. *cornetta*, a small flag) was, until 1871, the lowest grade of commissioned officer in the cavalry, equivalent to *ensign* in the infantry, his duty being to bear the standard. With the lieutenant, he assisted the captain in the daily duties connected with the troop to which he belonged. There were as many cornets in a cavalry regiment as there are troops. A C.'s commission used, in the days of "purchase," to cost £450; but much larger sums were habitually paid, varying according to the celebrity, or rather the fashionable character of the corps. The pay was 8*s.* per day, with 1*s.* or 1*s.* 6*d.* extra for field allowance. The half-pay varied from 2*s.* 6*d.* to 3*s.* 6*d.* The pay being utterly inconsistent with the price paid for the commission, none but wealthy men could enter the cavalry. In 1871, the rank was abolished, sub-lieutenants (who are merely probationary lieutenants) being substituted.

CORNE'TO, a t. of central Italy, about 12 m. n. of Civita Vecchia, occupying a commanding eminence on the left bank of the Marta, and 2 or 3 m. from the Mediterranean, over which it has an extensive view. C. rose out of the ruins of the Etruscan city of *Tarquinii*, and is enriched by some of its monuments. It was erected

into a city by Eugenius IV. in 1432; but the picturesque old battlemented walls and towers which surround it are said to belong to an earlier period. During the faction-wars of the Guelphs and Ghibellines, this city maintained a firm allegiance to the popes. Pop. 5,000. The remains of Tarquinii (perhaps the most interesting in existence to the student of Etruscan history, as it is from the tombs here that most of our knowledge as to the games, costumes, and religious customs of this remarkable people has been derived) lie about a mile and a half from Corneto. The Necropolis of Tarquinii covered 16 sq.m., and it has been estimated on high authority that it could not have contained less than 2,000,000 tombs. Of this vast number, some 2,000 have been opened within recent years. Among the most noteworthy of these are the Grotta delle Iscrizioni, the Grotta delle Bighe, Grotta del Barone, Grotta Francesca, Grotta del Cardinale, Grotta del Triclinio, and Grotta della Querciola. Treasures from this mine of Etruscan wealth, as it may be called, enrich the British museum, and other important collections in Britain and on the continent.

CORN FLY, the common name of a number of small dipterous (two-winged) insects, of the large family *muscides,* particularly of the genera *chlorops* and *oscinis,* which do great injury to corn crops. The most destructive in Britain is *chlorops tæniopus,* a fly about a line and a half in length, of a pale-yellow color, with black stripes, which deposits its eggs between the leaves of young plants of wheat or barley. The maggots living on the juices of the plant produce the disease which, from the swelling of the joint, is called *gout;* and the plant, impoverished, either produces no ear, or an imperfect and partially shriveled one.

CORN GROUND BEETLE, *Zabrus gibbus,* an insect of the order *coleoptera,* section *pentamera.* It is about six lines in length, of a shining pitchy black color, with rusty jaws and legs, very broad and convex, the wings large, the antennæ short and slender. It burrows in the ground, climbs the stalks of wheat and barley by night, and devours the ears. The larva is of a remarkable appearance, whitish, with brown head and thorax, and a brown stripe down the body, powerful jaws, six thoracic legs, and little tufts of hair along the sides of its elongated tapering abdomen. It burrows in the earth, and eats the stems of corn close to the surface of the ground.

CORNHERT, or KOORNHERT, DIEDRIK, 1522–90; a Dutch writer on politics and theology. He was secretary to the burgomasters of Amsterdam in 1564, and active in opposing Spanish tyranny, being the author of the manifesto which the prince of Orange published in 1566. He was imprisoned by the government, but escaped to Cleves, where he maintained himself by his art of engraving on copper. When the states became free he returned, and was made secretary of state. He was a famous theologian, and held controversies with both Roman Catholics and reformers, but refused to join either side.

CORNICE. In classical architecture, the C. is the uppermost member of the entablature, surmounting the frieze. Each of the orders has its peculiar C.; but these, with their relation to the other portions of the entablature, will be better understood when explained in conjunction with that term. See ENTABLATURE. In the Gothic styles, the form of the C. varies greatly. "In the Norman style," says Parker, "a plain face of parapet, slightly projecting from the wall, is frequently used as a C., and a row of blocks is often placed under it, sometimes plain, sometimes molded or carved into heads and other ornaments, when it is called a corbel table." These blocks have commonly a range of small arches over them. In some cases a small plain string is used as a cornice. The corbel table continued to be used as a C. in the early English style; but it was generally more ornamented than in the Norman, the arches being commonly trefoils and well molded. The blocks are frequently ornamented with a head, or other figure characteristic of the style. Sometimes a range of horizontal moldings is placed above the arches of the corbel table, and sometimes the C. consists of simple moldings, without any corbel table.

The term C. is also used, in a general sense, to signify any horizontal molded projection, terminating a building, or the component parts of a building. It is in this sense that we speak of the C. of a room.

CORNICHE. See RIVIERA.

CORNIF'EROUS PERIOD, the second of the five great divisions of the Devonian or old red sandstone age, in American geology. It was the great limestone period of America, and contains the upper Helderberg, the Schoharie, and the Cauda galli epochs.

CORN, INDIAN. See MAIZE, *ante.*

CORNING, a t. and village in Steuben co., N. Y., on the Chemung river, and the Erie, the Corning and Blossburg, the Buffalo and Corning, and the New York railroads; 13 m. w. of Elmira; pop. '75 (township), 6,796. The principal trade is in coal and lumber, great quantities of the latter being floated down the Susquehanna. There is also water communication with the Erie canal.

CORNING, ERASTUS, 1794–1872; b. Conn.; early settled in Albany, N. Y., as an iron merchant, where he accumulated a large fortune. He was a member of congress from 1857 to 1863, and again in 1865–67. He was for many years one of the great railroad owners and operators of the country.

CORNISH LANGUAGE, a form of speech allied to Welsh and Armorican; not a living language since the beginning of the century. It seems to have been in use in Cornwall and w. Devonshire, Eng.

CORN LAWS, the name popularly given to certain statutory enactments which had for their object a restriction of the trade in grain. The English C. L. date as far back as the year 1360, in the reign of Edward III. Before this period, there seems to have been a general rule carried into effect by the crown against the exportation of any grain; and the act of 1360 enacts the prohibition, but at the same time excepts Calais and Gascoigne, with any other places which the king may appoint by license, from its operation. In 1393, the arrangement was reversed, and the right to export was made general, unless to those places to which it was prohibited by royal proclamation. An act of 1436 permitted exportation when the price of wheat did not exceed 6*s.* 8*d.* per quarter. Hitherto, there seem to have been no prohibitions against importation; but in 1463, an act was passed prohibiting it so long as the price at home was below the 6*s.* 8*d.* at which there was free exportation. The next change was in the reign of Henry VIII., when an act of 1534 prohibited all exportation except by license specially granted under the great seal. This act was not found to work well; and 20 years later, the previous arrangement was adopted of allowing exportation when the price had reached a certain point. The subsequent legislation for some time merely changed the price at which exportation might begin, generally enlarging it. After the restoration, the policy of increasing the duties on importation, for the protection of agriculture and the landed interest at home, begins to be perceptible. At the same time, the effect of that event on the condition of Scotland and England towards each other forms a curious illustration of such fiscal regulations. Under the protectorate, they were one country, with free intercommunion of trading privileges. Scotland was increasing in wealth under this arrangement; but the countries were separated by the restoration of Charles II., and became the same to each other as foreign nations. The English duties restricted the importation of grain from Scotland; and in 1663, the Scotch parliament, in retaliation, laid heavy duties on the importation of English and all other foreign grain. Had not the union of 1707 made the countries one again, England and Scotland would probably have continued a corn-law contest against each other, like the French provinces.

The agricultural interest continuing powerfully to modify this department of legislation, an act was passed in 1670, for virtually prohibiting importation, until the home price had reached 53*s.* 4*d.*, and laying a heavy duty on it above that point. This law had, however, little effect in favor of the landed interest, from the circumstance, that then, and for long afterwards, Britain was an exporting, not an importing country—that is to say, it generally produced more corn than its population required. A new device was adopted at the revolution, and a bounty was awarded on exportation—that is, a sum was paid to the producer for what he exported, so that if the price in the foreign market might not induce him to send corn abroad, the bounty, in addition to that price, might. For upwards of a century, the numerous enactments in this department will be found to be a mere shifting, according to circumstances, of the incidence of the bounty on the one hand, and of the import duty on the other. In 1773, a permanent adjustment was supposed to be reached by Burke's act, which removed the bounty, and prohibited exportation when the price reached 44*s.*, and allowed importation at a nominal duty of 6*d.*, at a price of 48*s.* Afterwards, and especially during the great war of the French revolution, it became usual to profess that the chief object of this kind of legislation was to have always a sufficient supply of grain at home for our own wants, and to render us entirely independent of foreign nations for the food of the people. It was maintained that the bounty effected this object, since its tendency was to promote the production of more grain than was necessary at home, and it thus supplied a garnary to be drawn upon in case of famine. It was otherwise, however, maintained, that the prohibiting, or, at all events, restraining the introduction of foreign grain, would give a much greater impulse to home production. Looking at it from the agricultural interest solely, this view was well founded; for, as the tendency of Britain to be an importing rather than an exporting country was increasing, the exportation, even with the encouragement of the bounty, was likely to be small. It could not, however, escape consideration, that to increase home production by a pressure on importation, was virtually to aggrandize the landed interest by a pressure on the food of the people. With these views, the price at which importation might begin was raised in 1804, and was again raised in 1814, when the bounty was abandoned as worthless for its purposes. There had been a tendency to what is called "a sliding scale" in the duties on importation. This arrangement was brought into systematic shape by the act of 1814, and subsequently, by the celebrated act of 1828, it reached what was considered by its supporters a state of perfection.

Throughout these various changes there were not wanting writers and speakers who denounced the C. L., and agitated for their removal. But the public at large, though conscious that the laws were some way improper, or at variance with the principles of political economy, did not, till the very last, earnestly unite in calling for repeal. There was a powerful party who defended the C. L., and represented, with wonderful plausibility, that these restrictive statutes were identified with the best interests of the coun-

try. Their arguments might thus be summed up: 1. Protection was necessary, in order to keep certain poor lands in cultivation. 2. It was desirable to cultivate as much land as possible, in order to improve the country. 3. If improvement by that means were to cease, we should be dependent on foreigners for a large portion of the food of the people. 4. Such dependence would be fraught with immense danger; in the event of war, supplies might be stopped, or our ports might be blockaded, the result being famine, disease, and civil war. 5. The advantage gained by protection enabled the landed proprietors and their tenants to encourage manufactures and trade; so much so, that if the C. L. were abolished, half the country shopkeepers would be ruined; that would be followed by the stoppage of many of the mills and factories; large numbers of the working-classes would be thrown idle; disturbances would ensue; capital would be withdrawn; and no one would venture to say what would be the final consequences. It cannot be uninstructive to put on record that these arguments exercised a commanding influence over the laboring classes, the small-town shopkeepers, almost all the members of the learned professions, and a considerable section of both houses of parliament. Ignorance, prejudice, and timidity were united with selfishness in maintaining the C. L.; and in point of fact, those who endeavored to represent the impolicy of a restricted trade in corn, were generally set down as little better than mischief-makers. The most surprising thing of all was, that the statesmen who ultimately joined in condemning the C. L., could contemplate no other modification than an ascending and descending scale of duties, according as prices fell or rose in the market. About 1840, there was no term better known than that of the *sliding-scale*. The object of this device was to reduce the import duty as the price of grain increased, for the purpose of virtually prohibiting the importation when the price was low, and encouraging it when the price was high, so that at famine prices grain might come in duty free. By the act of 1828, the price of 62*s.* a quarter on wheat was taken as the turning-point. At that price the import duty was £1 4*s.* 8*d.* For every shilling less in the price, a shilling was added to the duty. When the price rose above this point, a different gradation ruled, the duty decreasing by a larger ratio than the rise. Thus, when the price was 69*s.*, the duty was 15*s.* 8*d.*; and when it rose to 73*s.*, the duty sunk to its minimum of 1*s.* The effect of this fluctuation in rendering the trade a gambling one was, one would think, obvious, and yet it was not acknowledged until it had been proved by a series of ruinous instances. Thus, an importer who, when the price of grain was 73*s.* a quarter, bought a cargo, if the price sunk 4*s.* before he could accomplish a sale, had not only to sell at that reduced price, but with a further reduction of 14*s.* 8*d.* a quarter paid as duty. What was still more important, the supplies to this country being so capricious and irregular, foreign countries did not grow corn habitually for the British market. In 1843, sir Robert Peel tried a modification of the sliding-scale, which did not in the least degree mitigate the hostility to the C. L., the noxious nature of which was now beginning to be better understood. Roused by the addresses of Mr. Cobden, Mr. Bright, and other leaders of the anti-corn-law league (q.v.), the people poured in petitions to parliament; and at length sir Robert Peel, yielding to representations on the subject, and now avowedly a convert to free-trade (q.v.), carried a measure to put an end to the C. L. in 1846.

The results of the repeal are well known. Every evil prognostication has been falsified. The liberation of the trade in corn has not, however, lowered the price of bread to the extent that some persons anticipated. This is accounted for as follows: an increased demand in consequence of the population increasing in numbers, and also improving in means and taste; the cost of freight and other charges virtually protect the home-grower to the extent of several shillings a quarter; and the misdirection of capital from agriculture to manufactures in the United States checks the development of the exports of breadstuffs from that country. The small registration duty of 1*s.* a quarter, maintained till 1869, was abolished in that year; since which time the importation of corn is absolutely free. The substantial benefits arising from the repeal of the C. L. consist in the stimulus given to trade, the removal of apprehensions as to the effects of insufficient harvests, along with a certain modification and less fluctuation in price. The following tables will convey the best illustration of the effects of repeal of the corn laws:

IMPORTS OF FOREIGN WHEAT, CURRENT PRICES OF WHEAT, AND DECLARED VALUE OF ALL BRITISH EXPORTS, FROM 1801 TO 1859.

Average periods of ten years.	Average am't of wheat imported.	Av'r'ge price of wheat during each period.	Average total declared value of all British exports.
	Bushels.	*s.* *d.*	£

An alteration in the mode of making the trade returns prevents us from giving a continuation of these tables. In 1858, the total import of wheat, grain, and flour was 23,200,941 cwts.; in 1872, it was 47,612,896. Between the period 1801-10 and 1841-50, we find an increase in the value of British and Irish exports of £16,674,524. Their value in 1871 was £282,380,726, showing an increase over the average of the period 1841-50 of no less than £224,968,232. The value of British and Irish imports in 1851 was £100,460,433; in 1871, it was £329,855,143, showing an increase of £229,394,710.

TOTAL AMOUNT OF WHEAT AND FLOUR, AND OTHER GRAIN AND MEAL IMPORTED IN 1844, 1849, 1854, AND 1859, DISTINGUISHING THE COUNTRIES WHENCE RECEIVED.

CORN MOTH, *Tinea granella*, a small species of moth of the same genus with the clothes' moths (q.v.). This moth is satiny and of a cream-white color; the superior wings marbled with gray, brown, and black, and when at rest sloping like the roof of a house, their fringe turned up behind like a tail. It abounds in spring and summer, and lays its eggs either among stored grain or in sheaves in the field. The eggs are so small as to be invisible to the naked eye. The larva, or Corn Worm—which, for its voraciousness, is known as the *wolf*—eats into the grain, and attaches grains together by a web. It attacks indifferently any kind of grain; sometimes also books, articles of pasteboard, woolen stuffs, and even wood. Frequent turning of heaps of corn is resorted to for the destruction of the eggs and larvæ, and salt is for the same purpose mixed with corn; the floors, walls, ceilings, beams, etc., of granaries are scrubbed with hot water and soap, or washed with lime and water, sprinkled with vinegar, etc., and lamps are employed to attract and kill the moths.—Another very troublesome moth, also called corn moth, is *butalis cerealella*, which is not yet known in Britain, but is found in some parts of Europe and America.

COR'NO, Monté, or Gran Sas'so d'Ita'lia, a mountain in southern Italy, the culminating peak of the Apennines, in lat. 42° 27′ n., long. 13° 38′ east. It has an elevation of 9,591 ft.; and its summit is covered with snow at all seasons.

CORNPLANTER, d. 1836; Chief of the Seneca Indians, a half-breed, the son of John O'Bail, an Indian trader. He was present at Braddock's defeat, and was one of those who, during the revolution, devastated Wyoming valley. After peace, he became friendly with the Americans, and was, with Red Jacket, a leader and counselor of his people. He was strongly opposed to the use of liquor, and was one of the most eloquent temperance orators of the country. He lived to be 100 years old.

CORN RENT. See Rent, Lease.

CORNS are small hard growths, resulting from an increase in the thickness of the cuticle or epidermis, which is generally caused by the irritation of some excessive pressure or friction on the part. They occur most commonly on the toes as a result of tight shoes. Three varieties of C. are described, viz.—1. *Laminated corns* or *callosities*, in which the hardened cuticle is arranged in layers, frequently of a dark brown color, from the effusion of blood in the deeper layers. 2. *Fibrous corns* (clavi), which are not only fibrous in their early stages, but, as time goes on, sink into the skin, sometimes producing great pain. Frequently, a bursa, or small bag, is formed beneath, to protect the tender subjacent tissues, and if this bursa should inflame, matter speedily forms, and the pain and constitutional irritation becomes severe; at other times, the pressure may cause absorption of the ends of bones, and serious alterations in the condition of a joint. The duty of the chiropodist is to dislodge the imbedded peg of hard cuticle from its socket. Should he cut it across, the fibrous arrangement will present the appearance of "roots," a popular delusion of great value to itinerant corn-doctors. 3. *Soft corns* occur between the toes, and cause much annoyance; they are generally small, and being constantly bathed in perspiration, the cuticle does not harden, as in the other varieties. They sometimes give rise to painful ulcerations.

The treatment of C. consists in the removal of all undue pressure or friction, either by removing the shoe altogether, or protecting the corn by surrounding it with a border of some soft material, as amadou (q.v.) or soft leather: or the hardened cuticle may be softened by the application of some alkaline lotion, and then scraped or filed away: or it may be extracted, as before mentioned. A lotion of soda or potash is often found very useful. The cuticle composing a soft corn should be clipped off with scissors, and a small piece of cotton-wool be placed between the toes. In all serious cases, application should be made to a respectable chiropodist.

C. affects horses as well as men. In the foot of the horse they occur in the angle between the bars and outer crust, and consist in a bruise of the sensitive secreting sole. Two forms of feet are especially subject to them—those with deep narrow slanting heels, in which the sensitive sole becomes squeezed between the doubled-up crust and the shoe; and wide flat feet which, by the senseless cutting away of the bars and outer crust, allow the delicate interior parts to be pressed with all the force of the animal's weight on the unyielding iron shoe. Serum and blood are poured out, whilst the secreting parts being weak and irritable, produce a soft, scaly, unhealthy horn. C. constitute unsoundness; cause a short, careful, tripping gait; are the most frequent source of lameness amongst roadsters; abound in badly-shod horses, especially those with the kind of feet alluded to; and usually occur in the inside heels of the fore feet, these being more especially subjected to weight, and hence to pressure. The discolored spot indicating the recent corn must be carefully cut into with a fine drawing-knife; any serum or blood is thus allowed free vent. If the bruise has been extensive, a poultice will have the twofold effect of allaying irritation, and relieving the sensitive parts by softening the hard unyielding horn. When the injury has been of some standing, and soft faulty horn is secreted, a drop of diluted nitric acid may be applied. On no account must the bars or outer crust be removed; they are required for bearing weight, which may be further kept off the injured part by the use of a bar-shoe. In horses subject to C., keep the feet soft by dressing with tar and oil, or any suitable emollient; pare out the C. every fortnight; use a shoe with a wide web on the inside quarter, and nailed only on the outside; and, if the sole is thin and weak, employ leather pads.

CORN SALAD, or LAMB'S LETTUCE, *Fedia* or *Valerianella*, a genus of plants belonging to the natural order *valerianaceæ*, having a toothed calyx and 5-fid corolla, three stamens, and a 3-locular fruit, crowned with the calyx. The species are annual plants of humble growth, with repeatedly forked stems, and very small flowers, growing in cultivated grounds, etc. Several species, very closely resembling each other, are natives of Britain, and others are found on the continent of Europe. Some of them are frequently used as spring salads, and sometimes as a substitute for spinach, particularly the common C. S. (*F.* or *V. olitoria*), the most abundant species in Britain, the *mâche* of the French, *rapunzcher* of the Germans. It is a favorite salad in France and Germany, although it is mucilaginous, and wants pungency. The lower leaves are somewhat spoon-shaped, the upper leaves oblong. The plant is extremely easy of cultivation, and can be obtained in the very first days of spring, when vegetables are scarce. The VINEYARD SALAD of the Germans (*F.* or *V. carinata*), and ITALIAN C. S. (*F.* or *V. eriocarpa*), are sometimes preferred for their larger leaves or finer flavor.

CORN SAW FLY, *Cephus pygmaeus*, a species of sawfly (q.v.) which sometimes does much mischief in cornfields, particularly to wheat and rye; the female, by means of her ovipositor, laying her eggs in the stems either below the first joint or just under the ear; the larva consuming the inside of the stalk, sometimes perforating the joints, and at last cutting it through near the ground, and undergoing its transformation into the pupa state in the stump which remains. The C. S. is almost half an inch long, of a very slender form, shining black with some yellow markings; the larva is fat, tapering, wrinkled, and yellow. The fly is often to be seen on the flowers of umbelliferous plants.

CORN SNAKE, a non-venomous serpent common in the southern states, of brown color, and sometimes 5 ft. long. It is quite tame, and lives upon mice and other small animals.

CORNSTONE, a pecufiar—often mottled—limestone of the old red sandstone formation of Herefordshire, Shropshire, and South Wales.

CORN THRIPS, *Thrips cerealium*, a minute insect, not quite a line long, often abundant on flowers, and which does much mischief to grain crops, particularly late-sown wheat, insinuating itself between the chaff and the immature grain, which it causes to shrivel; also at an earlier period causing the abortion of the ear, by puncturing the stalks above the joints and sucking the juice. The C. T. is of a shining pitchy black, the body long, the male wingless, the female having four narrow wings, which are fringed with long hairs; the larva is yellow, as is also the pupa, which is active. See THRIPS.

COR'NU AMMO'NIS. See AMMONITES.

CORNUCO'PIA (Lat. *cornu*, a horn, and *copia*, plenty). The horn of plenty—regarding the origin of which several fables are told by the ancient poets—is generally placed in the hands of emblematical figures of plenty, liberality, etc., who are represented as

pouring from it an abundance of fruits, corn, etc. It is frequently used both in architecture and heraldry. On the arms of banks, and other public institutions, it is often represented pouring forth coins.

CORNUTUS, L. ANNÆUS, a Stoic philosopher of the time of Nero, a native of Lybia, but a resident of Rome. He was the teacher and friend of Persius, who left to him all his books and a large sum of money. He took the books, but gave the money to the sisters of the donor. Although a friend of Nero, the tyrant banished Cornutus because he did not like his advice as to the number of books in which he (Nero) proposed to write the history of the Romans. Cornutus was a voluminous writer, but little is known concerning his works.

CORN'WALL, a maritime co., forming the s.w. extremity of England, and the southmost co. in the British isles. It is a peninsular right-angled strip of land, with the apex in the s.w., and is bounded on the e. by Devonshire, with the Tamar between, on the n. and w. by the Atlantic, and on the s. by the English channel. From its Devonshire boundary it runs s.w., narrowing to the Land's End, the westmost part of England, in 5° 41′ 31″ w., it then bends n. to Penzance, whence it sweeps round in a south-eastern direction to the Lizard point, the southmost part of England, in 49° 57′ 30″ south. From thence it follows a north-eastern course to Plymouth sound. Greatest length in a straight line from Welcomb to the Land's End, 81 m.; extreme breadth from Welcomb to Rame Head, 46 miles. Area, 1365 sq.m., of which seven eighths are arable, meadow, or pasture. The surface is irregular, with rapid ascents and descents. A ridge of rugged, bleak, moory hills, rising to the height of from 800 to 1300 ft., run s.w. through the center of Cornwall. From this ridge the country slopes, and the streams flow on each side. The hill valleys are longer and wider on the s. than on the n. side of this ridge, and some of them are picturesque with corn, wood, orchards, rivulets, and meadows. The coasts are bold and rocky, and indented with many headlands and bays. The chief indentations are Plymouth harbor, Falmouth harbor, one of the finest in Britain, and Mount's bay between Lizard point and Land's End. Twenty-four m. off the latter point are the Scilly isles. On the n.w. coast occur shifting sands, often in hills several hundred ft. high. The chief rivers are the Tamar, which runs 59 m. along the e. border, 19 m. being a tidal estuary, ending in the noble roadstead of Plymouth sound; the Fal, which runs 20 m. s., 10 m. being tidal, and ends in the fine harbor of Carrick road, near Falmouth; and the Allan or Camel, 29 m. long, 8 being navigable. Woods, meadows, arable land, and 140 parish churches, are said to have been submerged between Mount's bay and the Scilly isles. Old red sandstone, the "killas" of the miner, covers above three fourths of C., and is intersected by three large masses of granite in the interior of the county, with one around Land's End, and by porphyry veins and dikes, some being 50 or 80 fathoms thick, and also by limestone beds. The granite on the hills is often worn by the weather into the form of prismatic, cubical, or spheroidal blocks, piled in gigantic cairns. These blocks sometimes form logging or logan stones. Copper and tin veins, generally 1 to 3 ft. thick, but varying from the thickness of paper to 30 ft., and of unknown depth, run through the granite and sandstone, generally from e. to west. Tin also occurs in the gravel; and lead, silver, cobalt, and antimony veins in the sandstone. Lizard point consists of mica-slate, with soapstone veins, and chinastone; and the country around, of serpentine, hornblende, and diallage rocks. Chinastone, or decomposed feldspar of granite, is found near Launceston, and is a chief ingredient in retorts and crucibles made in Staffordshire. In 1874, C. had 78 copper-mines, 16 lead-mines, and 153 tin-mines, producing 2,770 tons of copper, 2,337 tons of lead, and about 9,000 tons of tin. Of iron ore, 45,000 tons were produced. C. yields $\frac{1}{3}$ of the copper and $\frac{9}{10}$ths of the tin raised in the British isles. The great mining district extends from Dartmoor, in Devon, to Land's End, the veins and lodes chiefly occurring in granite, or killas.

The climate is mild, especially in winter, but damp, with almost daily rain. Snow rarely lies above a few days. South-west winds prevail for nine months in the year, and furious gales are frequent. Some plants of the s. of Europe, as the myrtle, tamarisk, and balm of Gilead, flourish in the open air; but fruits do not ripen well. The soil is light, gravelly, or slaty. The land is generally barren in the mining tracts, but fruitful in the valleys and on the coast. The chief crops are barley, wheat, oats, and potatoes; but harvest is generally later than in the inland counties. Near Penzance, however, two crops of potatoes are got yearly. C. is far more a mining than an agricultural county. The pilchard-fishery is very profitable, and employs a large number of people from July to Sept. The only exports are mining produce and fish. Landed property is much divided. The total area of C. is 873,600 acres, or 1365 sq. miles. The census of 1871 gave a pop. of 362,343. About 30,000 persons are employed in the mines. For electoral purposes, C. is divided into an eastern and a western division, each of which returns two members to parliament. C. has ancient British antiquities, such as rude, upright stone blocks, single and in lines, circles, barrows, and cromlechs. Many Roman coins, etc., have been found. There are many Saxon camps and earth-works. C. and the Scilly isles were the Cassiterides or tin isles of the Phœnicians and Greeks. Vortigern made C. a kingdom in 446 A.D. The west Saxon kings subdued it in 650. The Saxons and Danes overran it in the 9th

and 10th centuries. C. has remains o. ancient castles and monasteries. It was erected into a duchy in 1329, in favor of the black prince, eldest son of Edward III., who, with the succeeding princes of Wales, had immense revenues from the county. The dukedom is still held by the prince of Wales, who derives from it a revenue of £80,000, and appoints the sheriffs. The Cornish tongue, a Celtic dialect, became extinct only in the present century.

CORNWALL, a village and township in Litchfield co., Conn., 37 m. w. of Hartford, near the Housatonic railroad; pop. '80, 1583 In 1818, a mission school was established in Cornwall for the purpose of qualifying converts from paganism to preach the gospel to their countrymen. It was discontinued a few years later.

CORNWALL, a t. in Orange co., N. Y., on the w. bank of the Hudson river, a little n. of the highlands, and embracing the village of West Point; pop. '75, 6,572 (including the new town of Highlands). It is a picturesque region, and is much frequented in summer by tourists and sojourners from the cities.

CORNWALL, a t. and port of entry in Stormont co., province of Ontario, Canada, on the n. side of the St. Lawrence river, at the lower end of the Long Sault rapids, 67 m. above Montreal, and on the Grand Trunk railway; pop. about 3,500. There is excellent water-power, and manufacturing is the chief industry.

CORNWALL, Barry. See Procter, Bryan Waller, *ante.*

CORNWALLIS, Caroline Frances, was b. on the 12th July, 1786, and was the younger daughter of the Rev. William Cornwallis, rector of Wittersham and Elam in Kent. Her childhood was precocious; but she escaped the usual fate of precocious children. She lived to a good old age; she was even more remarkable as a woman than as a child; and her mind was growing, if not in vigor, in boldness and freeness, even to the last. Her character, as well as her intellectual powers, appear to have been early developed; and from expressions in her mother's diary, we learn that her premature sensibility at the age of seven caused her relatives no little concern. When she was a little older, she began to produce literary works; and the writing of histories, poems, commentaries, and essays, though not pursued to the exclusion of the ordinary interests of her age, appears to have occupied much of her time, and to have been her chief delight for several years. Some specimens of her juvenile compositions have been included in a volume of her *Letters and Remains*, published in 1864. In character, and in respect of the tastes and abilities which they display, they certainly are very remarkable as the productions of a child. Notwithstanding this early promise, Miss C. was not destined to be an early authoress. She was brought up in the decorous life of an English country parsonage; she was sensible of, and at first, perhaps, was not unaffected by, the prejudice against female authorship which prevailed 30 or 40 years ago. It was not till she was getting old that she began to publish books, and even then she was careful to keep her authorship a secret.

She received the school education usually given to young ladies in her time; a worthless education, as she afterwards thought. She was encouraged by her mother and other friends in supplementing it by severer and more useful studies; but the ill-health of her father, which imposed many duties upon her, and the state of her own health, were considerable obstacles to her progress. Gradually, however, she acquired a thorough knowledge of Latin and Greek, and a considerable knowledge of Hebrew; and made herself conversant with nearly every study which occupies the more thoughtful of men—with philosophy, theology, history, natural science, social science, politics, and even law. In her latter days, her knowledge of most of these subjects was only surpassed by that of men who had taken them for their specialty. From an early age, she carried on a correspondence with many persons whose intimacy was calculated to stimulate and aid her; and a selection from her letters has been published. They are often intrinsically valuable and interesting; and, moreover, they present a curious picture of the progress of her mind and the development of her opinions. In style, they are always excellent, and the subjects treated are very various, and seldom ephemeral. Theology, philosophy, history, politics, and social questions afford the themes she most often discussed with her correspondents. To these letters we are indebted for what little has been made known to us of her life; Miss C. having desired that her life should not be written, and having carefully destroyed the papers which might have supplied the materials of a memoir. As regards religion—the great interest of her life—we learn from these letters how, under the influence of enlarged knowledge and reflection, she gradually drifted away from the narrow orthodoxy in which she had been brought up, and adopted views which some would call more enlarged and rational, others latitudinarian. It is to the study of the Greek fathers, and to the influence of a long residence in Italy, which began in 1826, that she ascribed the complete change which took place in her religious opinions. It is right to say, that while she was bold and fearless in accepting beliefs far removed from those of her age and country, her faith in Christianity became stronger instead of weaker, and that she was always careful not to wound the honest opinions or prejudices of others. Among the most esteemed of her correspondents was Sismondi, who is said to have made her an offer of marriage when she was about

20 years old. The offer was declined, but without causing any abatement of friendship or admiration on either side.

Her first work, *Philosophical Theories and Philosophical Experience, by a Pariah*, appeared in 1842. It was the first of a series entitled *Small Books on Great Subjects*, which she had formed the idea of writing with the help of a few friends. Of the 20 volumes of this series which appeared between 1842 and 1854, nearly all—all the most important—were written by Miss Cornwallis. The subjects discussed were very various—the connection of physiology and intellectual science, ragged schools, grammar, criminal law, chemistry and geology, Greek philosophy, and the history and influence of Christian opinions. The works in which the last-mentioned subject was treated—*The State of Man before the Coming of Christ* (1 vol.), and *The State of Man after the Coming of Christ* (3 vols.)—were the most important of the series. She had designed to add to them one more volume—a survey of the present condition of England, social, political, and religious; but this was never completed. The series attracted much attention in this country, and still more in America; and the books in which Christianity and its influence were considered were so judiciously written, that, though presenting a system of thought and belief entirely different from our orthodox Christian teaching, they were favorably received by many of every religious party. These are still the best short and popular account we have of subjects of great interest and importance, of which the majority of the clergy even were profoundly ignorant 20 years ago. In illustration of the ignorance which prevailed amongst Anglican clergy at a time still recent, Miss C. used to say that she once met a clergyman who had never heard of the fathers; and that among a multitude to whom she applied for information about their writings, not one knew anything about them. Besides the *Small Books on Great Subjects*, Miss C. published, in 1847, *Pericles, a Tale of Athens*, which good judges have declared to be an admirable picture of Athenian life; and in 1853, she published a prize essay on juvenile delinquency.

From an early period of her life, her health had been infirm; in her later years, it was very precarious, and she was for the most part confined to bed. She lived latterly at Ildwells, near Tunbridge Wells. She died there on Jan. 8, 1858. A voluminous author, her name was at her death unknown to the world, and it remained unknown until the publication of her *Letters and Remains*, in 1864. She had two reasons for making a secret of her authorship. First, there was a strong prejudice against female authorship in her young days, and even when she began to write; and she feared not the ridicule or scorn, but the neglect which might await her books were it known that they were written by a woman. She wrote in the hope of doing some good, and she concealed her name, that her purpose might not be frustrated. Secondly, she wished to show the world what the female intellect was capable of, and the concealment of her name made her secure of impartial criticism. She believed firmly that the intellects of women were not inferior to the intellects of men, and that their apparent inferiority was entirely the result of inferior training. She regarded the praises bestowed upon her books, the acknowledgment of the originality, accuracy, and vigor, as a tribute not to herself but to her sex. If the books do not prove the intellectual equality of the sexes, they certainly prove that Miss C. was a very exceptional woman. We know from her letters and from the testimony of her friends, that her masculine brain and a great stock of erudition did not prevent her from affording a beautiful example of the graces and charms of the feminine character.

CORNWAL'LIS, CHARLES, Marquis, an English gen. and statesman, son of the first earl Cornwallis, was b. Dec. 31, 1738, and was educated at Eton and Cambridge. He served as aide-de-camp to the marquis of Granby in the seven years' war; in 1776, was made a col., and four years later, governor of the tower of London. Though personally opposed to the war in America, he accompanied his regiment thither, and with an inferior force gained victories over gen. Gates at Camden in Aug., 1780, and over gen. Greene at Guilford, Mar., 1781. In the same year, however, he was forced to surrender with all his troops at Yorktown, Va. This disaster proved the ruin of the British cause in America, and was the occasion of much dissatisfaction, resulting in a change of ministers at home. C., however, who was high in favor with the king, escaped censure. In 1786, C. was appointed governor-general of India and commander-in-chief, and in this double capacity distinguished himself by his victories over Tippoo Saib, and by his unwearying efforts to promote the welfare of the natives. His measures, however, were far from answering the purposes he intended. He returned from India in 1793, when he was raised to the rank of marquis. Appointed lord-lieutenant of Ireland in 1798 during the time of the rebellion, he succeeded in putting it down, and in establishing order in a manner that gained him the good-will of the Irish people. As plenipotentiary to France, he negotiated the peace of Amiens. Reappointed governor-general of India in 1804, he died at Ghazipore, in the province of Benares, in Oct., 1805, on his way to assume the command of the army in the upper provinces. As a statesman or warrior, C.'s talents did not rise much above respectable mediocrity, but he was upright, diligent, and humane in a more than ordinary degree.

CORN WEE'VIL, *Calandra granaria*, a coleopterous insect of the family *curculionidæ*, which, although a small creature, not quite two lines long, is often extremely destructive

to grain stored in granaries. It is much more common in the southern than in the northern parts of Europe. The perfect insect is of a dark chestnut or reddish pitchy color, with short oval wing-cases, but without wings, the thorax much marked with depressed dots, the head elongated into a proboscis, the antennæ bent at right angles. The female makes a little hole in a grain of corn, and deposits an egg in it, the larva feeds on the farina; and as a single female lays many eggs, and perfect insects are soon produced from them, the mischief, unless counteracted, extends very rapidly. To arrest it, however, has always been found extremely difficult; and the most successful method is said to be that of making a little separate heap of grain, which being left unstirred, whilst the greater heap is stirred very frequently, soon becomes the refuge of the weevils, particularly if it is a heap of barley, of which they are fondest, although they will eat any grain, and there they are killed by boiling water.—Of the same genus are the rice weevil (*calandra oryzæ*), and a large South American insect (*C. palmarum*), an inch and a half long, the grub of which lives in the stems of palms, and is eaten as a delicacy both by Indians and Creoles.

CORO (recently named FALCON), a state in Venezuela on the Caribbean sea and the gulf of Venezuela, the extreme n. part of the republic; 10,253 sq.m.; pop. 99,920. It is drained by many small rivers emptying into the Caribbean sea, one of which, the Tocoyo, is navigable for 120 miles. The soil is sandy and dry, and a large portion is still covered with forests. The principal productions are coffee, corn, cacao, and tropical fruits.

CORO, or SANTA AÑA DE CORO, a maritime t. in Venezuela, capital of the province of Falcon, on the peninsula dividing the gulf of Venezuela from the Caribbean sea, 155 m. w.n.w. of Valencia; pop. 7,000. The town is poorly built, the streets are unpaved, and there are no important public buildings. The climate is hot and unhealthy. The water supply is brought by mules from springs some miles away. There is some trade with the West Indies. This is one of the oldest of the Spanish settlements, having been formed in July, 1527. The town suffered greatly in the Venezuelan war of independence.

COROL'LA, in botany, the inner floral envelope of the greater number of phanerogamous plants; the second of those whorls of modified leaves which form the flower (q.v.). It is in the C. that fine colors and the greatest delicacy and beauty of the flower are in general chiefly displayed. The modified leaves of which it is composed are called *petals*, and are very various in form and number. They are also in very many plants united into a tube at the base, when the C. is said to be *monopetalous;* and this union often extends through their whole length, leaving their number to be discerned merely in the teeth in which the C. (bell-shaped, funnel-shaped, tubular, etc.) terminates. The petals of a flower are either similar, when the C. is said to be *regular*, or they differ in form, often very widely, when it is called *irregular*. They not unfrequently assume remarkable and even grotesque forms. Many petals have appendages of various kinds, as *scales, nectaries, spurs, coronæ* or *crowns*, etc. Petals often consist of a *limb*, or expanded portion, and a *claw*, the narrower part, which is covered by the calyx, and by which the petal is attached, but sometimes the claw is wanting or obsolete, sometimes it is united with the tube of the calyx, so that the petals appear to rise out of the calyx. See CALYX and PERIANTH.

COR'OLLARY, a proposition the truth of which appears so clearly from the proof of another proposition as not to require separate demonstration.

COROMAN'DEL COAST, often vaguely taken as the whole of the w. shore of the bay of Bengal, extends, in its proper acceptation, from point Calimere, in lat. 10° 17′ n., long. 79° 56′ e., to Gondegam, in lat. 15° 20′ n., long. 80° 10′ east. It is pretty nearly co-extensive with the districts of Tanjore, Arcot, Chingleput, and Nellore, comprising, along with Madras and Pondicherry, the grand battle-field of last century between England and France in India. With various estuaries and inlets, it is yet commercially of very little value, not presenting a single safe place of refuge for large vessels. So shallow, moreover, is the water for a considerable distance from the land, that ships of any size are obliged to lie several miles off; while the intermediate space, or at least that belt of it that is nearest the beach, presents a surf in which no ordinary boat can live—the only safe craft being the native catamaran (q.v.).

CORO'NA, in astronomy, the name given to the phenomenon seen around the sun during a total eclipse. This phenomenon is a complex one, and comprises effects due to the sun's surroundings or the various layers of its atmosphere, to the light falling on something between the observer and the sun, and to certain physiological effects in the eye. The solar part of the phenomenon comprises the "chromosphere," a layer of brightly incandescent hydrogen, with other included metallic vapors, which lie immediately over that interior part of the sun which we ordinarily see; the "prominences," or "red flames," which are the local uprisings of the chromosphere; and outside of all, the "coronal atmosphere," which consists, as far as known, of hydrogen less brightly incandescent than that in the chromosphere, and of an unknown substance, the vapor density of which appears to be less than that of hydrogen.

CORONÆ, in meteorology, colored rings seen around the sun or moon through peculiar forms of cloud. See HALO, *ante.*

CORONA (Lat. a crown), in architecture, the drip, or lower member of the projecting part of a classical cornice. See ENTABLATURE. The term C. is also applied to the apse or semicircular termination of the choir, especially by ecclesiastical writers. Hence we hear of "Becket's crown," at Canterbury. C. is also applied in ecclesiastical nomenclature, to a chandelier, in the form of a crown or circlet, suspended from the roof of a church, or from the vaulting of the nave or chapels, to hold tapers which are lighted on solemn occasions.

CORO'NA, or CROWN, in botany, an appendage of the corolla in some flowers; sometimes assuming the appearance of an interior corolla very different from the true corolla, and either divided into parts resembling petals, or consisting only of one piece, and surrounding the organs of fructification like a monopetallous corolla; sometimes assuming very peculiar forms. It is often difficult to determine whether the C. is properly to be regarded as belonging to the row of petals, or to that of stamens. The C. was included by Linnæus under the very comprehensive term nectary. A familiar example may be seen in *narcissus;* forms very different may be seen in *stapelia*, and other genera of the natural order *asclepiadaceæ.*
